### THE OPERATOR'S WOOING.

John Sampson was a "dash"—ing youth,  
He courted Tom Smith's "dot"—er;<sup>1</sup>  
A "space" there was, to tell the truth,  
'Tween Mag and he who sought her.

To "Telegraphic"<sup>2</sup> story, he  
"Coils"<sup>3</sup> first upon her father,  
But Thomas said "ground"<sup>4</sup> and see  
My better half—her mother.

John then "cut out" to find her ma;  
He "quad"<sup>5</sup> scarcely keep his courage;  
He knew she was more "cross" than pa  
(They sometimes are at her age).

When he'd rela(y)ted<sup>6</sup> to the dame  
Their love and wished "connection;"  
A "sunder" answer never came  
To one who sought protection.

"I told 'Magnet'<sup>7</sup> to be too fast,  
But treat you with "pole"—iteness;  
'Condenser'<sup>8</sup> wit to make it last  
And save herself contriteness.

"'Repeater'<sup>9</sup> conversation once;  
'Transmitter'<sup>10</sup> love on paper;  
'Battery'<sup>11</sup> a poor man than a dunce  
Whose sense and wealth is vapor."

"'Ohm' I!" said John, "What joy is this?  
E'en th' 'button switch'<sup>12</sup> I wear  
Will be a 'message' of that bliss,  
When pressed by worldly care.

"Of th' 'rheostadt'<sup>13</sup> we have each day  
'Adjust'<sup>14</sup> amount I'll do;  
'Switch board'<sup>15</sup> bills I have failed to be  
I'll have sent in to you.

"'Single wire'<sup>16</sup> no longer Mag—  
This 'duplex'<sup>17</sup> for the preacher—  
My 'armature'<sup>18</sup> side 'll never fag—  
Come here, my precious creature."

"30."

<sup>1</sup>Daughter. <sup>2</sup>Tell a graphic. <sup>3</sup>Calls. <sup>4</sup>Go round. <sup>5</sup>Could. <sup>6</sup>Related. <sup>7</sup>Mag not. <sup>8</sup>Condense her. <sup>9</sup>Repeat her. <sup>10</sup>Transmit her. <sup>11</sup>Better a. <sup>12</sup>Buttons which. <sup>13</sup>Roast that. <sup>14</sup>A just. <sup>15</sup>Which board. <sup>16</sup>Single we are. <sup>17</sup>Double X—i. e., \$20. <sup>18</sup>Arm at your.

#### II.

ALBERT S. AYRES, OF CINCINNATI.

Albert S. Ayres, the subject of this sketch, adds another to the long list of Ohio men who have achieved greatness in the different walks of life. He was born in Dayton, Ohio, Sept. 9, 1849, and is therefore a trifle over thirty-one years of age. Though yet a young man, over half his life has been spent in his chosen profession, and no member of the craft is held in higher esteem than he whose memoir is thus briefly outlined.

Mr. Ayres made his first bow to the telegraphic

world in the Spring of 1864, at which date he entered the Western Union office at Dayton as a messenger. The office at that time was under the management of Mr. I. H. Kierstead, a gentleman whose wise counsel and careful training

long been a mooted question between telegraphers of the old and new school, but if my opinion is worth recording, I should place it on the side of the former. From the very beginning Ayers developed extraordinary ability as a

ALBERT S. AYERS.

he is indebted for much of the success that has crowned his subsequent life.

At the age of fifteen the youthful mind takes on impressions easily, and the bright-faced lad made rapid progress in both branches of the business, theoretical and practical.

There were several registers in the office, and Ayres first learned to receive on paper. Whether or not the perfection of his clean-cut "Morse" is due to the fact, I am unable to say. This has

rapid and correct sender, and those who knew him in later years, when maturer judgment gave intelligent direction to his sending, may well imagine how fearfully he "roasted" the plugs on the different "way" wires centering in Dayton. The writer was one of those unfortunates, and he vividly recalls to this day the thrill of horror that would come over him as he nervously answered "i i," and attempted to receive his terrific sending by sound.

In the winter of 1867, or less than two years after entering the service, Mr. Ayres accepted a situation in New Orleans. Here he remained a year, gaining marked prominence through the South as a wonderfully clever operator. He next removed to Omaha, where he remained three years. While employed in this office the celebrated telegraphers' strike of 1870 occurred. Mr. Ayres was a member of the League, and, though perfectly satisfied with his situation, chose to sacrifice self-interest to principle and accordingly became one of the strikers. Such was his popularity with the manager, however, that he was immediately, on the conclusion of the strike, reinstated in his old position, without reduction of salary. In our limited space it would be impossible to follow his wanderings in detail. Cincinnati, New Orleans and Omaha are the places that know him best, but he has resided for a greater or shorter length of time in Pittsburg, New York, Boston and Memphis. He is now employed by the American Union Company at Cincinnati. In person, Mr. Ayres is of medium height, solidly and compactly built, an *elegante* in appearance, and of pleasant and agreeable manners. He possesses a pair of coal-black eyes surmounted by heavy, arching eyebrows, which meet the gaze firmly and unflinchingly, and are, perhaps, the best indication of his character—brave, honest and true. He is the only son of a widowed mother, who fairly idolizes him with all the strength of a good mother's affection, and it is a pleasure to state that he has always proved, in every respect, a most generous and dutiful boy.

#### A Review of the Telegraphic World During 1880.

The great features in the American telegraphic year just passed have been the unprecedented prosperity on all sides, the wonderful change for the better in the condition of operators, and the vigorous rivalry between the Western Union and American Union Telegraph Companies.

##### WESTERN UNION AND AMERICAN UNION.

One year ago to-day the American Union had about fifty offices, mostly east of and including Buffalo, and was receiving regular business when offered, though not soliciting any. At this time the Western Union (the American Union not being formally opened for business) reduced the rates between New York and St. Louis from 75 to 60 cents, and between New York and Chicago and other places from 60 to 50 cents for ten words. It was then making a clear profit of half-a-million dollars a month (*Western Union quarterly report, made Dec. 10, 1879*).

At eight o'clock on the morning of Jan. 26, the long-talked-of "American Union" opened for business along its entire line, and then commenced in earnest what has since been known as the "Telegraph War." The American Union practiced some high-handed proceedings in throwing off Western Union lines from certain railroads and substituting their own, notwithstanding that the Western Union had exclusive contracts with those roads. On the other hand, the older company also frequently took the law into its own hands, and, whether countenanced by the officers of the company or not we cannot say, the spectacle of hired gangs of ruffians cutting down and carting away American Union poles, and other unlawful acts, became entirely too frequent.

Notwithstanding these drawbacks, the progress of both companies has been simply marvelous. During the year the Western Union has erected no less than 2,700 miles of poles and

strung 22,000 miles of wire—the largest construction in any one year in its history. The American Union has done even more. On the 15th of May (the first anniversary of its incorporation) it had extended its line as far south as Chattanooga, Tenn., and controlled or owned 50,000 miles of line and 1,550 offices. Since that date it has extended its lines to every important city in America. It has acquired complete working connections, for long terms, with the most important railroads in the United States, among which are the Pennsylvania Railroad and its extensive branches, the entire Wabash system, the Baltimore & Ohio Railroad, and the Union Pacific Railroad. It has also purchased many local telegraph lines in different sections of the country; has leased for ninety-nine years the entire lines of the Dominion Telegraph Company of Canada, comprising nearly 10,000 miles of wire, and has secured a twenty-years' exclusive connection with the new French cable, besides obtaining a working connection with the Direct cable, through the lease of Canadian land lines. Great reductions in rates have followed; we fear rather too precipitately. Ten words from the East to points in Colorado that formerly cost \$2 now cost \$1.25; to New Orleans 75 cents that formerly cost \$1.00, and proportionate reductions to other points. The Western Union maintained its own tariff schedule, regardless of the rates charged by its rival, until last month, when it threw off its reserve, and adopted the lower rates charged by the American Union. It had, however, meanwhile, fought the American Union in the matter of rates with its "dummy," the A. and P. Co.

##### THE COMPANIES IN WALL STREET.

In the Winter of 1879-80 Western Union, following the great rise in the price of other stocks, sold up to 116. When the American Union first showed a disposition to lock horns with it, by displacing its wires from the Union Pacific, the Baltimore & Ohio and other railroads, substituting its own wires therefor, the price of Western Union dropped from 116 to 88 in one month. Under the varying phases of the "War"—such as rumors of a joint-purse agreement, Jay Gould obtaining control of the Western Union, etc.—its stock was kept wavering during the remainder of the first ten months of last year between 88 and 116, no one knowing which way it was going to jump. After the last quarterly report, showing that the reduced dividend (1½ per cent.) absorbed nearly all its surplus, its stock has shown a downward tendency, and it is now quoted at 78½. American Union was not publicly marketed until late in the Fall, when it was first quoted at 60, and now stands at 71¾.

##### THE TELEGRAPH IN THE LAW COURTS.

Owing to the rivalry between the competing companies, the telegraph has been the subject of a great many legal decisions during 1880, none of which, however, have materially changed the situation. The most important legal decision of the year was given by Judge Blatchford in the U. S. District Court, in this city, sustaining the Page patent, a full account of which will be found in THE OPERATOR for March 1, 1880.

##### THE BOOM IN SALARIES.

As might be expected, the revival of trade caused an unprecedented demand for competent operators during the past year, and a consequent increase in salaries, which had previously been reduced to the lowest possible living rate. First-class men, who, prior to the advent of the American Union and the great increase in traffic, had been glad to accept from \$50 to \$75 per month, are now receiving, from either company, from \$75 to \$90, and even up to \$100 per month, with a fair prospect of a still further advance. As an example, it may be mentioned that on the night of the Presidential election, in large towns where every newspaper, every political club and many private parties desired special wires, five dollars a night was offered for the services of operators, without takers.

##### FAST TELEGRAPHING.

Under these encouraging circumstances, with two Presidential nominating conventions in session during the summer, a Presidential election late in the autumn, and several foreign wars in progress, or impending, with the consequent demand for early news on the part of the general public, some remarkably fast telegraphing has

been developed. In a trial of speed by the ordinary Morse system, in this city, Aug. 22nd, for prizes offered by Messrs. J. H. Bunnell & Co., Mr. W. J. Curtis sent 500 words in 11 minutes and 14¼ seconds, his average number of words per minute being 44.79, and his fastest minute 50 words. It might be mentioned here, that, in answer to a challenge issued by Mr. Walter P. Phillips, another contest is pending, with a view to testing the merits of the Phillips, Delany, and Bunnell keys. On the 28th of June there was published, in the second edition of the London *Times*, news of the same day from Sydney, Australia, the telegram reaching London, apparently, five hours before it was sent from the Antipodes. On the 26th of May, the announcement of the result of the Derby race, in England, was sent from London to New York in 25 seconds, actual time. On the 1st of October, at an exhibition of the "American Rapid" system, in Philadelphia, a message of 200 words was sent, in regular Morse characters, in 11 seconds, and another of 500 words in 29 seconds. Thus, while the great increase in business has demanded extra facilities and speed, the various telegraph companies have not been behindhand in responding to the call.

##### NEW COMPANIES.

Several new companies, fired with a commendable zeal to serve the public interest, have been announced during the past year. The American Rapid was formally opened for business, in this city, July 19th, and is now doing a good business, in its limited sphere. The Mutual Union Telegraph Company, projected by bankers and brokers, is still pushing ahead, and is hopeful of success. Other companies, one projected by Henry W. Pope, to do business throughout this State; and another, by Anson Stager and others, to do a telephone business principally between New York and Florida, have been chartered. "The American and European Commercial News Company," incorporated at Trenton, N. J., Dec. 26, 1879, seems to have fallen through.

##### STRIKES.

Only one strike has been reported throughout the telegraphic world, that being in this city, among messenger boys of the American District Telegraph Company. It took place Oct. 6. Some of the lads were promptly arrested; others became disheartened, and the movement fell through, after a few days' experience.

##### HONORS TO TELEGRAPHERS, CHANGES, ETC.

During 1880 Professor A. Graham Bell has received the Volta Prize of the French Academy. Congress has voted \$15,000 for a statue to Professor Joseph Henry, to be placed in the Smithsonian grounds. Professor Elisha Gray has accepted the chair of Dynamic Electricity, at Oberlin College. Mr. George Walker, of the Gold and Stock Company, of this city, has been made U. S. Consul General at Paris, and sailed for the scene of his diplomatic labors in March last. Mr. Abraham Locke, a well-known telegrapher, has been elected Mayor of Nickerson, Kansas; while ex-Governor Marshal Jewell has done good work for his party as chairman of the Republican National Committee. Dr. Norvin Green, President of the Western Union Telegraph Company, was suggested as a candidate for President of the United States, the *Graphic*, of this city, nominating him, and publishing a portrait of the Doctor. Mr. Cyrus W. Field was honored with a public banquet in this city (Oct. 27), prior to his departure on a tour around the world.

Among other important changes and promotions, during the past year, were the following: General Thomas T. Eckert became President of the American Union, Jan. 1, 1880, succeeding Mr. D. H. Bates, who remains with the A. U. as First Vice-President. Mr. A. B. Chandler, on the same day, succeeded General Eckert as President of the Atlantic & Pacific Telegraph Company. Mr. George B. Prescott, for ten years electrician of the Western Union, resigned (April last) to take charge of the G. & S. Co., as Vice-President and Executive Manager. Mr. Frank L. Pope also resigned from the Western Union (in May last) to engage in business for himself, as a patent solicitor. Mr. James Merrihew, Superintendent of the Western Union, Sixth District, has been made Assistant General Superintendent, with headquarters in this city, Assistant Superintendent William B. Gill having charge of the Sixth District. Mr. Frank W.

Jones, formerly Assistant Manager at Chicago, has been made Circuit Manager of all the Western Union lines, with headquarters in this city.

#### DEATHS OF PROMINENT MEN.

Death has been lenient with our leading men during the year just closed. England has lost Sir William Fothergill Cooke, and Mr. Julius Beer, the editor of the *Electrician*. In this country, our most notable loss has been in the death of General Albert J. Myer, Chief Signal Officer, at Buffalo, N. Y., Aug. 24. A well-known inventor, Mr. Charles T. Chester, has also been taken away, dying at his home at Englewood, N. J. France has lost her eminent electrician, M. J. M. Gauguain.

#### TELEGRAPHIC ILL-WINDS.

The elements have granted us a favorable year, but not entirely without disaster. Fires have been rather too frequent to be pleasant, the most disastrous being the burning of the Telegraph Supply Company's building, occupied by the Brush Electric Light Manufacturing Co., at Cleveland, Ohio (May 6), entailing a loss of \$250,000. The Western Union office at Wakenda, Mo., was burned (March 16), and the Dynamo-Electric Company, of Newark, N. J., lost \$12,000 by fire, Jan. 26. At Pensacola, Fla., Dec. 10, a fire which destroyed an immense amount of property also obliterated the Western Union office and the Telephone Exchange. The cable manufactory of Manly & Sons, Philadelphia, suffered by fire to the extent of \$15,000 on the 14th of December. We ought also, perhaps, to mention the loss by fire of Mr. Jay Gould's conservatory at Lindenhurst, entailing a loss of nearly \$200,000. In England, the general office at Manchester was burned (Oct. 24), deranging the entire telegraphic system converging there.

The telegraphic system has suffered severely twice during the past year from violent storms—once in April and again in October. On the former occasion the Pacific coast was cut off from the East for the period of five days.

Lightning has killed a great many people on this continent, and the singular fact has been noticed that male victims have greatly exceeded females. The electric light has killed two men—one in a theatre in England, and the other aboard of the Czar's yacht *Livadia*—and seriously injured several others. A common "shocking apparatus," hawked about by an itinerant showman, has killed a man in New Haven, Conn.

#### THE ELECTRIC LIGHT.

Although very slightly improved during the past year, the electric light has been gradually making its way into public favor. The Jablochkoff light has been introduced in Teheran, the capital of Persia. Mount Vesuvius has been illuminated by the electric light. It has been adopted on many steamships and in various towns on this continent and in Europe. The Brush Company, which has 5,000 lights now in use, has successfully lighted the water front of Montreal, since last July, under a contract stipulating that the light shall always be sufficiently powerful to enable one to read brevier type at a distance of 175 feet. The same company has also extensively introduced the light in this city. From January to January, Edison has confined himself mainly to inventing excuses and his patent medicine, "Polyform."

#### NEW INVENTIONS.

The most interesting invention of the year has been the Photophone, by Professor A. Graham Bell, by which he transmits intelligible sounds through a ray of light, without the aid of wires. For communication between ships at sea, between light-houses and passing vessels, and between stranded ships and the rescuers ashore, this is an invaluable discovery. There has been some talk of the "Diaphote"—for seeing by wire—but nothing has been developed thus far. The Delany Patent Relay—a most ingenious invention—renders telegraphers entirely independent of the Page patent. A patent was issued, July 13, to Mr. Stephen D. Field, for an electric railway, although a similar contrivance has been working successfully in Berlin for some time. For medical science, M. Trouvé has given us the electrical polyscope, for illuminating the internal organs of living bodies. A scheme for automatic repeaters or relays for Atlantic cables has been described, but it was patented fifteen years ago and will probably not be a success now. Phillips' system of

steno-telegraphy has marked the past year for inventions in rapid transmission. Although older than the past year, it was generally brought into notice in September last by the telegraphing in full, from Washington to Cincinnati, of Senator Conkling's speech, containing 16,000 words, in five hours. Three new and improved telegraph keys have been placed in the hands of our operators, the inventions of Messrs. W. P. Phillips, P. B. Delany and J. H. Bunnell, respectively.

#### OUR MUTUAL AID SOCIETIES.

The Telegraphers' Mutual Benefit Association has passed a prosperous year. There were twenty deaths out of a total membership of 2,138, although only eight assessments were made, the remaining fees being paid out of the reserve fund. The total receipts during the past year were \$19,708, and the expenses \$17,548, leaving a balance of \$2,160. The reserve fund is now \$21,000. The "Second Division" numbers 125 members. The Telegraphers' Mutual Aid Society, a local organization, was formed in this city, Feb. 22, and is now in a flourishing condition. It pays \$7 a week to sick members, and \$25 to the heirs of deceased members.

#### TELEGRAPHIC CONVENTIONS.

There were three of these gatherings during 1880. The first was the third annual meeting of the American District Telegraph Companies, at Baltimore, July 12. The other two were held on the 7th of September. They were, the initial convention of the National Telephone Association, at Niagara Falls; and the Reunion of Pioneer Telegraphers' at Cincinnati. About 125 "Old-timers," from all parts of the country, sat down to dinner. The senior telegrapher present was the ever popular James D. Reid, whose telegraphic life dates back to 1845. Speeches appropriate to the occasion were made, and steps were taken toward effecting a permanent pioneer telegraphers' organization.

#### TELEGRAPHIC JOURNALISM.

Our peculiar literature has been greatly stimulated during the past year, and has kept well up with the rapid progress of telegraphy.

The *Journal of the Telegraph*, the organ of the Western Union Telegraph Company, under the able management of the courteous and experienced James N. Ashley, has fully maintained its high standard as a scientific journal, and a record of purely electrical progress.

THE OPERATOR has just completed another year of unprecedented prosperity. On the 1st of July its size was permanently increased to 16 pages, thus giving to America the distinction of publishing the largest telegraphic paper in the world; and it has on several occasions exceeded its own high standard by publishing issues with 20 and 24 pages to each number. Its "National Portrait Gallery," commenced December 1, promises to make a very interesting and popular feature of telegraphic journalism in the future.

The telegraphic world has reported the commencement of three telegraphic journals, two—*The Magnet* and *The Telephonic Exchange Reporter*—on this Continent, and the other—*L'Electricite*—in St. Petersburg, Russia.

America has to record the deaths of two telegraphic papers for the year. The *Magnet*, under the editorial management of Mr. Joseph Christie, came into existence February 14, under the most favorable circumstances, ran helter-skelter through a brilliant career of seven months, sinking a "barl" of money, and, without showing any premonitory symptoms of decay, suddenly dropped out of sight, September 15. The *Magnet* has been gracefully referred to as one of the brightest and most attractive asteroids that ever shot across the telegraphic firmament. The other deceased journal, the *Telephonic Exchange Reporter*, published at Cincinnati, Ohio, made less noise in the world than the cheery *Magnet*, but it was equally well managed, and was much regretted when it went down to join Mr. Christie's pet scheme in the limbo of telegraphic journalism.

Three new books have been placed before the profession in the year just closed. The *American Popular Dictionary*, although not particularly telegraphic in its nature, has been well patronized by the profession. *Telegraphic Tales and Telegraphic History* struck a sympathetic vein everywhere, and the sales have been immense. The third book, Naudet's *Electric Batteries*, was also well received. In the catalogue of new works we ought also, perhaps, to include

Mr. T. D. Lockwood's clever "Notes and Queries," appearing periodically in THE OPERATOR, and which have attracted wide attention for their simple but accurate and sweeping explanations of electrical science.

#### THE TELEPHONE.

Consolidation has been the rule among the telephone people in all directions. During the year a contract has been entered into, harmonizing and consolidating the Gray, Edison, Phelps, Dolbear and other telephone patents controlled by the Gold and Stock Telegraph Company, with the Bell, Blake and other inventions owned by the American Bell Telephone Company. The Western Union, in consideration of turning over at cost some telephone exchanges it had established, secured stipulations in the contract protecting that company against competition in the telegraph business by the licensees of the telephone, and giving to that company an exclusive license to use the telephone for telegraph purposes. The Gold and Stock Telegraph Company and American Speaking Telephone Company surrendered the manufacture and leasing of telephones, and obtained royalties on the gross rentals, amounting to an average of about one dollar per annum on every telephone in use. The effect of the settlement was the termination of expensive and hazardous litigation, securing to the Western Union Company protection from competition and a valuable franchise. Since then, however, the American Union has shown a disposition to question their right to this franchise, and a suit is now pending, in Harrisburg, Penna., in which the American Union Company seeks to force the Telephone Company to put telephones in the American Union, as well as the Western Union offices. This it compelled the company to do in a similar suit some months ago in St. Louis, and also more recently in Columbus, O.

In August last, the Bell Telephone Company, of Canada, closed with the Montreal Telegraph Company for the purchase, for \$75,000, of the latter's telephone business and plant. This gave the Bell Company complete control of all the telephone business of Canada, except in the city of Toronto.

In London, where the British Government has been attempting to freeze out the new enterprise, and has just secured a decision in its favor, to the effect that the telephone is an infringement upon the government monopoly of the telegraph, the Bell and Edison Exchanges have been consolidated under the name of the Metropolitan Exchange.

Many successful long-distance telephoning experiments have been reported, the most notable one being under the direction of Superintendent J. J. Dickey, of the Union Pacific Railroad. On the 25th of January that gentleman successfully worked the telephone from Omaha, Neb., to St. Louis, Mo., a distance of 410 miles. The telephone has also been put to good use in discovering faulty cables, without cutting them for tests, where two or more cables lie in close proximity. After raising one of the cables a telephone test will reveal, by induction, whether or not it is the cable required.

A telephonic service meter has been invented, which enables the exchange to keep a record of the length of time each subscriber uses the telephone, and also the number of times he uses the line.

Opera and sermons by telephone, from theatre and church to private houses, have become rather common during the year.

There have been some gloomy predictions of telephone work injuring the sense of hearing in the operators, but no well authenticated case has yet been reported.

#### POSTAL TELEGRAPHY IN AMERICA.

This Utopian scheme has struggled to the surface three or four times during the year, but its promoters have generally met with but cold comfort. A bill introduced into the National House of Representatives, May 3, to establish a Government Postal Telegraph between Boston and Washington and intermediate points, now slumbers peacefully in the pigeon-holes of the Committee on Post Offices and Post Roads. After the reassembling of Congress, last month, a resolution, by Mr. Morrill, was agreed to in the Senate (December 14), ordering an inquiry as to whether or not the existing telegraphic lines interfere with the business of the Post Office Department, and whether telegraphic service should

not be placed exclusively in the hands of the General Government. Among the vaporings of other impracticable beings on this subject is the recommendation of Postmaster General Maynard, in his annual message to Congress, favoring postal telegraphy.

The National Board of Trade adopted a resolution, at Washington, D. C., Dec. 17, declaring that "the results of the operation of the telegraphs in Great Britain as a part of the postal system of the country are such as to commend the adoption of a similar system to the people of the United States."

#### MISCELLANEOUS EVENTS.

In January a bill was introduced in the Senate by Mr. Saulsbury, defining and establishing the status of communications transmitted by telegraph; and another, with the same end in view, was introduced in the lower house by Mr. Singleton. There was a good deal of talk, as is usual in Congress, upon this subject, but no definite action was taken.

The past year has seen one or two marriages by telegraph, but we have probably heard the last of that peculiar kind of idiocy.

The telegraph has earned the confidence of the public in preserving its secrets, there being only two cases of misplaced confidence reported throughout the world. One of them was plainly an error, but one by which the Western Union placed the originals of two dispatches of one political organization in the hands of its rival. This, however, was one of those lamentable mishaps which may be said to be unavoidable. The other case occurred in Dublin, Ireland—an operator being detected in divulging the contents of a message, for which he was promptly arrested, tried and sentenced to two months in jail.

The telegraphers have not been behind hand in physical exercises, some of them making records in athletic sports nearly equal to the best professionals. In sculling, walking, running and base-ball, the telegraphers have been well up to the front. In this city, May 5, Mr. T. Marrin, from the Western Union office, ran two miles in 12 minutes 14 $\frac{3}{4}$  seconds; and, during the fall, two well-known officials rode bicycles from Saratoga to Philadelphia, by a route which made the distance over 300 miles.

#### OCEAN CABLES.

The chief matters of interest in Atlantic cable affairs during the past year have been the "Cable War," and the great increase in business.

The Compagnie Française du Télégraphe de Paris à New York, better known as "the New French cable," although completed in November, 1879, was only opened for business Jan. 26, 1880, simultaneously with the opening of the American Union Telegraph Company. It commenced business by charging 75 cents per word, the same rate as the old companies. The "war" soon spread, and on the 1st of February the Anglo-American Company reduced its rates to France, and subsequently to Great Britain and Ireland, from 75 to 12 $\frac{1}{2}$  cents per word. In a few weeks the New French Cable reduced its rate to 50 cents per word; the Direct Company followed suit with a 50 cent rate, while the Anglo-American still maintained the 12 $\frac{1}{2}$  cent rate. By June the Direct Company came down to 37 $\frac{1}{2}$  cents per word, leaving the New French Company alone with the 50 cent rate. Cable business then became enormous, the Western Union Company having a quadruplex and duplex at work night and day to North Sydney, and a quadruplex to Duxbury, "feeding" the ocean lines. So the situation remained until October 1, when, by mutual consent, the rate on messages to Great Britain was fixed at 50 cents per word, it being understood that the 12 $\frac{1}{2}$  cent rate to France should continue until December 1.

The year 1880 has seen a great increase in ocean cables all over the world, nearly all of which have been duplexed. The Anglo-American Company has laid a new cable from Valentia to Heart's Content. This cable was laid in the remarkably brief period of eleven days—between August 10 and 21—and is known as "the 1880 cable," although it includes the shore end of the abandoned 1866 cable. During last fall the Anglo-American also laid a new three-conductor cable between Placentia Bay, N. F., and Lloyd's Cove, C. B.

Cables have also joined up the most remote parts of the world during the past year. Block Island has been connected with the Massachu-

setts coast. A cable laid in November last, from the Island of Grand Menan, in the Bay of Fundy, has afforded the inhabitants of that region their first telegraphic communication with the outside world. Cables have been laid during the year across Cook's Straits, New Zealand; from Manila to Hong Kong; along a great part of the western coast of South America; and cables now connect all parts of Australia and New Zealand with Java, Singapore, Malacca, Penang and, of course, the rest of the world. Several cables have also been laid in the Baltic Sea.

Several new Atlantic cables have been projected—two, at least, of which will be laid and controlled by American capitalists. Hitherto Atlantic cables have been exclusively Old World affairs. They will probably be laid from Penzance, England, to Whitehead, Nova Scotia, touching at Sable Island. Another one—the "European, American and Canadian Cable"—has been planned in Canada. A cable from the European continent to Iceland has also been talked of; the Mexican Government has approved a contract for a cable across the Gulf of Mexico, connecting Mexico with the United States; and it is hoped that, during this month, Mr. Cyrus W. Field (who eats his New Year's dinner to-day in Hong Kong) will materially advance the prospects of a Pacific cable from California to China, via the Hawaiian Islands.

Mishaps to the cables have been remarkably few during the past year, although the Anglo-American is reported to have suffered twice. Its 1873 cable broke off the Irish coast in April, but was speedily repaired, competition then being at its height. In November last its Brest cable was reported broken 230 miles from Brest. Stormy weather prevents its repair at present. In view of the Anglo-American having recently raised its tariff, and the French Government objecting to the rise on this particular cable (a right obtained by virtue of certain landing concessions) the "break" was, to say the least, an agreeable one for the company, since it has two other cables on which to do business at the higher tariff. The New French Cable was broken during the month of May, between St. Pierre and Brest.

The Chilians, in prosecuting their unrelenting warfare against Peru and Bolivia, have introduced some knotty questions for international lawyers to wrangle over, by resorting to the uncivilized expedient of cutting international telegraph cables. They have cut the submarine cables laid by the West Coast of America Telegraph Company, and the subject has been already brought to the notice of the British Parliament. This may, however, result in the adoption of the suggestions of Sir Travers Twiss, regarding an international treaty protecting telegraph cables in time of war.

The proposed scheme for a cable from New York to Holland, France and Portugal, via the Azores and Land's End, in England, does not seem to be flourishing. The deposit of \$100,000 required by the Portuguese government was not made at Lisbon within the required period, but the time was extended until December.

#### THE TELEGRAPH ABROAD.

The telegraph has been greatly extended abroad, England being far behind Germany and France in this respect. The United Kingdom has now 3,924 offices and 1,407 railway stations open for telegraphic work, making, in all, 5,331 telegraph offices. The total number of telegraphists employed is 5,611, of whom 1,556 are women. Their work has increased 20 per cent. during the past fiscal year. The Central Station in London now employs a staff of about 1,450, of whom 500 are girls. The needle instrument has been gradually superseded by the Morse, and is now worked only in connection with small offices. Duplex working has become quite common, and the quadruplex is no longer a novelty there. The Automatic system is still extensively used, and transmits business at the rate of 200 words a minute. In addition to the land lines, 707 miles of submarine cable connect different parts of the United Kingdom. The pneumatic tube system has also been largely extended there, in place of our "pony," or city wires. The central office in London collects messages in this manner from twenty principal branch offices, the little box bringing its bundle of messages from Charing Cross in four minutes, and from the House of Commons in seven minutes. The same system has been introduced extensively in Liverpool, Manchester, Birmingham, Newcastle, Glasgow

and Dublin, making the total length of pneumatic tubing used by the Post Office Department nearly 28 miles.

France and Germany have both improved their telegraphic systems wonderfully, although we hear less from them than from England. The last report from Germany showed that there were then 1,471 telephones in use there.

In Cyprus, lately acquired by the Jingo, the people have taken very kindly to the telegraph, which has led "Her Majesty's High Commissioner" to report that, contrary to his expectations, "the telegraph is being used by the public far more than I thought it would be."

The quadruplex has been introduced into Australia during the past year; and the Post Office and Telegraph Departments of Queensland have been amalgamated.

Tasmania, by the last reports (for 1879), possessed 731 miles of line and 62 offices, while 79 persons were employed during the year in transmitting 88,832 messages.

India, with 18,000 miles of line (44,000 miles of wire) and 108 miles of cable, sent 1,400,000 paid messages during the year.

Mexico has slightly increased her telegraphic facilities, and has now 10,000 miles of line.

The Hawaiian Islands, Alaska and China are all using the telephone.

By the construction of land lines, during last year, Cabul, Afghanistan, Eastern Siberia, Persia in Asia, and Cape Town, and the Transvaal in Africa, have been connected with the outside world.

#### The Electric Club's Christmas Dinner.

In accordance with the rule of all high-toned organizations, the Electric Club sat down to a grand dinner at Relay Hall, in this city, on Christmas Day.

Mr. John Lenhart was not present.

Old Dad Skoule, wrapped in impenetrable dignity, presided, with Mr. Manager Sniffle on his right hand, Press Operator Saltem on his left, and Superintendent Skinner at the opposite side of the table. Letters of regret were read from President Hayes and others. A true telegraphic spirit of Christmas conviviality pervaded the gathering, notwithstanding the absence of Mr. Lenhart, and mistletoe, ivy and holly were not more plentiful than the steaming boar's head, the general good cheer and the overflowing wassail bowl.

One of the great features of the evening was the evident rivalry existing between Superintendent Skinner and the venerable president of the festive board, Old Dad Skoule. The superintendent, being disappointed in not having been called upon to preside, had evidently got it into his head that "Old Dad" was his hereditary foe, and the source of all evil. Thus, when Chief Operator Brown sang, "O, Why did She Flatter my Boyish Pride?" and Old Dad Skoule leaned back in his chair in delight and put his thumbs in the arm-holes of his vest, Superintendent Skinner also leaned back in his chair, put his thumbs in the arm-holes of his vest and shot defiant glances across the table at the venerable president. Again, when Night Chief Squeele sang, "The Spring is like a Young Maid That Does not Know her Mind," with thrilling effect, and Old Dad Skoule in his enthusiasm stood up with his hands under his coat-tails, listening intently, Superintendent Skinner stood up also with his hands under his coat-tails, looking proud defiance at the venerable presiding officer. But when All-night-man Fawn feelingly sang "Kathleen Mavourneen," and the weird notes of a cornopion in a subdued tone accompanied the line, "The horn of the hunter is heard o'er the hill," Old Dad Skoule stood up and actually screamed with delight. It was then, for the first time, that Superintendent Skinner arose in his might and attempted to climb over the table with a

vain but bloodthirsty notion of laying violent hands upon Old Dad Skoule. He was restrained by the company at large.

Another novelty was the vocal music as performed at 10:30 P. M., and the vocal music as travestied at 4:30 A. M., as the following beautiful specimen will show :

SONG BY MANAGER SNIFFLE AT 10:30 P. M.

'Tis the last rose of Summer  
Left blooming alone;  
All her lovely companions  
Are faded and gone;  
No flower of her kindred,  
No rosebud is nigh,  
To reflect back her blushes  
Or give sigh for sigh.

The banqueting telegraphers were moved to tears as the splendid basso rolled out the words, "Blooming alone;" and, when the clarion notes of a trumpet, played by Brother Muddle, accompanied the rising voice of the singer, in the line, "No flower of her kindred," and the trombone chimed in on the line, "To reflect back her blushes," the spirit of the most hardened telegrapher sank within him. At this solemn moment, Superintendent Skinner, who had been glaring wildly across the table, arose in his might and attempted to climb over the table, with a vain but bloodthirsty notion of laying violent hands upon Old Dad Skoule. He was restrained by the company at large.

After ablespeeches from Press Operator Saltem, Traffic Chief John Muddle, Assistant Wire Chief Charles Grumm, Old Man Kavanaugh, and Operator Crape, who works the private wire at an undertakers, the vocal music was recommenced and marked, as we said before, a wonderful comparison with the vocal music of the early evening.

SONG BY MANAGER SNIFFLE AT 4:30 A. M.

Tisselash oesher shumner  
Lef' bloom-loan;  
Aller luv' panjuns  
Fay fay-jun gone;  
Naw flower kinjub  
Naw rosh-bud ish ni-i-i  
(Higher and higher until lost in wild ecstasy)  
To reflush (louder) backer freckles  
Or (very loud) give shy for shy.

Tremendous cheering, during which four men, including Superintendent Skinner, were overcome with emotion, and fell under the table.

The company then broke up amid much hilarity, while the band played the Racket Galop. There was a perfect jam in the vestibule, going out, while Superintendent Skinner, still in a homicidal frame of mind, endeavored to reach over the heads of the departing guests, with a vain but bloodthirsty notion of laying violent hands on Old Dad Skoule. He was restrained by the company at large.

All this teaches us that, in telegraphy as well as in everything else, it takes all kind of people to make a world.

#### The British Government vs. The Telephone.

In London, Dec. 20, judgment was declared in the case brought in the Exchequer Division by the Attorney-General vs. the Edison Telephone Company, to compel the defendants to take out a license to use the telephone, on the ground that it is an infringement of the Government monopoly in regard to telegraphs. The Court declared the defendants liable for infringing the privileges of the Postmaster-General, and accordingly rendered judgment for the Crown, with costs.

This case has grown out of the introduction of the telephone into England, and the curious phraseology of the act under which the Crown

acquired all the rights of private telegraph companies, and which defined the term "telegraph" as including any "apparatus" for the "transmission" of messages or other "communications by means of electric signals." Under this act the British Government, some time ago, purchased the several telegraph lines in the United Kingdom, paying therefor the sum of \$50,000,000 and thereby establishing a monopoly of the business of sending telegraphic messages. Soon after the invention of the telephone the Edison Telephone Company was formed in England and was beginning the work of furnishing the people there with the facilities which are so familiar here, when it was arrested by a suit brought by the Attorney-General to compel it to take out a license for the use of its instruments. The ground of the proceeding was that the telephone was an infringement of the monopoly which the government had secured in the telegraph business, and that therefore it could not be used without the consent of the government.

The arguments lasted five days and were participated in by Attorney-General Sir Henry James and Solicitor-General Kay for the Crown, and by Mr. Judah P. Benjamin, Q. C., and Mr. Webster, Q. C., for the telephone company, the last-named counsel having been especially retained because of his well-known aptitude in dealing with cases which involve scientific discussions and comparisons. During the arguments the judges had telephonic transmitters in front of them, and themselves participated in experiments which were made at the suggestion of both sides. The upshot, as we have before stated, was a verdict in favor of the government.

After the decision, Mr. Webster, counsel for the defendants, asked that judgment be stayed pending an appeal. It was eventually arranged that the order of the Court should contain terms allowing the telephone company to continue its operations.

The General Post-office has since issued a notice stating that it is prepared to establish in any town telephonic intercommunication, at the same time holding itself ready to make arrangements for the establishment or continuance of systems of intercommunication introduced by existing private companies. In answer to this notice the Telephone Company advertises that it has exclusive patent rights, and will proceed against the Postmaster-General for any infringement of those rights.

There is another case pending against the Bell Telephone Company, both cases having been instituted before the amalgamation of the two companies.

#### A Chief Operator Nominated by his Associates.

To the Editor of The Operator:

SIR: In your last issue you noticed that Manager Dealy, of the American Union, New York, had inaugurated a plan of allowing a number of his operators to take charge of the office on Sunday, thus giving them an opportunity to acquire practical knowledge that would fit them to become chief operators. Mr. Dealy has gone a step further, by allowing the operators the privilege of electing their own associate chief operator.

On the 22d inst., Mr. Dealy sent a letter to Chief Baker, saying he wished to commemorate the first anniversary of the opening of the office (Jan. 26) by allowing the operators to name one of their number to be appointed assistant chief operator.

He (Mr. Dealy) would like their choice to be one of the operators that was in the office when it was first opened. If after a month's trial the candidate should prove competent to fill the position, Mr. Dealy would confirm his appointment and add ten dollars a month to his salary. This letter created considerable excitement, and a quiet canvass was immediately opened. Within an hour the contest had settled down to two candidates, Con Myers and George Stainton. Mr. Myers has been acting as traffic chief and general utility man in the office. This gave him an advantage to start with. He is well liked, and were it not for the popularity of Mr. Stainton, he would have received a unanimous vote.

Mr. Stainton is still young, but one of the best

operators in the office. He came from the A. & P., when Mr. Dealy left that company to take charge of the American Union. He is a general favorite in the office, especially with the younger operators, among whom he had his warmest supporters in the election. Mr. Myers, however, was declared elected by a small majority. Much regret was expressed because both gentlemen could not be promoted, and some of the operators gave notice that they would not vote, because they could not decide between the two candidates.

Certainly the profession owe a debt of gratitude to W. J. Dealy for his efforts to befriend operators, and it is to be earnestly hoped that other managers will be as public spirited as he, by throwing open the positions of wire chief to the force under their charge. May Mr. Dealy be spared to many years of health and happiness!

NEW YORK, Dec. 24, 1880.

A. U.

#### Canadian Items.

To the Editor of The Operator:

SIR: The present early session of the Dominion Parliament, which is now drawing to an adjournment for the holidays, has made things pretty lively in the larger Canadian cities for the past few weeks. Exciting debates for and against the proposed scheme for the completion of our railway and telegraph service to the Pacific Coast have furnished plenty of work. Popular excitement has been raised to a very high pitch, and, as meetings are to be held throughout the country for the discussion of this question, it is more than likely that an usually quiet season will find newspaper centers, at least, crowded with business.

The M. T. Co.'s Ottawa "House" office has been handed over to the care of Mr. O. Higman, the main office chief. With an efficient staff, comprising Messrs. Bowers, Gallagher, Grimes, Alexander, McWilliams and Baker, many a hard night's work is done that would make a very favorable showing. The Ottawa main office staff consists of Messrs. McTaggart, St. Jacques, Vanluven, Lynch, Rochon, Venn and Ahearn, and the Misses Baldwin and Morgan. The whole are under the management of Mr. N. W. Bethune, an old and faithful servant of the company, who is also superintendent of the Ottawa district.

The President's late message reached here in good form, and was received on one wire by Messrs. Berry, Perrin and Joe Hurley without a break being recorded against the office. When it is mentioned that the bulk of the sending was performed by Mr. Geo. Burnet, of our Buffalo office, whose reputation for fast work is well established, the showing is all the more creditable to the gentlemen who handled it here.

Mr. W. L. Cullen, of the Chicago W. U. force, is spending the holidays with his relatives in this city. His many friends are pleased to see him looking so well. As he is one of the Canadian operators in Chicago who was not bulldozed into forswearing his allegiance to Her Britannic Majesty in the excitement of the late election, his fellow-citizens here will, no doubt, acknowledge his fealty by a suitable testimonial. Miss Fannie McConnell has gone home for a few months' needed rest. Mr. McGill, late of the Dominion office here, has been assigned a position on the day force.

TORONTO.

#### Very Pretty, Readable and Useful.

A very pretty, readable and useful book, bearing the title of "Telegraphic Tales and Telegraphic History," has just been issued by the publishing house of W. J. Johnston, of this city. With telegraphers especially, the book promises to become exceedingly popular, as it contains well-written sketches of many of those humorous and pathetic incidents which paint the sunshine of the operator's life. The general public will find much in "Tales and History" to acquaint them with the inside life of manipulators of the mystic key. It is full of instruction, neatly gotten up, and takes rank with the best of the many Christmas publications already announced.—N. Y. Express.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, JANUARY 1, 1881.

Americans visiting Europe will find THE OPERATOR on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### THE COMPLETION OF ANOTHER LUSTRUM.

Five years ago to-day the Western Union Telegraph Company put into force that well-remembered "General Order No. 164," reducing the salaries of its employes. Forgetting that they were inviting their men to a game at which two sides could play, and in spite of the murmurs of discontent, they enacted that ineffably ridiculous burlesque on true economy—the "Sliding Scale"—and thereby forfeited the confidence of men who, full of loyalty for the old concern, had been true to them alike in victory and defeat. There was no apparent excuse for such a reduction. The company was then making large profits, paying a dividend of about ten per cent. per annum, and just entering on the great Centennial year, when business was expected to be usually brisk. No explanation was offered, beyond the simple desire to "reduce expenses" at all hazards. Among all the hardships caused by the cruelly unfair order, we know of one case where, on that dismal New Year's day, a father went home to his wife and dying child—a little girl—bearing his meagre earnings, minus the amount deducted by the sliding scale. The little one overheard the sad story. Soon afterward her feverish lips lisped, "too bad," and she fell asleep—the sleep of death. The four large tears that fell on baby's inanimate form from that father's eyes scored the four dollars snatched from his slender salary—four dollars saved to the company. The triumph in financiering was not unique though, for Death had run the Western Union a close race in the matter of "reducing expenses" in that family.

It is not specially to recount the wrongs of five years ago that we refer to them now, but to show in greater relief the extent of our present prosperity. It was a beautiful custom among the Romans to celebrate, every five years, upon the completion of their census, a Lustration or Purification of the whole Roman people, in which the history of the preceding five years—or lustrum—was reviewed. Oxen, swine and sheep were offered on the Campus Martius; the warrior refought his battles; vestal and priest sang the pæan and dirge, and sighing swains piped their songs of love to blushing maidens. So do we, to point a moral, on this prosperous New Year's day, with charity toward all, look back through the hurry and bustle of the lustrum just completed. It is certainly not too much to say that the first of January, 1876—the date of General Order 164—was the day which first revealed the

crumbling in the foundation of Western Union. When that uncalled-for and cruelly unfair order was promulgated, like the revocation of the edict of Nantes, it drove away many of the company's most faithful and practical men to seek, like the Huguenots of old, a Veii in the wilderness of other professions, where there would be more profit, or at least more fair play. Men who had embarked their whole talent in the business—men who up to that time had been straining nerve and sinew, like race-horses—suddenly drew up with a round turn and prepared, in more ways than one, to resent the attempt to vagabondize them. That great trial brought out the latent strength of their characters; for the sliding scale had necessarily left them the most important part of their stock in trade—Hope and Industry. The old story anent the best laid schemes of mice and men was repeated; those who possessed the hen that laid the golden eggs killed her to get more, and lost all. The apparent prosperity of a great monopoly tempted new rivals to the field; the great *doyen* of the telegraph died—the buried grandeur of William Orton will never be resurrected—and when the pinch came, those who had trusted and served and been deceived, went over, of course, to the enemy's camp.

Fortune has since smiled upon us. To-day we are better off than ever; and so, with all the devotional earnestness and vigor of Olympian idolatry unabated, we celebrate another lustrum.

To the end that no one may be misrepresented, we devote considerable space to-day to the use of a French admirer of the postal telegraph, to enable him to explain as well as he can the faith that is in him. While extending to our Gallic critic assurances of our distinguished consideration, we advise him to continue taking it out in talk, and by no means to stake any of his *louis d'ors* on the adoption of the postal telegraph in America, unless he can get hold of the short end of a tempting bet—say, a couple of million to a dollar. The whole history of THE OPERATOR—from the moment when, as a speck on the telegraphic horizon its enemies tried to crush it by discharging its editor, down to the present time when it spans the telegraphic heavens like a rainbow, shining for all, is bound up in the working operators, and is too well known to call for an answer as to what interest it supports. Recognizing, however, the Frenchman's zeal for the welfare of the profession as being fully equal to our own, and differing only in method, we commend to him a French proverb—and since he cannot "speak well the English," we render it in his mother tongue—in which he will doubtless recognize more readily the genius of his talented countryman Le Brun. It teaches us that, "*Quand on a même but rarement on s'accorde.*" Thus, while we have the same object in view—the welfare of operators, first, last and all the time—we do not expect to agree with all those who have the same aim. Our correspondent is scarcely correct in speaking of the opinions expressed in THE OPERATOR as *our own*. We have no opinions to thrust upon others. We aim, not to lead, but to *reflect* the prevailing sentiment of the mass of our profession; and, in antagonizing a postal telegraph scheme—so long as the present alleged civil service, political tenure of office system and the periodical "election assessments" on the slender salaries of government employes prevail—we know that we are expressing the opinions of a majority of the thoughtful men now employed under the various

companies. If our knowledge-seeking French correspondent wants to know particularly what "a gang of pot-house politicians" is, we respectfully refer him to the well-known cipher-alleys and lightning-calculating bureaus, to be found anywhere he may seek them.

The decision of the Telegraphers' Mutual Benefit Association may have been just right—it was, at all events, the even pound of flesh—to refuse the claim of the widow of the late John G. Boyce, and to thrust her aside while she appealed in trembling anticipation, with her dead husband prostrate by her side. It may have been just, but a man must be as cold-blooded as a fish to deal out "justice" of that kind. The woman's health—if it is not too overwhelmingly sarcastic to call it "health"—is gradually failing under sorrow and bitter disappointment, and we hope that the members of the T. M. B. A. will pay, voluntarily, the claim which has been rejected by a bare majority of their executive committee. If the concern expects to create confidence among telegraphers, it must not, after accepting a risk through its accredited agent, and taking in a duly certified member's regular assessments for 15 months, dispute the matter with the widow and orphan after the strong arm which gave them bread has been swept away. Somebody saved a dollar (his individual assessment) by putting forth a letter showing that Boyce was not in prime condition when he joined the association; all the other members saved a dollar by the action of five out of nine of their executive committee in rejecting the widow's claim, and the decision was apparently indorsed by the operators at large because it was never properly presented to them—a defect which we propose to remedy in due time, now that we have commenced it. We firmly believe that, in a doubtful case, the big heart of the average operator would forbid him to be party to a harsh decision against the memory, and, still more so, against the dependent ones of his dead fellow-laborer. It is better that we should expend a dollar apiece in paying a seemingly bad claim, once in ten years, than that, as in this case, a friendless woman on the verge of her confinement, with an infant still in her arms, should be cast adrift without a penny, and a thousand miles from home or friend.

We regard the decision in the English telephone suit as a correct one technically, reasonable under the circumstances and eminently sound in law. We are unable to see how the Telephone Company, in taking an appeal, can expect the highest court in Great Britain to reverse the decision of the Court of Exchequer. If we ever establish a postal telegraph system here, a similar ruling would soon be necessary to protect it, since some ingenious Yankee would promptly invent a method of transmitting intelligence by means different from those known at the time of the acquisition of the existing telegraphs.

A monopoly can afford to have no quibbling about the word "telegraphs." It must cover all methods of communication or none. Batteries or no batteries, wires or no wires, magnets or no magnets, an intended monopoly *must* adopt the meaning of the word "telegraph" as given by Sir William Thomson, viz.: "The interchange of ideas between two intelligent beings by means of inanimate matter occupying space between them."

If England shall now permit the telephone people to take in, transmit and deliver messages, by means of the telephone, that action would

result in competition fatal, or excessively damaging, to the Government's monopoly, a little whistle for which it paid fifty million dollars.

But the whole business strikes the average free American intellect as the necessary outcome of a Government monopoly. It means that a monopoly must, in its own defense, prevent improvements; that it must immediately confiscate any valuable invention; that inventions must be discountenanced, even if not declared contraband, and that, as in the case of the telephone, when America sends them a good thing it must be put where it will do the least good. All this proves that a Government monopoly can never give to the public the advantages furnished by private enterprise, acting under the spur of two or three lively competitors.

SENATOR MORRILL'S resolution instructing the Committee on Post Offices and Roads to inquire whether or not the telegraphic service of the country should be brought under the control of the Government must be in the nature of a hard task for the committee. The corresponding committee of the House has been struggling with a somewhat similar bill since May last. We hope that both committees will delve down deep into the subject, and give us some reliable account of how much the British public—who for twelve out of every twenty-four hours are telegraphically nearer to New York and Chicago than to any of their own neighboring towns—paid for their new telegraphic whistle, and how they like it. We have also a brotherly word for any possible outside promoter of this scheme. If there be such a man, cherishing the fond hope of a fat job for himself for a term of years out of such a politico-commercial monopoly, we would advise him quietly to exact real-estate security for the payment of his salary after the first election has introduced the "spoils of victory" doctrine into his new scheme.

THIS is the day when all the boys "swear off." Very well; swear off anticipating wealth from any source other than hard and steady work; swear off trying to hoist more sail than you can carry with safety; swear off telling your secrets, even to "bosom friends;" swear off spending all your leisure time in seeking pleasure, and swear off being over-cautious or too backward. If you are possessed of any particular talent, don't hide it under the traditional bushel; be around always when the prizes are being given out; study hard, live within your income; never borrow, make your word as good as your bond; aim to be always five minutes ahead of time; attend to your employer's business as though it were your own personal affair; read THE OPERATOR attentively during the coming year, and profit by what you learn from it; cut this paragraph out and paste it in your hat, and then take notice, this day next year, how little you have to "swear off."

WE suggest to American scientists, in view of the forthcoming exhibition of electricity in Paris, that arrangements be made for a similar exhibition in this country, at an early day, subsequent to the Paris exhibition. America has, long ago, taken the lead in electrical research and invention, and such an exhibition in this city, the metropolis where Morse lived and died, or in Philadelphia, the home and final resting place of the immortal Ben Franklin, would be peculiarly appropriate, and, we believe, profitable. The quadruplex, the telephone, the phonograph, the microphone and the photophone have all been invented, or have come into use, since the Centen-

nial Exhibition, only four years ago, and, with the wonderful possibilities of even the next twelve months, we might say that such an exhibition in America would be not only a patriotic expedient, but an absolute necessity for the proper appreciation of the progress of electrical science.

EVER since the introduction of the telegraph, men have been writing voluminously on electrical subjects, but their efforts have been rather too deep for the ordinary student. The "Notes and Queries" of Mr. T. D. Lockwood, which are now enriching the columns of THE OPERATOR, are written with a special desire to avoid that great stumbling block to the study of electrical science. Mr. Lockwood has stored his own mind with all that it is necessary to know on this subject, and has discovered the secret of imparting his knowledge to others in a way that is proving to be very popular. He can reason from cause to effect, and has breadth of mind, not only to disentangle a lot of knotty questions, but also to present them straight and smooth to his readers. Every operator should read those articles carefully, and seize the opportunity of learning, in an easy way, the most intricate questions connected with our profession.

THE 8th inst. in addition to being the sixty-fifth anniversary of a memorable national victory—the Battle of New Orleans—is also a reminder of the vast importance of the services now rendered to mankind by the electric telegraph. When that great battle was fought the treaty of peace between the United States and England had been signed for two weeks. But there was no ocean cable in December, 1814, to waft the peaceful tidings from Ghent, and so avert a furious battle on our soil in January, 1815. Had there been a telegraph in those days, the hundreds of lives—including that of the gallant Pakenham—which were uselessly sacrificed in the cypress swamps of Louisiana, would have been saved.

THE days of telegraph poles and over-head wires in large cities seem to be rapidly drawing to a close. In New York and Philadelphia, and also some other large cities, great preparations are being made for the laying of underground lines. There was an idea dropped by "S. A.," in the last number of this paper, in connection with this subject, which is worthy of consideration, viz., to establish the main office *outside* of the city limits, and transmit telegrams to and from branch offices in the city by pneumatic tubes; all the relaying to be done at the main office in the suburbs.

THE extreme length of our very full synopsis of telegraphic doings during 1880 will remove any necessity for calling attention to it. It is a most gratifying exhibit of the affairs of the whole telegraphic world, and places America well to the fore in all that pertains to electrical science and progress. We now look forward to another year of activity and prosperity. The most important events already planned for 1881 are the laying of two or more new Atlantic cables and the International Exhibition of Electrical Appliances, to be opened in Paris on the 1st of October, and to remain open until November 15th.

AMONG other good resolutions formed to-day, it would be a prudent thing to resolve to join the Telegraphers' Mutual Benefit Association. The dispute raised in the case of John G. Boyce, after a membership of fifteen consecutive months, is certainly a discouraging precedent; but we believe that, all things considered, the T. M. B. A.

is safer and cheaper than any of the regular insurance companies.

THIS day commences the year 1881, during which, according to the prophecy of Mother Shipton, made some hundreds of years ago, the world is to come to an end. Carriages are now running "without horses;" England has accepted a Jew, and all the other predictions have been fulfilled, save only the couplet which says:

"The world to an end shall come,  
In eighteen hundred and eighty-one."

Still, plans for electric lighting, and the extension of the telegraph by sea and land are being pushed rapidly forward.

Mr. A. F. Hurd, manager of the A. U. office at Buskirk, N. Y., devotes his spare time to printing visiting cards for operators. This is very commendable, and it is hoped that his brother operators throughout the country who need visiting cards, will send him their orders. We have seen the cards, and feel certain that they will prove satisfactory to those who try them. See Mr. Hurd's advertisement in this issue.

WE commend the following to the consideration of the slim array of advocates of an American postal telegraph system. The London Times, in commenting on the decision in the telephone suit, says: "If telephonic communication be suffered to fall under the control of the General Post Office, it will not only be enhanced in cost, but will languish as a scientific discovery."

THE privilege of subscribing to the stock of the proposed two new Atlantic cables expired yesterday, and it is now morally certain that in the course of the next six or seven months the American Union will be working both of them between Penzance and Torbay. The Siemens Brothers have already commenced the work of preparation for their manufacture.

WE are pleased to hear that the American Union Company is disposed to let its rates remain as at present, thus avoiding for the nonce any chance of a war of rates, and contenting itself with the spectacle of the Western Union coming down from its lofty perch to compete for business without the aid of a dummy company.

IT may be a good thing for our fair sisters who admire the electric light to know that under its mild beams the skin will soon show all the symptoms of "sunburn," even in midwinter. Our philosophers now state that the electric light will develop freckles in winter as quickly as the sun will in midsummer.

TO-DAY Mr. Cyrus W. Field eats his New Year's dinner in Hong Kong, China. The telegraphers of America wish Mr. Field many returns of the season, and more so since his presence in China is likely to open a new field for telegraphers, both on land lines and cables.

A MATCH is a small article, but match-making is a vast industry; and it appears as though the electric light is going to ruin it, by practically doing away with the use of matches.

WESTERN UNION stock is quoted at 78½, American Union at 71¼, and A. & P. at 34. Last issue they were 82½, 71¾ and 34, respectively.

SINCE our last issue, General William B. Hazen has been confirmed by the Senate as Chief Signal Officer of the Army.

THE OPERATOR wishes you all a very Happy New Year.

## Notes and Queries on Electricity and Electro-Magnetism and their Applications.

Practical as far as possible ;  
Theoretical as far as necessary.

BY T. D. LOCKWOOD.

Q. 74. What is a galvanometer ?

A. A galvanometer is an instrument for detecting, indicating, or measuring currents of electricity.

When used only for detecting and indicating such currents, the instrument is more properly called a galvanoscope. Galvanometers are made in many forms, and are used in several different ways, but are all based on the fundamental fact that a magnetic needle is deflected from its natural position by the passage of a current of electricity in a conductor placed parallel to it. When the conductor is carried over the needle and back on the other side the effect is doubled, and, of course, if we repeat the operation a great many times, using insulated wire, thus forming a coil in which the needle is freely suspended, the effect is multiplied almost indefinitely.

All galvanometers, then, consist of a coil of insulated wire and a magnetic needle delicately suspended, so as to be easily deflected by the passage of a current through the coil. These, with the addition of a dial plate, graduated so that we may intelligently interpret the movements of the needle, are the only essential features of the instrument.

Horizontal galvanometers are more sensitive than vertical ones and are in more general use. In using a galvanometer for any purpose, an instrument of low resistance is the fittest one to use for testing low resistances; and the greater the resistance to be tested the finer should be the wire, the greater the number of convolutions, and, consequently, the higher the resistance of the galvanometer.

Q. 75. When and by whom was the galvanometer invented ?

A. The galvanometer is one of the earliest results of Oersted's discovery. It was, in fact, in the same year (1820) that the first galvanometer was invented by Prof. Johann S. C. Schweigger, of Halle, who passed a number of turns of insulated wire round the compass needle, thus multiplying the galvanic effect and constructing a galvanometer.

An instrument of different form was soon afterward independently devised by Johann C. Poggendorff, of Berlin; and, as a description of this latter was published prior to that of Schweigger, Poggendorff has been thought by some to be the original inventor.

The invention of the galvanometer is the basis of the "needle" system of telegraphy.

Q. 76. What are the principal galvanometers now in use ?

A. The tangent and sine galvanometers, the differential, Thomson's reflecting galvanometer, and those constructed on the Wheatstone Bridge principle, which latter usually comprise also the necessary resistance coils.

Q. 77. What are the principal uses of a galvanometer ?

A. Besides the use implied by the name—i. e. that of detecting and measuring galvanic currents—the galvanometer is invaluable in practical telegraphy, and is employed in the testing and measurement of instruments and circuits for conductivity resistance; and the latter also for insulation resistance. It is also used in the localization of faults on telegraph lines and in cables; in the measurement of internal resistance, and estimation of the electromotive force of batteries; and, in the case of long submarine lines, as a receiving instrument for telegraphic signals.

Q. 78. What is an astatic galvanometer ?

A. It is a peculiar arrangement suggested by Professor Cummings in order to increase the sensibility of the galvanometer.

Two needles are freely suspended on the same axis, parallel to each other, but with their poles placed in contrary directions—the north pole of the upper arc being directly over the south pole of the lower one.

The sensibility of the galvanometer is increased, because the directive force of the earth

is neutralized, since the two needles are opposed to each other. If the needles could be made exactly equal to each other in magnetic power, they would stand indifferently in any position in which they were placed; but, in practice, one needle is always a little stronger than the other, and the pair will, therefore, settle in a north and south direction.

Each needle may have its own coil, the coils being joined so that the current circulates in opposite directions around the two and deflects both needles similarly.

On the same axis with the needles, but above the graduated circle, is a pointer to denote the deflections. The nearer the two needles are to each other, in magnetic strength, the slower will be the vibrations of the pair and the greater the delicacy of the galvanometer.

Two needles so mounted and arranged in coils constitute an astatic galvanometer.

Q. 79. What is a tangent galvanometer, and how is it used ?

A. It is an instrument invented by M. Pouillet, a French electrician. Its principle is that, "The strength of current, as measured by the tangent galvanometer, is proportional to the tangent of the angle of deflection of the needle." It is thought by many electricians to be the most useful and convenient form of galvanometer for general purposes. It consists essentially of coils of wire wound in a deep groove in the circumference of a brass ring, about six inches in diameter, with a small magnetized needle hung at its center, and moving over a graduated circle. The length of the needle must be small compared with the diameter of the coil, in order that the influence of the coil may, as far as possible, be the same at whatever angle to which the needle may be deflected.

A form of this instrument is made in the United States, with the above object specially in view. It was devised by Dr. Bradley, of Jersey City, and is described as follows :

"The needle is composed of several parallel strips of steel, mounted on a ring of aluminium, and trimmed to form a circle.

"By this means, all parts of the needle are subjected to the influence of the coil throughout the entire deflection. Four coils are used, the first about 150 ohms resistance, the second 25 to 30 ohms, the third one or two ohms, and the fourth is a strip of sheet copper, or brass, which is wound two or three times around the needle."

The first coil is used for high resistances, the last for very low resistances, and the other two for medium resistances.

It will do no harm to state here, for the benefit of the student who is no mathematician, that a tangent is a straight line which touches at any one point the circumference of a given circle.

In the case of the tangent galvanometer, the dial of the instrument is the given circle, and the point at which the tangent touches the circle must be the zero point.

The tangent is, therefore, an imaginary line, which must be parallel to the diameter that connects the degree of ninety on one side to the same degree on the other side, and at right angles to the diameter, or line connecting the two zero points. Now, if the needle is deflected by a given current to twenty degrees, a current of double the strength will not deflect the needle a second twenty degrees, but to double the distance measured off on the tangent line.

This instrument is very useful in testing overhead lines, in measuring resistances by substitution of a known for an unknown resistance. It is much used in England, as an instrument for making periodical line tests, and is employed for almost every general purpose in this country. A modification of the tangent galvanometer was constructed by Mr. Gaugain, by suspending the magnet eccentrically at a point in the axis of the coil, distant from the center by half the radius of the coil. It is, however, proved by Clerk Maxwell, that this modification is in reality the reverse of an improvement. The instrument was really improved by Helmholtz, who placed two equal, parallel and vertical coils, one on each side of the needle, each at a distance from it equal to half the common radius. The proper deflection to work with is from 30 to 50 degrees. If a less deflection is used, a small error in reading off makes a large one when worked out; and, if a larger deflection than 50 degrees is used, a large alteration in resistance will produce but little effect on a galvanometer.

Care must be taken, using this instrument, to have the scale in proper position, so that the ends of the pointer stands over the zero points. If the deflection be too low when testing, try one of the other coils, until a proper deflection is found; always taking care to use the coil which most nearly approximates the resistance to be measured.

If one coil gives too high a deflection and the next one too low, vary the battery power. This instrument is generally used with a table of tangents, so that when the needle is deflected to any degree and the result is read off, the tangent of that degree may be ascertained by reference to the table.

Q. 80. What is a sine galvanometer, and how is it used ?

A. A sine galvanometer is one in which the coils are made movable, so as to be capable of revolving on the axis around which the needle turns. A scale graduated with degrees is attached to the coil, so that the angle, through which it is turned can be observed. When the needle is deflected by a current passing through the coil, the coils are turned by hand, following the needle in its deflection; as the coils are turned, the needle diverges still more, but the angle it makes with the coils becomes less and less, until, at length, a point is attained at which the needle remains parallel with the coil.

When this point is reached, the influence of the earth's magnetism exactly balances the deflective force of the current.

The strength of the current that produces the deflection will then be directly proportional to the sine of the angle through which the coil is turned.

The sine of any number of degrees is that part of the diameter of a circle which is included between a line drawn from its center to the zero point of the graduation circle, and another line parallel to the first, cutting the circle at the degree whose sine is required. If a current of known strength then deflects the needle to an angle of thirty degrees, and the current to be compared deflects the needle to an angle of forty-five degrees, the strength of the second current is to the first as the sine of forty-five degrees is to the sine of thirty degrees. The usual practice is to read off the degree and refer to a table of sines for the required sine. In using the sine galvanometer it is necessary to be careful that, if the needle is at zero at starting, it is brought back exactly to zero again. It is a very accurate instrument if properly managed, and is used chiefly for measuring and comparing weak currents.

Q. 81. What is a differential galvanometer, and how is it used ?

A. It is an instrument invented by M. Becquerel. The needle is poised or suspended like that of the sine and tangent galvanometers, but is surrounded by a coil composed of two wires of equal length, size, and conductivity.

The ends of these coils are so connected that a current made to traverse them passes through the two coils in opposite directions, and, therefore, when the current in each coil is equal, the effect of one coil is completely neutralized by that of the other, and the needle is not deflected. If, now, one current be made stronger than the other, the balance will be destroyed and the needle will be moved by the stronger current.

This instrument is used to measure resistances, by comparing them with standard resistance coils. The resistance to be measured is inserted in the circuit with one of the galvanometer coil wires, and the standard resistance in circuit with the other coil wire. The standard resistance is usually inserted by drawing out plugs, or, as it is technically called, "unplugging resistance." We will suppose that a telegraph line is to be measured for conductivity resistance: It is placed in circuit with one of the galvanometer coils, with the effect, of course, of greatly increasing the resistance on that side; and, in consequence, a large proportion of the current returns through the other side, where, as yet, there is only the resistance of the galvanometer coil, the needle being strongly deflected. We then "unplug resistance" from the rheostat on the opposite side to that of the resistance to be measured, until the needle is balanced; and the amount thus unplugged equals the resistance to be measured.

In order that widely differing resistances may be balanced, one coil is provided with shunts,

These, when used, vary the sensibility of the galvanometer, and, by diverting a portion of the current, permit a small resistance on one side to balance a large resistance on the other. For example, if we have a resistance to be measured, and the comparison coils at hand are not large enough to be substituted for the unknown resistance without the use of a shunt, we employ a shunt of, say, one ninety-ninth of the resistance of the galvanometer coil. The current passing through that coil will then be one-hundredth of the original current, because the ninety-nine hundredths pass through the lesser resistance of the shunt. Now, as the current passing through the coil is but one-hundredth part of the entire current, which, if unshunted, would pass through it, it follows that the resistance which must be unplugged to balance the unknown resistance will actually be but one-hundredth part of the resistance required.

After using the shunt of one ninety-ninth, then, we will suppose that, to balance the needle, we have to unplug five hundred ohms; which is, as stated above, just one hundredth part of the true unknown resistance.

All we then have to do is to multiply the five hundred by one hundred and the result is equal to the unknown resistance; that is, fifty thousand ohms.

It is particularly important that each coil should be perfectly insulated from the other; as imperfect insulation is the worst defect a galvanometer of this class can have.

Q. 82. Describe Thomson's reflecting galvanometer.

A. Thomson's reflecting galvanometer is the most sensitive instrument in use, and is almost invariably employed when very high resistances have to be measured, and also when great accuracy is required. Its principle is that of delicately suspending a very light and small magnetic needle within a coil consisting of the greatest possible number of turns of wire, and of magnifying the movements of the needle so surrounded by a beam of light, reflected from a small mirror fixed to the needle, on a graduated scale about three feet away.

As usually made it has two circular coils, one over the other, which completely surround the needles; so that, no matter what angles they are deflected to, they are always under the influence of the coils. The instrument is generally made astatic, and the two needles are connected one with the other by an aluminium wire. Its base is usually made of ebonite, and is provided with spirit levels at right angles to each other, so that the whole instrument can be set accurately level by means of leveling screws.

On the base are two brass pillars, between which are hung the coils, in a brass case, but wound on bobbins of non-conducting material. The magnetic needles are very small, usually not more than three-eighths of an inch long, and to the one in the top coil is fixed a very small mirror. The two needles and the mirror are suspended by a silk fiber to a stud, which can be raised or lowered by a screw. The beam of light before mentioned is thrown from a lamp placed behind a screen, and falls on the mirror, which is slightly inclined, so as to reflect on a graduated scale, placed immediately above the point where the beam leaves the lamp. This scale is a straight and flat surface, and is generally marked with 360 divisions on each side of the zero point.

A glass shade is placed over the coils, and from the center of its tops a brass rod rises. A short, brass tube slides on the rod, and carries a weak bar magnet, slightly curved, which is fixed at right angles to the rod.

This magnet can be slid up or down or twisted around, and the sensitiveness of the needle thereby increased or diminished.

By turning the bar magnet so that its north pole points to the north, it will act on the needle with a magnetism opposing that of the earth, and tend to turn the needles around. By sliding the bar gradually down a point is reached where the earth's magnetism is just counter-acted. When this point is arrived at the needle will stand at any position. The regulating magnet is then raised about an inch higher than the neutralizing position, when the earth's magnetism will be just sufficient to keep the needles north and south. They are, therefore, very sensitive to any external force, and move when a very weak current passes through the coils.

In using this instrument no iron must be near it, and the testing operator should remove any keys or knives from his person, as so sensitive an instrument is often affected by such things.

These instruments, when intended to measure large resistances, are often wound with German silver wire, and their own resistance is sometimes as high as fifty thousand ohms. Such an instrument will give, with one cell of Daniell's battery, a deflection of two hundred divisions when measuring an outside resistance of ten million ohms.

The reflecting galvanometer, besides being used for delicate measurements and high resistances, is much employed as a receiving instrument for telegraphic signals sent through long submarine cables. A modification known as "Thomson's Marine Galvanometer," is used on ships laying cables, as a testing instrument, and for similar purposes. It is so arranged as not to be affected by the oscillations of the vessel, the fiber carrying the needle being attached to both top and bottom of the frame in which it is suspended.

#### Government Monopoly vs. Private Enterprise.

To the Editor of The Operator :

SIR: By watching from my lodgings the pretty cottage opposite, where a gentleman had much instructed me by teaching to his little girls the game of croquet, I came by degrees to know him, and through his kindness I have for some years read regularly THE OPERATOR. I do not speak well the English, nor yet can I fluently express by that tongue what I would wish to say in writing. This I much regret, especially as I seek to quarrel with the sentiments contained on your editorial page in the number for Dec. 1. I know well the difficulties to be encountered in an attempt to refute in its own columns a journal's editorial utterances; but, as you English-speaking people put it, "a cat may look at a king."

Therefore I will not silent be.

My understanding is that THE OPERATOR is conducted in the interest of operators. Am I right? I conceive it to be no part of your policy to pander to the selfish motives of corporations. Again I ask if I am accurate? I fancy you say "yes;" and I will proceed, *s'il vous plait*.

To me, a Frenchman, whose life has been so passed as to make him *au fait* on telegraphic subjects, both in Europe and America, your points in reference to the Government telegraph project do not seem to be well taken, and your logic appears not genuine. Much that Postmaster James is reported to have said of the capacity of "a little cheap wire stretched through the air" is very amusing, and the statement that "girls and women could do most of the work at moderate salaries" is likewise very absurd. Sarah Siddons was a great actress, and Mrs. Scott-Siddons is one of her lineal descendants, but the latter is not her grandmother. So with these extracts from the Cincinnati *Enquirer*. We have no proof that Colonel James said anything of the kind. They are put forth as his views, it is true, but by whom? By that imaginative scribe "Gath." Postmaster James is ever sensible and practical. If men were rated by medical examiners by the report Gath makes of their utterances, your beautiful country would have more asylums for the victims of lunacy than it has of public buildings.

In citing events and figures when making your comparisons between telegraphy as performed in England and on this side of the Atlantic, you seem to me to be very unfair. Many important offices in the United States are closed at an hour too early for public convenience, the same as is the case in England, and I believe the tendency to close early, equip offices with inferior people and make them as insufficient as possible by grinding them down by a starvation equivalent for their services, is much greater under the administration of private corporations having large bulks of watered stock on the market, the interest on which must be paid to avert the dire dilemma of bankruptcy, than when the control of telegraphs is permanently vested in the hands of the Government.

As to the increase of lines in the United States

by private enterprise in comparison with the extensions in England under Government control, I shall hold that this is a new country to which the peoples of all nations are ever flocking. Is it not natural, I ask, that business here should increase faster than in a long-settled country, and thus make necessary the erection of more miles of new lines? Moreover, your great cities are wide apart, and the comparison for that reason is not comprehensive. As well say Texas is a more thriving state than Massachusetts because it requires eight times as many miles of wire to connect Sherman with Brownsville as it does to connect Boston with Worcester.

Let me now ask: Is not your logic artificial?

I do not understand your reference to "a gang of pot-house politicians," and my sincere inquiries have not developed any knowledge as to who constitutes this disastrous element, which is to appear in Washington as a "delegation" to urge the removal of the manager at New York. Has the Postmaster at New York, at Boston, at Baltimore, Philadelphia, Buffalo, Chicago, New Orleans, San Francisco, or elsewhere ever been injured by these potentates?

The idea is absurd.

It has been my good fortune in the United States, as it was on the Continent and in England, to meet many government officials. I suppose that Postmaster James you know. Is he not a gentleman of education and culture? Is he not a fluent speaker, a correct writer and a valuable member of the community in which he resides? If you know him at all, it is as I describe him that you have him known. The managers of the New York telegraph offices, I have not the knowledge of them personally. They may be the peers of Colonel James, but they are not his superiors. I have heard it related that some of them are men having neither education nor culture. Perchance they are not even fluent speakers, correct writers or especial ornaments to society. This also has been intimated. Let us stick a pin here.

Colonel James is one of many gentlemen appointed by the Government to fill important positions, and the "gang" of which you speak have not him disturbed. Does it not then naturally follow that the telegraph managers, would be equally free from political domination, if they were gentlemen and were capable of filling—not disgracing—the offices to which they were appointed?

My friend by whose copy of THE OPERATOR I enrich my little store of information, tells me that the telegraph superintendents and managers in some cases are selected by the corporations because of their porcine tendencies and brutish instincts. He represents that these men's tenure of office depends somewhat on the degree of meanness of which they are capable, and that their aids are occasionally selected with a special view to an absence of the milk of human kindness in their composition. He contends that but few of the hundreds of men who have won high positions outside of the telegraphic circle were ever anything while they were in it. Their good qualities, intelligence and breadth of mind, which have since led them up to ultimate success in other branches of life, created them unpopular, he says, with the telegraph managers, and that in many cases they quit the service because of the petty persecutions to which they were subjected, and on account of the hopeless outlook for men of their character and ability if they remained. He would have me believe that many operators yet in the ranks are at the mercy of a class of men incapable of generous impulses, who obtained their positions because they were sycophants and who retain them by perpetuating a system of espionage upon those beneath them, which is repugnant to all self-respecting men the world over. This, then, if my friend speaks truly, is the result of more than thirty years of telegraphic management by the private corporations!

Is it not monstrous?

If THE OPERATOR is the champion of telegraphers, let it not preach down Government telegraphy. Under ordinary conditions better men are chosen for public trusts than are selected to administer the affairs of telegraph companies. The press, powerless to influence the management of a private business, sees to it that public officers do not disgrace their country with impunity; and these officers, always under the eye of the press, choose their assistants with some

regard for their character as men. In other words, manhood is not at a discount in the Government service. It is very far below par in the eyes of private corporations, if half we hear is true. Again, Government employes possessing the requisite natural ability and the acquired accomplishments necessary to make a first-class telegrapher, are better paid, more considerately treated and are more securely entrenched in their positions than are the operators with the corporations. Let us have the Government telegraph by all means, if for no other reasons than that it removes the insurmountable wall which now confronts every operator when his salary has reached the neighborhood of \$100 per month, and because it opens to men worthier of better work an illimitable field in which they may hope for promotion according to their deserts and the measure of their capabilities, while relieving them simultaneously from the tyranny of men officially greater, but naturally inferior, who perpetuate their reign of power under the existing régime by aiding in crushing the pride and spirit out of weak men, and in driving out of the business the strong characters which admit not of being molded until they become automatons to do the disgraceful bidding of those having superior official elevation.

*Au revoir,*

VICTOR DU SAULD.

CAMBRIDGE, Mass., Dec. 12, 1880.

#### Organization of an Electrical Association at Albany, N. Y.

*To the Editor of The Operator:*

Sir: The city of Albany needed an Electrical Association. Its three telegraph companies, its two telephone exchanges, its two railroad telegraphs, its Medical college and the science departments of its three great schools—the High school, the Normal school and the Academy—presented a body of men of exactly the variety required to make such an association both a success and a necessity. For there were the men brim full of the theories of electrical phenomena, and acquainted with the mathematics of the subject, and others to whom the applications of electricity were perfectly familiar; and these men needed a common standing ground where they might interchange views, and each, out of his special knowledge, supplement that of the others. Then there were those who required instruction on all points; operators whose long business hours precluded study of principles, and amateurs whose energies required direction. These men needed the advantages of an electrical association to make good their deficiencies.

Thus the ground was prepared and the material in abundance at hand, and at length a builder appeared to put this material together and form a useful structure. This builder was Mr. Ira S. Kinch, Supt. of the N. Y. C. R.R. Telegraph. He drew up a call which was willingly signed by nearly all of the prominent telegraph and telephone men and scientists of the city, and published in the daily papers. The result was that two days later, on Wednesday evening, Dec. 15, about one hundred and fifty gentlemen met in the Common Council Chamber and proceeded to organize the Electrical Association of Albany.

The meeting was called to order by Richard Prescott, Professor of Natural Science in the High School, who, in a brief address, explained the objects of the meeting and the proposed association. Geo. S. Weaver, a prominent citizen and enthusiastic amateur electrician, was chosen chairman. A committee appointed to prepare a plan of organization and nominate officers made a report, which was adopted, electing the following officers: President, Geo. S. Weaver; 1st Vice do., James H. Rugg; Manager W. U.; 2d Vice do., Andrew B. Uline, General Manager Commercial Telephone Co.; 3d Vice do., C. H. Parr, Manager American Union; 4th Vice do., A. F. Onderdonk; Treasurer, Chas. E. Jones, M. D.; Rec. Sec., Supt. Ira S. Kinch; Cor. Sec., Jos. S. St. John, Prof. Sciences State Normal School, and an Executive Committee consisting of the President, Treasurer and Recording Secretary *ex officio*, and Wm. J. Cull, Supt. Fire Alarm Telegraph; C. H. Sewall, Manager A. & P., J. S.

Mosher, M. D.; Prof. Richard Prescott and Warren S. Dow.

A great deal of enthusiasm is manifested in the undertaking, and there is every reason to believe that a highly successful career is in store for the Albany Electrical Association. P.

ALBANY, N. Y., Dec. 25, 1880.

#### New and Interesting Stories.

“Telegraphic literature of the popular sort has nearly always been very scrappy and very dull, the same old stories being made to do service over and over again. It is gratifying, therefore, to find that Mr. Johnston, in his new book, ‘Telegraphic Tales and Telegraphic History,’ has introduced his readers to a number of new and interesting stories about operators and the public, if we cannot precisely defend the historical and scientific portions of the book from the charge of scrappiness. ‘Telegraphic Tales’ will be popular among operators, and the general reader will find a good deal of instructive and amusing matter in the book.”—*N. Y. World*.

#### The Telephone in Colorado.

*To the Editor of The Operator:*

SIR: There are throughout this State thirteen telephone exchanges, controlled by the Colorado Telephone Company, Mr. F. O. Vaille, Manager. There is also an exchange at Leadville, controlled by other parties, about which I know very little. Among our exchanges, I think, you will be able to find one or more even smaller than Ayer, Mass. We are doing a very prosperous business, and I think we have more telephone in use throughout the State, according to population, than any other State in the Union. We have trunk lines connecting Golden City, Central City, Black Hawk, Nevada, Idaho Springs, Georgetown, and Silver Plume. The latter place is about fifty-five miles from Denver. It is the longest line we have and works very well, indeed. We have undoubtedly the most difficult territory in the United States in which to work long lines, on account of the altitude and superabundance of atmospheric electricity. I understand that an experiment at telephonic communication between Denver and Leadville was once tried, but with unsatisfactory results, the induction (so called) being so great as to make communication unintelligible.

We have local systems (not connected, however, by trunk lines with Denver) at Colorado Springs and Manitou, Pueblo, Silver Cliff and Rosita. Manitou, as you are doubtless aware, is situated at the base of Pike’s Peak and in the immediate vicinity of some of the grandest scenery in the world.

It has recently been discovered by ye enterprising reporter of the *Colorado Springs Gazette*, aided by the fervid Irish imagination of Sergeant O’Keefe (in charge of the Signal Station on Pike’s Peak) that a living volcano now inhabits that unhappy mountain, and it may be that future generations will discover under a depth of lava the telephone used by General Grant on his recent visit.

The exchange at Pueblo is in a prosperous and growing condition, Pueblo being situated at the junction of the Atchison, Topeka and Santa Fe and the Denver & Rio Grande Railroads, and destined ere long to be the great distributing depot for a vast population which will soon fill the great mineral region in Southern and South-western Colorado. When the exchanges at Silver Cliff and Rosita (connected by a trunk line, seven miles long) were established early last spring, Silver Cliff was a city of shanties, but recent discoveries have given it another “boom,” and now its people are soon to be blessed with a railroad, water-works, and other modern improvements. The celebrated Bassick and Bull-Domingo mines are connected by telephone with the exchange.

The coming Spring will probably see the bold telephone man stretching his lines between the mining camps of the wonderful San Juan regions, and possibly he may seek to impress upon the mind of the benighted but warlike Ute the great advantages which may follow the leasing of a telephone.

The wonderful discoveries of mineral wealth

in this State during the past few years make it more than possible that the Colorado Telephone Company may be called upon to construct an exchange for the use of four or five hundred subscribers in some city as yet unborn. S.

DENVER, Col., Dec. 11, 1880.

#### Written in Entertaining Style.

A very entertaining book, whether for the professional or the general reader, is “Telegraphic Tales and Telegraphic History,” written and published by W. J. Johnston, editor of *THE OPERATOR*, New York. Mr. Johnston relates the whole history of the telegraph, gives a number of amusing anecdotes connected with its use, and explains its use in connection with the Signal Service, the railroad systems and other outgrowths of its usefulness. He writes in entertaining style, and never suffers the reader’s interest to flag over a dull page.—*Philadelphia Inquirer*.

#### Pacific Coast Notes.

*To the Editor of The Operator:*

SIR: Nothing startling has occurred in this portion of the telegraphic world lately. There have been a few changes made in the Division, one or two transfers of operators between small offices and a change of managers at Sacramento. Upon reflection, it occurs to us that there is something *startling* about the change last mentioned. It will be remembered that Mr. Allen (late manager at Sacramento) was the cause of getting the Western Union into quite an interesting law suit nearly two years ago, by discharging Mr. Williams, an operator, against whom he entertained a personal grudge. Mr. Williams sent a paid telegram, in protest, to Superintendent Gamble, and claimed that it was suppressed by Mr. Allen. Out of this he made a case against the company, which has been on trial two or three times in different courts, but which at present bears the appearance of having been compromised. Shortly after this occurred the retirement of Mr. Allen into the obscurity of private life was talked of by the officials and confidently expected by employes of the company, but an invisible, although surmisable, influence retained the gentleman in a position out of which, under similar circumstances, any operator unpossessed of the same power over prominent officials, would have been ejected with unceremonious celerity. So the fact that he has finally been ousted is just a little bit surprising. To say that Mr. Allen was very unpopular with the telegraphic fraternity, is putting the case mildly. Mr. Beardslee is now manager of the Western Union office at Sacramento. As it is a position of some importance and desirability, there was quite a contest for the place among two or three other faithful employes of the company, and the gentleman who was successful in getting it. Mr. Beardslee has only been upon the coast a short time, and his promotion in preference to other men who have grown up with the business here has, naturally enough, caused a little grumbling as to the eternal fitness of affairs in general, and the uncertainty of a monopoly’s gratitude in particular.

We are encouraged, however, by the assurance that “Virtue is its own reward,” and by that alone, for we are morally certain that it will never be rewarded by the non-appreciative official at the head of the Pacific Division of the Western Union Telegraph Company.

A number of instances have occurred in which positions a little more desirable than the general average have been filled by men imported from the East. In fact, this practice of ignoring the claims of home operators has been one of the unwritten rules of the company here. Is it true that operators resemble prophets, in not being “without honor save in their own country?”

We would not be understood as reflecting upon the strangers who have come here and filled these positions—they are gentlemen worthy and competent, though no more worthy or more competent than the old employes of the company here. Neither do we deny the right of em-

ployers to employ whomsoever they choose and ignore the claims of old employés at their own sweet will. We simply mention the matter as an item of interest to the poor misguided sinners who are so stubbornly wrong-headed as to imagine that the company they work for will some day reward them for their stupid, persevering industry.

"CALIFORNIAN."

Dec. 15.

#### Cleveland Chronicles.

To the Editor of The Operator:

SIR: Recovering from a season's illness awakens us to a realization of what a boon health is, even as a few days of storm makes us better appreciate the sunshine. We proceed to thank our worthy editor for the sympathy expressed for us in the columns of THE OPERATOR, and in the fullness of our joy we greet all of our friends and wish for everybody a merry Christmas and a happy New Year, which the Cleveland shop windows proclaim to be in the near future.

Business is rather light with us at present though good for this season of the year. The manner of abbreviating the words "household goods" into "h. h. goods" is no longer in vogue, as a serious detriment to the former manner of transmitting them has been found in the fact that business is light and consequently the boys are vigilant in detecting the call of "H." No sooner does the sender start off with "h h goods" than a Cleveland operator breaks in with "ii H." It is provoking to railroad operators, but we are bound to get our work in. The American Union is doing a fair percentage of the business here, and has as fine a corps of operators as ever graced an office.

The changes occurring in the Western Union office here since our last letter may be summed up as follows: On account of sickness in the family of Mr. J. T. Hanford, Mr. G. W. Pattee son has taken the all night job, Mr. Hanford doing day duty. Mr. A. D. Campbell has resigned to accept a more lucrative position with the American Union at Toledo, Ohio. Mr. W. W. Cummings, late of Rixford, Pa., but formerly of Cleveland, succeeding him. Mr. Cummings looks well and we welcome him back to our ranks. Messrs. T. E. Now and H. W. Jeffers have each been granted a leave of absence for a season's rest and recreation. Mr. J. Corrigan has been transferred from day to night duty, Mr. Fred Craig, Jr., from Cincinnati quad to New York Circuit and Mr. P. C. Greenwell from New York quad to New York Press Circuit. We miss our worthy friend Mr. Bob Risdon, from the Detroit end of Cleveland duplex, and regret it exceedingly, as we now have to struggle with students, though there are good men in Detroit.

The excellent make up of THE OPERATOR has won for it a circulation in this vicinity such as no other professional paper ever enjoyed. In your last issue we notice a communication from Indianapolis, the author of which we think we recognize as our old friend, formerly of Columbus; at any rate we venture to say "halloo, 'Sm!'"

I. DUNNO.

CLEVELAND, O., Dec. 20, 1880.

#### Items from Michigan.

To the Editor of The Operator:

SIR: The "Beautiful Snow" is all over us here, and measures about twelve inches. The wires are working strong and business is good.

Mr. F. H. Tubbs, Supt., American Union Telegraph Co., from Chicago, was here recently interviewing the G. R. & I. people relative to a contract for an interchange of business at crossing points, viz.: Sturgis, Mich., Avilla and Fort Wayne, Ind.

Mr. A. W. Gillette has just returned from Chicago, where he has been visiting. He has been promoted and is now chief operator in the general office. He is assisted by Mr. W. A. McGovern, from Reed City, Mich. Mr. Chas. E. Russel, for the past three years with this company, in Grand Rapids, has "cleaned his hooks" and "closed his key" for a while. Charley has gained many friends, socially, among the officials and his fellow employés. He is a good telegrapher, and his "O. K. R." is always ready. When leaving, some of the boys said: "Charley, does your mother know you're route?" to which he promptly replied, "Yes,

Bobs to Muskegon," where, by-the-way, he goes to open a "bucket shop," exchange and broker's office. It is hoped that he will make his fortune and come back to the circuit again soon.

The G. R. & I. and A. & P. Telegraph office, Canal street, is being repaired and changed into one of the handsomest offices in the country. When any of the fraternity are in the Valley City they will be paid by visiting "Ks." Mr. Fitzgerald is manager still, and is assisted by Messrs. Harrigan and Hann, who will be glad to show the boys the—lines.

The Telephone Exchange now has about 185 instruments in working order. The electric light is making quite a blaze here. Fourteen business houses and two of the principal hotels are lighted with it.

GRAND RAPIDS, Mich., Dec. 4, 1880.

#### Milwaukee Melange.

To the Editor of The Operator:

SIR: The marriage boom among the Northwestern operators continues. This week we have the pleasure of announcing two noteworthy events, the marriages of Mr. G. W. Anderson, well known in Western telegraphic circles, to the lovely and accomplished daughter of ex-Senator Spencer, of Arkansas, temporarily residing in the city, and of Mr. J. M. Marlet, a member of the force for some months, and formerly hailing from that noted starting place for operators, Canada, with a charming belle of that northern clime. The Milwaukee end of THE OPERATOR extends congratulations, coupled with the hope that their wedded lives may be strewn with flowers of contentment and prosperity, and as much happiness as is consistent with our poor humanity, but enough of sorrow to add the more to their pleasures.

Octopus has been warned that the manager of the C. & M. telegraph is clamoring for gore and is contemplating some flank movement, just what is as yet undeveloped; but, in the face of such knowledge, we deem it proper to state that our information as regards the plug question was from a reliable source, and we are not to be frightened by threats from showing up all such factories and everything else that may exercise a derogatory influence upon the profession.

There is some talk of a telegraphers' ball, and really we can see no reason why it might not be a great success. Start the ball rolling. How would the middle or last of January do?

Mr. E. E. Brady, night report man on the N. W. side, is at home for the holidays. "Td., of Kansas City," takes his place. A. J. Long has returned from "Bosting." The statue of Commerce has arrived and been placed in position on the new Chamber building. It is as handsome as a Turk, which it greatly resembles. OCTOPUS.

#### Boston Notes.

To the Editor of The Operator:

SIR: As each publication day draws near THE OPERATOR is eagerly looked for, and its semi-monthly advent denotes a pleasurable epoch in our plodding office life.

Not many changes are taking place just now. In fact, not any since the cessation of the Summer business. With the ending of the Summer travel, business fell off very largely, but so many operators resigned and engaged elsewhere that no decrease of the force was necessary. Mr. Harvey Wheeler was the last to leave, on account of small salary and the high price of bananas. While business has fallen off at the main office, it has largely increased at the Old State House, the largest branch city office. Near it are also the American Union and American Rapid offices, and all claim to be doing an immense business. Many firms have tried the Rapid and A. U., but they generally return to the old reliable, feeling satisfied now that their wants cannot be better served than by that company. With the reduced tariffs there will undoubtedly be lively times in telegraphic circles before long.

Boston continues to be the most attractive city in the Union, and in a walk up Washington, Tremont, and Winter streets, and Temple Place, through Jordan, Marsh & Co.'s, and R. H. White & Co.'s, more attractive and elegantly appareled ladies may be seen than in any other city in America. I say ladies—the men are very scarce. They appear to have taken Horace

Greeley's advice and gone West. You see but few men, but the streets are packed with the other element. Boston appears to be a woman town, for you see nothing but women—women and more women.

MORE ANON.

BOSTON, Dec. 17, 1880.

#### TELEPHONE DEPARTMENT.

To-day the telephones keep their usual halloo-day.

The English Government has Boycotted the telephone.

The Lewiston, Me., exchange commenced business June 1st, and now has about 100 subscribers. Mr. J. D. Stanford is the manager.

The decision in the English telephone case, which will be found in another column, makes interesting reading for the telephone people.

President Phillips, of the Niagara Telephone Convention, now holds a responsible position with the American Bell Telephone Co., at Boston.

The employés of the Metropolitan Telephone and Telegraph Company of this city have organized themselves into a society, and will give their first annual reception on the 6th inst., at Tammany Hall.

Mr. F. Overbaugh, the genial manager of the New York Metropolitan Telephone and Telegraph Company, has been presented with an elegant gold-headed cane, by the employés, as a token of esteem upon his leaving the employ of the company.

Our Lowell correspondent writes that the officers of the American Bell Telephone Co., and their employés, are the most genial, honorable and gentlemanly set of men that a person could come in contact with. Their dealings with their licensees are fair and strictly impartial. General Manager Vail and Superintendent of Agencies Madden come in for especial praise.

On the 16th ult., the Connecticut Telephone Company made connection with the Springfield Telephone Company, comprising Springfield, Holyoke, Chicopee, Chicopee Falls, South Hadley Falls, Indian Orchard, Ludlow and North Wilbraham, as well as a through connection with Westfield, Northampton, Worcester and Boston. Subscribers will be charged 20 cents for a connection to Springfield, 35 cents to the offices of the Western Massachusetts Company, 55 cents to Worcester, and 70 cents to Boston.

Nature says that an electric cable manufacturing firm in Neuchâtel have made a highly important discovery in practical telegraphy. After a long and expensive series of experiments, they have succeeded in devising a method of laying cables whereby the induction of the electric current from one wire to another, although the wires are in juxtaposition, is prevented. This discovery, of which no details are yet given, removes, it is asserted, the last obstacle in the way of the widest possible extension of facilities for telephonic communication.

The Manchester, N. H., Union tells the following telephone story: Yesterday a call was received at the central station from Mr. E. M. Slayton's residence, and on the return inquiry from the station as to who was wanted, Mr. Slayton's little girl, a tot about four or five years, hailed: "Connect Mr. Slayton's house with Santa Claus." "What?" said the central operator. "Is this Santa Claus?" came over the magic wire. "No; this is the central office," was sent back. "Hasn't Santa Claus got a telephone?" was the anxious inquiry from the little telephoner. "No; his isn't put in yet." "All right; good-by," was the final response, coming in a very disappointed tone of voice, and the scene closes.

The Supreme Court of Columbus, Ohio, has issued a peremptory writ of mandamus against the Bell Telephone Company and the Columbus Telephone Exchange, compelling the latter to place telephones in the office of the American Union Telegraph Company, notwithstanding the existing contract between the Bell Telephone Company and the Western Union Telegraph Company to the effect that the telephone company shall not connect any of its offices "with any other telegraph company's office or lines," and that "no other telegraph company shall be permitted to become a subscriber." The theory of the court's ruling was that the tele-

phone company is a common carrier, and cannot discriminate against any corporations or class of persons, and that the clauses of contract referred to above are void.

Lowell, Mass., is connected by telephone with over 100 cities and towns in the States of Massachusetts, New Hampshire and Rhode Island. The longest circuit is from Springfield, Mass., via Worcester, Fitchburg, Lowell, Lawrence, to Exeter, N. H., over 150 miles, which is worked successfully. The telephone business between Boston and Lowell, a distance of 26 miles, amounts to \$3,000 annually. The Lowell District Telephone Company, which owns and operates the systems of Worcester, Lowell and Fitchburg, and the lines of the Northern Massachusetts Telephone Company use over 2,500 telephones, and pay the American Bell Company a monthly royalty of over \$1,200. The company controls over 1,500 miles of wire and employs in all divisions about twenty-five ladies and seventy-five men and boys.

Another phase of the telegraph war has been developed in Harrisburg, Pennsylvania. The American Union recently made application in that city to the Bell Telephone Company—which, as is well known, has a special contract with the Western Union—for telephones for American Union offices “at such rates and with such facilities as are enjoyed by other subscribers.” The Bell Company offered telephones to the American Union, provided the latter would sign the usual contract, declaring that the telephone shall not be used for “any toll or consideration to be paid for by any other person than the subscriber, nor for performing any part of the work of collecting, transmitting or delivering any message in respect of which any toll is to be paid to any other party than the Exchange.” As this was just the use to which the American Union desired to put the telephone, that company refused to sign the contract, was accordingly refused the right of renting a telephone, and then brought suit. On the 13th ultimo, Judge Pearson granted an alternative mandamus on the Telephone Company, returnable on December 27, compelling the manager to give reasons why he refuses the American Union telephonic facilities in that city. On the 27th ult., argument was resumed before Judge Pearson, at Harrisburg, but was, by agreement of counsel, postponed until January 5.

## DASHES HERE AND THERE.

The W. U. telegraph messengers of Boston were given a splendid dinner by the merchants of that city on Christmas day.

It is again proposed to introduce a bill in Congress separating the Weather Bureau from the Signal Service of the U. S. Army.

The messenger boys of the Providence, R. I., A. U. office presented Manager Sheehan with a handsome cane as a Christmas present.

The sixth annual re-union of the D., L. and W. R.R. operators was held at Warren House, Hackettstown, N. J., on Christmas Eve.

It was announced, on the 16th ult., that the French Atlantic cable, broken in November last, had been repaired and was again working.

The Saratoga Rifle Club fired a match by telegraph with the club at South Gardner, Mass., Dec. 31. The distance was 200 yards, and the shooting off-hand.

The Weston electric light has been placed in the silver-ware store of R. Strickland & Co., Albany, N. Y., and they have become agents for its sale in that city.

On Nov. 3, 4 and 5, the San Francisco W. U. office handled no fewer than 11,369 messages, and 246,554 words of report—an average of 24½ messages per operator for each hour on duty.

“There is no doubt a class of politicians who, seeing in the adoption of postal telegraphy an opportunity to increase their patronage, would favor it. The sober sense of the country will, however, be solidly opposed to it.”—*Illustrated Scientific News*.

A patent for a new blacking compound has been granted to Mr. Geo. E. Millar, Manager of the Austin, Nev., W. U. office. The principal ingredient of the compound—which is called Millar's Patent Electric Waterproof Polish—is obtained from a common telegraph battery.

On the 14th of December, the Senate adopted a resolution, offered by Mr. Morrill, directing the Committee on Post Offices and Roads to inquire whether or not the existing telegraphic lines interfere with the business of the Post-office Department, and whether telegraphic service should not be placed exclusively in the hands of the general government.

The Mutual Union Telegraph Company of New York placed on record at Washington, Dec. 27, a mortgage for \$350,000 to the Central Trust Company of New York, to secure 350 bonds of \$1,000 each, issued on the telegraph line now being constructed from Washington, D. C., by way of and through Baltimore, Philadelphia, New York City and Providence, R. I., to Boston.

Mr. Geo. Otis, of Provincetown, Mass., writes to say that he takes students from purely philanthropic motives, but does not explain why, if his desire be only to benefit his fellow-man, he should make a charge of even ten cents a lesson. These “philanthropists” do not seem to consider that the overcrowding of the ranks has its effect upon the salaries of all now engaged at the business.

The telegraph cable manufactory of Manly & Sons, Philadelphia, was burned on the 14th ultimo, entailing a loss of \$15,000. The company was engaged in manufacturing a new underground cable which was to have been laid along Chestnut street. Six miles of this cable had been completed when the fire broke out and destroyed five miles of it, one mile being rescued in pretty good condition.

At the last day's session of the National Board or Trade, at Washington, Dec. 17, the first question brought before the Board was a resolution declaring “that the results of the operation of the telegraph in Great Britain as a part of the postal system of the country are such as to commend the adoption of a similar system to the people of the United States.” This resolution elicited a long and interesting debate, but it was finally adopted by the required two-thirds majority vote.

In the suit of the Western Union Telegraph Company against the American Union Telegraph Company, concerning an infringement of what the plaintiff company claims as its right in the Page patent, the Court has, on motion of the defendant company, appointed a commission to take testimony of persons residing in London, Paris, Vienna, and Berlin, by the evidence of whom they propose showing the existence and operation of the devices covered by the Page patent in Europe at a time prior to Page's invention.

Norvin Green, Tracy R. Edson, James H. Banker, T. A. Edison and others have filed, at Albany, articles of incorporation as the Electric Illuminating Company of New York, with a capital of \$1,000,000. The Franklin Electric Light Company of New York City filed articles of incorporation on the 23d ult., with a capital of \$600,000. A preliminary certificate of incorporation of the Edison Electric Light Company of Europe (Limited), with a capital of \$2,000,000, was filed with the Secretary of State on the same day. The certificate of incorporation of the Long Island Electric Light Company was filed on the 20th ult., in the office of the County Clerk of Kings County. The amount of capital stock is \$300,000, divided up in 3,000 shares.

## NEW YORK CITY ITEMS.

### Echoes from 195.

Mr. Jos. E. Fenn has resigned his position of assistant electrician with the A. U. Telegraph Company, and accepted a situation in the electrician's department of the W. U. He has also sold all his patents to the latter company. Mr. Fenn's departure from the American Union will be regretted by the well-wishers of the new company.

Mr. Henry Hoyt, the newly-appointed wire chief of the Eastern division, belongs to a telegraphic family, one of his brothers being an ex-supt. of the Western Union, and another the present Manager of the Halifax, N. S., office. Mr. Hoyt has earned his shoulder-straps through long and meritorious service, his career being wholly free from blot or blemish.

A 195 correspondent says that among the many excellent appointments at the W. U. main office, that of Mr. John H. Dwight as chief operator at large comes pre-eminently to the fore. Mr. Dwight, he adds, is not only a first-class manipulator of the key, but a thorough electrician, and, with malice toward none, he is the noblest Roman of them all.

In response to an inquiry from his New York friends, Colonel Lenhart, of Boston, says that he has not attended Sarah Bernhardt's receptions, and is not indulging in any luxuries. The gallant colonel's application to the General Superintendent for an increase of salary has been respectfully referred to Manager Milliken for investigation and report.

A trial of Gray's harmonic system took place in 195 Broadway, on Dec. 21, five sides being worked on a Boston circuit. The operators were Messrs. Jackson, Cushing, Richardson, Wilcox and A. Wright; 2,200 messages were exchanged in nine hours, a general average of 245 messages per hour or 49 messages per hour to each man. Operator W. H. Jackson's average was 54. The business exchanged, however, was old messages that had previously been sent. The best average made of late on the quadruplex instruments was by Messrs. McLaren and Allen, the former exchanging 432, and the latter 414 in nine hours, being an average of 48 and 46, respectively, per hour on regular business.

### Other City Items.

The office boys of the A. U. main office presented Manager Dealy with a handsome pencil case and pen as a Christmas gift. Mr. Dealy seems to be an exceedingly popular manager.

The illumination by the Brush light of a mile of Broadway, which commenced on the evening of Monday, Dec. 20, has given very general satisfaction. The lamps, which are each equal to about 100 gas jets, are arranged on posts 20 feet high, there being one to each square, alternating on each side of the street from Union square up to Thirty-fourth street. They are all in one circuit and worked by one generator. The cost is about equal to the cost for lighting the same territory by gas, but the electric light gives ten times as much light for the money. A newspaper may be read at a distance of 175 feet from any of the lamps.

At a meeting on Tuesday of the stockholders of the Mutual District Telegraph Company, already referred to in THE OPERATOR, the following directors were elected: T. M. Foote, H. W. Pope, J. A. Hewlett, T. E. Stillman, C. B. Hotchkiss, W. Mynderes, W. W. Rider, J. D. Haines and H. McGonegal. The following officers were then elected: President, T. M. Foote, formerly vice-president and managing director of the American District Telegraph Company; vice-president and general manager, Henry W. Pope, formerly general superintendent of the American District Telegraph Company and late general superintendent of the Metropolitan Telephone and Telegraph Company; secretary, W. W. Rider, late superintendent of the Circular Department, American District Telegraph Company; treasurer, Davison Brown, formerly with Brown Brothers, bankers.

## PERSONAL.

Lou Clarke has been transferred from Tolono to Carbondale, Ill., night office.

Mr. C. E. Thompson has been transferred from Rutland, Vt., to Troy, N. Y., as local repairer.

Mr. John Pender, of Atlantic cable fame, is expected to visit the United States in the Spring.

Mr. D. C. Chandler, formerly operator in St. Paul, Minn., is now with the U. P. Ry., at Plum Creek, Neb.

Mr. L. H. Hall, formerly of the O. & N. W. Ry., is working nights in the train dispatcher's office, Sleepy Eye, Minn.

Ed. Milliken is now night man at general office I. C. R. R., Chicago. Ed. has been subbing in “CH” for some time.

G. L. Baker, late agent and operator I. C. R. R., at Cullom, Ill., has been appointed manager W. U., at Tolono, Ill.

Geo. Z. Fisher, practitioner of dental surgery, a telegraph operator, has accepted a position as day operator at Wamego, Kan.

Mr. Charles E. Page, manager of the American Union office at Cincinnati, O., was married, Dec. 16, to Miss Alice Carey Jones, of that city.

Mr. Osborn, a well-known New York telegrapher, is at present doing the Pacific Coast. He was last heard of at Los Angeles and San Diego.

Mr. Lockwood, formerly of Toronto, is now employed as operator in the train dispatchers' office of the Southern Pacific Railroad at Los Angeles, Cal.

Mr. Thos. S. Collins (the only original Tom) who has been in the employ of the Military Telegraph Co., at Campo, Cal., has been transferred to Prescott, Ariz.

C. B. Fletcher has been appointed manager W. U. at Kankakee, Ill., vice S. L. Nelson, promoted to night train dispatcher at Champaign, Ill., during the absence of G. H. Rhodes.

Mr. Joseph Angell, general passenger agent and superintendent of telegraph of the Delaware & Hudson Canal Co.'s railroads, has tendered his resignation, to take effect Jan. 1.

Mr. J. B. Stearns, the inventor of the duplex, has returned from England, and will soon go to Mexico, to assist in laying the new cable from the mouth of the Rio Grande to Vera Cruz.

Mr. Griffith Owen, who has served the W. U. Co. for a number of years as local repairer at Troy, N. Y., has been appointed batteryman at Albany, N. Y., in place of Mr. Anthony Hedley, deceased.

Rev. Orville Coats, an operator of several years' experience, now a student in Madison University, occupied the pulpit of the Tabernacle Baptist Church in Albany, N. Y., morning and evening, Sunday, Dec. 19.

On the night of Dec. 14, the Cleveland (O.) Co-operative Stove Co., in which Manager H. L. Melton, of the W. U. was a stockholder, was burned out. The loss to the stove company was about \$85,000. Insured for \$60,000.

Readers of THE OPERATOR who know the man, even by reputation, will be interested, not to say delighted, to read in our Pacific Coast Notes, in this issue, that Manager Allen, of Sacramento, has retired from the telegraph business.

Mr. Dennis, who lately went to the Pacific Coast from New York, has been varying the monotony of regular duty in the San Francisco office by substituting for Mr. Bennett at San Luis Obispo, while the latter enjoyed a vacation.

Ed. Davis and James Holter are the operators at the P. & E. R. R. depot, Milton, Pa. Charles Wineland and Joe Miles are at the P. & R. depot. H. S. Hause and E. B. Fowler are at the junction of the P. & E. & P. & R. R. R. Jno. Wolfinger, Jr., is manager of the Western Union office, and W. A. Fisher manager of the American Union.

At the 115th annual communication of Mount Vernon Lodge, No. 3, F. and A. M., of Albany, N. Y., held Monday evening, Dec. 20, the following were among the officers elected: Junior Warden, Heman L. Waterbury; Senior Deacon, Charles E. Shelley; Member of Finance Committee, Henry V. Shelley. All of these gentlemen are well-known telegraphers, employed in the W. U. Co.'s Albany office.

Mr. Chas. Kleppinger, for the past three years manager of the W. U. Tel. Co., at Terrebone, La., has accepted the position of passenger conductor on the Morgan, Louisiana & Texas Railroad. Mr. Kleppinger is well deserving of the position he has gained by ability and a close attention to his duties. His place is filled by Mr. Chas. A. Wood, late Manager American Union office, Asbury Park, N. J.

Mr. A. T. Langehorne, chief operator W. U. office, Indianapolis, Ind., died in that city Dec. 19, of consumption. The funeral took place with masonic honors on the following Tuesday, and was very largely attended. The pall bearers were Mr. Gus Fuller, night chief; Mr. M. D. Butler, manager; John G. Blake, night manager; J. C. Wilson, manager telegraph office Union Depot; Alfred Winder, formerly chief, now operator W. U., and W. W. Smith, supt. telephones, all masons. Mr. Langehorne was exceedingly popular with his subordinates.

CHICAGO.—Mr. A. C. Murphy has gone to Des Moines, Iowa; Mr. William Ernesthausen, to Cincinnati; Mr. J. M. De Long has left for New York. Mr. Githens, who was summoned home

to Keokuk, Iowa, lately by his father's death, has returned. The following are taking vacations: Mr. Warren A. Baker, at Marshall, Mich.; Mr. W. L. Cullen, Toronto, Ont.; Mr. George Stapley, Belleville, Ont.; Mr. Edward Quick, St. Louis, and P. N. Collett, St. Paul, Minn. Your correspondent would be glad if these gentlemen would interest themselves, while on their vacations, in getting subscribers for THE OPERATOR, which their friends need only see to appreciate.

INNEWRI.

SUNBURY, PENNA.—Mr. Jacob Swenk is division operator, and Mr. William Bachman assistant train runner, for the Sunbury Division railroads. The P. and E. R. R.'s "Dy" office has Mr. Bridgens, day man, and Mr. Robert Grant at night. They expect soon to put two men on day duty. At the Western Union office Mr. H. L. Haupt is manager during the absence of Mr. Robert McCartney, in the Harrisburg Western Union office. At the American Union office, Mr. John McCormick is manager. Mr. Will Malick manages the Shamokin Crossing and warehouse. Mill Siding, the favorite country residence, is in charge of Mr. Samuel Gearhart. The dispatcher's office, at the Northern Central R. R. ("R. F.") is well managed by Mr. E. G. Young at day-time, and by Mr. F. S. Strickler at night-time. Mr. E. L. Taylor has just returned from a trip to his home. Mr. F. S. Spencer is "extra operator" for the P. and E. R. R.

On the evening of Dec. 17, a pleasant little affair took place at Harrison, Ont. Mr. C. Omera, the agent and operator of the T. G. & B., was taken by surprise by about one hundred people driving to his place and fairly taking possession of it. After enjoying a remarkably good supper, which came from baskets innumerable, an able address was presented to Mr. Omera, to which he made a suitable reply. Accompanying the address was a purse containing one hundred dollars, given by the members of the Fordwich, Gorvie and Wroxeter Church of England congregations. Mr. Omera, who is studying for the ministry, has, for the past six or seven months, taken charge of the mission in the absence of a regular ordained minister. During his short administration among us, he fairly won the hearts of the people by his preaching the gospel pure and simple, as well as by his kind and genial manner. It is with the greatest regret we have to part with him, and we predict for Mr. Omera a future in the ministry that will be an honor to him and the Master he serves.

R.

VALLEY RAILWAY, Ohio.—Several changes have recently taken place on this "short line." Mr. A. L. Shaffer, who was agent and operator at Peninsula, resigned to accept a much more responsible and lucrative position, for same company, at Canton. At present Mr. Shaffer is acting agent at Canton, vice Mr. W. C. Greenwood, resigned Dec. 15. Mr. T. H. St. John, formerly operator and assistant agent at Canton, has been appointed agent and operator at Peninsula. "D. M." is a genial fellow and good operator, and, being a bachelor, bids fair to soon become a Benedict. Mr. W. N. Bell, has been appointed agent and operator at Everett, vice W. O. Halstead, resigned Nov. 17, and now operator and clerk at East Akron station. Mr. W. M. Close has been appointed agent and operator at Krumroy, vice W. W. Rohn, resigned Nov. 15. I am sorry to say that THE OPERATOR is not taken by many of our boys. This is not as it should be, and we hope that the time will soon come when THE OPERATOR will be found in every office on this line.

"W."

GREENTOWN, Ohio, Dec. 21, 1880.

KANSAS CITY, Mo.—In my former notes and personals I inadvertently omitted to mention the A. & P. office, which is quite an "institution" here. They work one duplex circuit with St. Louis, which also connects the Board of Trade rooms between these two cities. The A. & P. furnish "C. N. D's" to our Board. They also are in connection with the Chicago B. of T. by direct wire through the W. U. office. Besides these connections they have one way wire north to Omaha. L. D. Stanley is manager, assisted by T. J. Thorn and Carl Clark is the night press operator. The telegraph fraternity of Kansas City have just united in a nearly unanimous call for a preliminary meeting, wherein to discuss the propriety of forming an Electric Society. The call is signed by nearly every operator and electrician in the city. This meeting will prob-

ably be held some night next week. W. E. Done, of the W. U. office, has resigned and been appointed manager of the Harlem, Mo., office. R. D. Blumenfeld was granted leave of absence to visit his home in Wisconsin, from Dec. 16 until Jan. 3. Several others from the W. U. office are promised short vacations during the holidays.

\* \* \*

PHILADELPHIA, READING AND POTTSVILLE LINES.—The personnel of south wire No. 1., P. R. and P. T. Co., comprises some well-known operators, as may be seen from the following: Messrs. Shea, McPayle and Ruddoch are at "X" office, Philadelphia, and the following array of talent dotted, like stars, along the line: At Falls, Mr. George Wilcox, manager, ably assisted by Messrs. Reardon and Gaul, the latter being "owl." At Spring Mills siding, Messrs. Whitehead and Fred. Wood, day and night respectively, attend to the register. Mr. William Pennington is day operator at West Conshocken; Mr. Reid, night man. Mr. H. J. Brown, familiarly known as "Browney," is manager at Bridgeport, assisted by Mr. Epright, while Mr. George S. Heaney attends to "19" reports at night. At Merion siding, there are Messrs. Lew. Buckley and John Beitenman, day and night respectively. Miss Covington is at Pt. Kennedy and Mr. Daniel Webster at Valley Forge. Messrs. C. B. Melot and George W. Vanderslice are at Perkiomen Junction, the latter for the Perkiomen Branch; while Mr. Palsgrove attends to affairs at night. Phoenixville is well managed by Messrs. Harry Keeley (days) and Ed. Leopold (nights). Messrs. Barlow and Miller attend to the day and night work, respectively, at Aramingo. At Pottstown, there is Mr. O. E. Barlow (days) and Mr. Palmer (nights). At Monocacy, Mr. James Powers (days) and Mr. Wells (nights). At Birdsboro', Mr. Epiheimer (days) and Mr. Brown (nights). At Exeter siding, Messrs. Levan and Hawden, day and night, respectively. At the dispatcher's office, Reading, the familiar "29" of Mr. J. H. Boyer is heard all day long, and the amount of work he does in a short time is astonishing.

## BORN.

COLWELL.—Dec. 19th, 1880, to Mr. Charles Colwell, W. U. telegraph office, at Columbus, a daughter.

## MARRIED.

FLIPPEN—SHIELDS.—Dec. 22, 1880, at Vicksburg, Miss., by Bishop F. W. Adams, Mr. W. E. Flippen, Manager W. U. Tel. Co., to Miss Mattie F. Shields.

ARNOLD—FISH.—Dec. 7, 1880, at New London, Conn., by Rev. W. W. Buckingham, Mr. Edgar M. Arnold, Manager W. U. Co.'s Glens Falls, N. Y., office, to Miss Gustava E. Fish.

AMES—MELINS.—Nov. 9, at Albany, N. Y., by the Rev. T. Harwood Pattison, Mr. Judson Ames, local repairer, W. U. Co., to Miss Annie M. Melins, both of Albany.

CUSHING—SIMMS.—Dec. 9, 1880, at the residence of the bride's parents, Myrickville, Mass., by Rev. Charles Stokes, Mr. John Franklin Cushing, of Myrickville, to Miss Mary Simms (late operator at Myrickville station), daughter of William Simms, Esq.

RICE—GILMOUR.—Nov. 25, 1880, at the residence of the bride's parents, near Albany, Oregon, by Rev. P. S. Knight, of Salem, Mr. Will B. Rice, agent Oregon & California Railroad, Albany, to Miss May R. Gilmour, only daughter of Jos. P. Gilmour, Esq.

LENTZ—JONES.—Dec. 14, at residence of bride's parents, near Quincy, Mich., S. R. Lentz, agent, to Miss Rosa F. Jones, operator, I. C. R. R., Arcola, Ill. The happy couple will spend a month in Colorado and New Mexico, after which they will resume duty at Arcola.

## DIED.

CANNON.—Dec. 25, 1880, at Buffalo, N. Y., Peter F. Cannon, Operator American Union, formerly of the W. U., aged 23 years.

LUDWIG.—Dec. 20, 1880, at Salem, Mass., of typhoid fever, Hartford W. Ludwig, of Waldsboro, Maine, late operator at W. U. office, Salem, Mass.

## EVERY

### ENTERPRISING TELEGRAPHER

### SHOULD HAVE THE

## EMBLEMATICAL

# "Operators' Card."

I wish to call the attention of every operator throughout the country to a card, which is a carefully studied design, and which is giving excellent satisfaction wherever circulated. It is

### A MODEL OF NEATNESS,

Having different tints and styles of corners, and a gold beveled edge. Across it, in colored ink, is a beautiful representation of

### "AN OPERATOR AND HIS WORK,"

which has been designed and engraved expressly for this purpose. The card bears the name of the operator and address in appropriate type. This is the only card of the kind ever introduced, and is furnished at the very low price of

25 Cards for - 50 Cents.  
75 " " - \$1.00.

Orders promptly filled and satisfaction guaranteed, or money returned.  
Send silver wrapped in paper, or scrip.  
Great inducements to those wishing an agency.  
Information cheerfully given.

Any of the above promptly mailed, postage prepaid, on receipt of the price.

## SPECIAL AGENTS' OUTFIT

We are anxious to secure a very large number of agents everywhere, both for THE OPERATOR and for the books we publish. Those in a position to act for us will oblige by making a beginning at once.

Should specimen copies be desired, drop us a postal card, and they will be immediately mailed you free.

Experience has demonstrated that the best selling books we publish are

TALES AND HISTORY,  
THE DICTIONARY  
AND WIRED LOVE.

That agents may be equipped for taking orders at an insignificant cost, we will send all three of these books, for use as samples, prepaid, on receipt of \$2.

Any of our other books at the same rate.

THE OPERATOR for fifteen months can be added to the above for one dollar extra.

## HOW SOME OF OUR BOOKS MAY BE SECURED FREE.

Although the subscription price of THE OPERATOR is so low that little margin for liberality remains, yet to any one sending us a club of four yearly subscriptions (old or new)—their own and three others will do—we will mail, free and postage prepaid, as a premium, a copy of either "Telegraphic Tales and Telegraphic History," the Dictionary, "Lightning Flashes," "Christmas Evergreens," or "General Grant," bound in cloth, or a copy of THE OPERATOR for one year.

Any two of these books for a club of eight yearly subscriptions; any four for fifteen yearly subscriptions; or the five for eighteen yearly subscriptions.

To any one sending us three yearly subscriptions as above, we will mail a copy of "Oakum Pickings," cloth, "Wired Love," cloth, or "Sam Johnson," paper.

To any one sending us two yearly subscriptions, as above, or their own and that of a friend, we will mail a copy of "Oakum Pickings," bound in strong paper, or a copy of "Telephone and Oshkosh."

All 9 Books for 25 Yearly Subscriptions.

A Silver Watch for 60 Yearly Subscriptions.

A Gold Watch for 160 Yearly Subscriptions.

Two half yearly or four three-months' subscription count same as one yearly subscription. Names can be sent in as fast as received, which will be placed to your credit, and can be added to at any time. Remit with each order. A cash commission, in lieu of premiums, will be allowed where such is preferred.

W. J. JOHNSTON, Publisher,  
No. 9 Murray St., New York.  
P. O. Box 3332.

## THREE POPULAR BOOKS UNIFORM IN SIZE.

New Edition Just Published!

Uniform in Size with "Tales and History" and "Oakum Pickings."

## "WIRED LOVE;"

A ROMANCE OF DOTS AND DASHES.

BY ELLA CHEEVER THAYER.

The "Old, Old Story" in a New, New Way.

THE FIRST AND ONLY TELEGRAPHIC NOVEL, AND THE ONLY TELEGRAPHIC BOOK OF ANY KIND

WRITTEN BY A LADY.

256 PAGES. HANDSOMELY BOUND IN CLOTH. PRICE, 75 CENTS.

Having already issued the FOURTH EDITION of this admirable Telegraphic Love Story (which fact sufficiently demonstrates its popularity, both in and out of the profession), Mr. Johnston takes pleasure in recommending the book to telegraphers and others as a most entertaining, bright, sprightly and amusing work, either for summer or winter reading.

## OPINIONS OF THE PRESS ON "WIRED LOVE."

A good book to make you forget business and care, and leaves pleasant memories behind it.—*Chicago Inter-Ocean.*

A capital love story, the affection having its origin in telegraphic communications between two operators unknown to each other, fifty miles or so apart.—*Boston Commonwealth.*

The plot is well conceived and has several touches of originality in the handling. It is wide-awake, and will interest all who would like to read the old story told in a new way.—*New York Graphic.*

The book is written in an easy, off-hand style, pervaded with quiet humor, and its sentimental portions contain some suggestions of wisdom that are expressed with great force, beauty and originality.—*Boston Herald.*

A most original little book. We have had Cupid under all sorts of guises, with arrows barbed with all sorts of incongruous things, but never before have we had him using for a weapon the immortal invention of Morse.—*Boston Traveller.*

The love-making which goes on is done over the telegraph wires, and there is plenty of humor and a dash of mystery about the story which makes it refreshing reading. The heroine is a telegraphic operator, and the way in which her acquaintance over the wires with a fellow operator ripens into something more than friendship, is very pleasantly told.—*Boston Journal.*

A love story in which the chief personages are operators, and much of the conversation is by wire from station to station. The writer, Miss Ella Cheever Thayer, has shown

ingenuity in developing the situations of courtship under such circumstances, and made a bright, readable story, which will have peculiar attractions for the telegraphic fraternity, and, we must add, sisterhood.—*Boston Advertiser.*

The plot is original and the story written in an easy, humorous style that cannot fail to be appreciated. The adventures of poor Quimby, the hero of so many catastrophes, with his patient "I am used to it," will cause many a hearty laugh, and would alone made the book a success. Every one who wishes to read a bright, original book, and desires a good laugh, should buy "Wired Love."—*Boston Transcript.*

Making love by telegraph has perhaps not been infrequent since the general use of that wonderful invention: but for a young girl to fall in love with an operator without having seen him, merely from the way in which he sends messages, is something new. How that came about and what was the result of it, can be seen in a vivaciously written novel, "Wired Love," by Ella Cheever Thayer, just issued.—*New York Mail.*

This romance of dots and dashes is a new departure, and most assuredly the best of the season in the way of light, or "vacation" literature. No reader but will hereafter have a little more respect for the ungainly telegraph poles which adorn our land; and the prosaic and common-place "sounder and key" will hereafter wear a veil of sentiment and romance. It is spicy and original; the interest is kept up throughout, and for the mission which it is meant to fulfill it is a most admirable work.—*Portland (Me.) Argus.*

Copies promptly mailed, prepaid, on receipt of price, 75 cents. Postage stamps taken.

"Wired Love" and "Tales and History," together, postage prepaid, \$1.50. "Wired Love" and THE OPERATOR, one year, \$1.50. "Wired Love," "Sam Johnson," and "Tales and History," \$2.00. "Wired Love," "Sam Johnson," and THE OPERATOR, one year, \$2.00. Any of our other \$1 books, in lieu of "Tales and History" or THE OPERATOR one year, at the same price.

A copy of "WIRED LOVE" will be mailed free and postage prepaid to any one sending us a club of three yearly subscribers to THE OPERATOR. Their own and two others will do.

New Edition Just Published!

Uniform in Size with "Tales and History" and "Wired Love."

## OAKUM PICKINGS:

A Miscellaneous Collection of Stories, Sketches, Essays, and Paragraphs, Telegraphic and General, By Walter P. Phillips, "John Oakum," with a fine Steel Plate Portrait of the Author.

Fourth Edition, 188 pp.; Medium 12mo; Paper, 50c.; Cloth, 75c.

The welcome accorded this, the first book ever published with the object of giving the telegraph profession a literature of its own, has been general and hearty, on the part of both telegraphers, press, and general reading public in all parts of the country. Mr. Phillips, the author, is well known to the fraternity as a spicy, original, witty, entertaining, and popular contributor to telegraphic and humorous literature, and his character sketches of "Jim Lawless," "Tip McClosky," "Posie Van Dusen," "Cap. De Costa," etc.—all of which are contained in Oakum Pickings—have won for him an enviable reputation as a humorous sketch writer.

What the Newspaper Press has to say of "Oakum Pickings":

Highly amusing.—*N. Y. Times.*

Bright, witty, and full of humor.—*Publishers' Weekly.*

Short, realistic, lively sketches, illustrative of his own profession.—*N. Y. Tribune.*

There is not a dull page in the work.—*Telegrapher.*

If you can read the book without saying, "John, go and

do so some more," you are less susceptible to what is good than we are. Try it, and see.—*Elmira Advertiser.*

The best fancies of a fertile brain, smooth in style, and epigrammatic, but not flashy. There is in them all a quiet undercurrent of quaint dryness, that is irresistibly attractive.—*American Bookseller.*

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, on receipt of.....\$2.00  
The three books and THE OPERATOR one year, or any \$1 book..... 2.75  
The three books, THE OPERATOR one year and "Sam Johnson" (cloth), or any \$1 book.... 3.50

THE

American Bell Telephone Co.

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly, or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This Company desire to arrange with persons of responsibility for establishing

DISTRICT OR EXCHANGE SYSTEMS,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as agents, for the purpose of establishing

PRIVATE LINE

AND

CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company, No. 95 Milk street, Boston, Mass.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

# THE DELANY PATENT REVOLVING DISC,

OR

UNIVERSAL PLATINA CONTACT KEY.

PRICE, \$5.

114 South Second Street, Philadelphia, Pa.

# THE PHILLIPS PATENT KEY.

"THE ONLY!"

Price,

\$3.00.

Price,

\$3.00.

Curved or Straight Lever. Sticking Abolished. No Platina Points. Light Lever. Long Leverage. With eleven years' experience I have been unable to find anything in the telegraph instrument inventions that comes to an operator's relief as this Key has. The one you put in at this office gives great satisfaction to all. The circuits west from here are worked to Cincinnati without repeater, and to Chicago with but one, and in the handling of 70,000 to 90,000 words of specials on these circuits with your key I have the first time to hear the sender or receiver complain of a "stick."

J. A. HUTCHISON, Night Chief American Union office.

To meet the requirements of all, we are making the Phillips Key with both Straight and Curved Levers.

BOX OF HALF-DOZEN EXTRA POINTS, 25 CENTS.

L. C. TILLOTSON &amp; CO., Sole Agents.

TELEGRAPH AND TELEPHONE SUPPLIES OF EVERY DESCRIPTION,

5 and 7 Dey Street, New York.

## THE FOLLOWING TABLE OF CONTENTS

will give some idea of the style and scope of our new book,

## TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY,

which is now attracting so much attention

PRE-ELECTRIC TELEGRAPHS.....	7
Signaling among the ancients—Telephonic system of the African negroes—Signaling by sound in Montenegro—Fire communication in war and otherwise—Dr. Hooke's telegraph—The semaphore—Semaphoric blunder and its result—The word "telegraph"—Prediction quoted by Addison.	
THE ELECTRIC TELEGRAPH—ITS BEGINNING AND DEVELOPMENT.....	14
First lightning-rod man—Frictional electricity discovered—The Leyden jar—Experiments to Franklin's time—His famous kite experiment—Robert Stephenson's boyish imitation—Lomond's electric signals—Lesage's invention of electric telegraph, using twenty-four wires—Reiser's thirty-six wire telegraph—Succeeding experiments to Morse and subsequently to present time.	
INTRODUCTION OF THE ELECTRIC TELEGRAPH IN THE U. S.....	29
First American line—Apathy of scientists, press and public—Why the <i>Herald</i> refused to encourage the telegraph—Cornell and Morse—First apparatus—Interesting relic—First week of telegraph—Slender returns—Humors of early-day telegraphy—Countryman, turkeys and telegraph—Mr. Stearns and obstreperous church bell—Honor to whom honor is due—Ronalds—Morse—Henry—Vail—Claim for laborers—"Be jabbers, who dug the post holes?"	
A CHAPTER ABOUT OPERATORS AND MESSENGERS.....	50
The operators' view of human nature—Their faithfulness—Their literature—Their difficulties and trials—Epileptic telegrapher—Armless operator—Deaf operator receiving by sound—The "lightning striker's" blunder and a case of jealousy—Recognizing by touch—Love over the wire—Love disappointment in humorous verse—First marriage by telegraph—Absconding operator caught by novice—Wonderful speed in telegraphing—Messenger service—District telegraph boys and the various duties they perform—Anecdotes of them—Unformed messenger mistaken for policeman.	
THE TELEGRAPH IN WAR.....	70
Earliest military signaling—Introduction of field telegraphy—Field telegraphy described—Dangers to apparatus—Firing guns by electricity—Telegraph in civil war—Its great value—What General Sherman said of it—Origin of U. S. Military Telegraph—Cost of service during war—Duties of cipher operators—Official acknowledgment of their services—Anecdotes of military operators' ready wit, heroic courage and nervousness—Funny war story—Another—Military operators' poor quarters—A provident telegrapher—Richmond taken—Receipt of the great news—Lincoln's assassination—Grand feat of Prussian soldier, and heroism of French female operator.	
CABLE TELEGRAPHS.....	95
General—The Atlantic cable—First suggestion of it—Its origin—Organization of company—Laying cable—The Great Eastern—Discouragements—First message—Suggestor wittily silenced by Mr. Field—Cost of first Atlantic cable—Recent improvements in cable laying—Mr. Field's services—Cable operators—Cable codes—A specimen—Its interpretation.	
HUMORS OF THE TELEGRAPH.....	107
Economical Irishman—Timid old lady—Apprehensive Texan—Witty, incongruous and rhyming telegrams—A "killing" blunder—The "additional wurred"—A furious message—Satchel by telegraph—Snubbing a king—A proper old lady—Little "Johnny Russell"—Peter to Margaret Flagarty—He couldn't be fooled—"She writes like a man"—Model (?) Maine man—Hollow and "hello"—Fooling savages—"Onnateral fixins"—Chicago and —Witty illustration—Electrifying loafers—Shocking the negroes—Blind-folding the "masheen"—A crammer.	
TELEGRAPHIC "BULLS".....	123
A fatal "bull"—Matrimony killed by a "bull"—Instances of operators' "bulls"—A lord's mistake—John Brown and Seaton Bros.—Ale or oil—Too much coffee—Blessings in disguise—A profitable mistake—A military "bull" that was not all a "bull"—Senders' "bulls"—Habit and habit—"Bulls" from bad spelling—A fishy story—Tragic "bull"—Injustice to operators.	
LIGHTNING FREAKS AND TRAGEDIES.....	138
Deaths from lightning—Effects in different countries—A triple tragedy—Curious freaks of lightning—Some wonderful instances—Lightning in telegraph offices—Operators killed.	
SHARP PRACTICE BY TELEGRAPH.....	143
Abuse of General McClellan's name—A modern "St. John"—Big swindle in Toledo—"Spiritualistic" swindling—Rappers' tricks—Their magnets—How to make them—Sir Charles Wheatstone's experiments—Two good stories of sharp practice by operators—Tampering with cipher message—The biters bit—Great bank swindle—Barb's telegraphic trap for burglars.	
THE TELEGRAPH AN UNIVERSAL INSTITUTION.....	160
A well-traveled message—Spanish peasants and telegraph—Telegraph in Morocco—China—India—The East in general—Japan—In Africa.	
THE WEATHER REPORTS.....	168
Death of General Meyer—His account of storm signal system—Its value to commerce and agriculture—The New York station—Cipher reports of weather—Difficulties of signal service—Early opposition—Origin of weather reports in the United States—Smithsonian Institution—Professor Henry.	
THE RAILROAD TELEGRAPHIC SYSTEM.....	179
Originated in England—First instance of train dispatching in this country—System at Grand Central depot—Moving trains by telegraphic orders—Official instructions—Train dispatchers and operators—Their responsibility—Thrilling incident—Operator who "forgot"—Noble operator—Latest inventions in railroad signaling—The train telegraph—No more screaming engines—Supplying locomotives with water by electricity—Fun on the railroad—Waking the Pullman porter—Operators' anti-suporific.	
ELECTRICITY AND LIFE.....	202
General remarks—Electric girl of La Ferriere—Electrical lady of Nevada City—Electricity on dinner table—Feeling pulse by telegraph—Development of growth by electricity—Uses in surgery and dentistry—Electricity as a healer—An "anti-fat" story.	
OUTGROWTHS OF THE TELEGRAPH.....	218

## Lightning Flashes and Electric Dashes;

A VOLUME OF

Choice Telegraphic Literature, Humor, Fun, Wit and Wisdom.

CONTRIBUTED TO BY

ALL THE PRINCIPAL WRITERS IN THE RANKS OF TELEGRAPHIC LITERATURE, AS WELL AS SEVERAL WELL-KNOWN OUTSIDERS.

COPIOUSLY ILLUSTRATED.

176 Large Octavo Pages. Cloth. Price, \$1.

This book is a lasting example of the literary talent and native wit of American telegraphers, all the lights of the profession having banded together to give us a book well worth reading.

"Every person who has the fortune to see this volume will desire to possess it."—*N. Y. Hebrew Leader*.

"Written in a bright and sparkling style, and the numerous illustrations lend an additional interest to the work."—*N. Y. Graphic*.

"The interest of the reader commences with the initial chapter, and from this to the end of the volume there is nothing but a succession of pleasurable surprises."—*Harrisburg (Pa.) Independent*.

"Thoroughly telegraphic and highly amusing, the cartoons cleverly executed, the narratives pithily and in part brilliantly worded, while the variety supplied will make it difficult for any who may have the privilege of reading the book to do so without enjoyment."—*London (Eng.) Telegraphist*.

THE OPERATOR, 15 Months, and Lightning Flashes, only \$2.00.

## DISCOUNT ON ORDERS FOR BOOKS.

Where any of our publications to the value of \$4.00 or over are ordered together, the purchaser may deduct

25 Per Cent.

from the regular retail price before remitting. The books will then be forwarded, post age or express charges prepaid. All orders filled on the date of their receipt.

We will send to the same or separate addresses any two of the books marked at \$1.00 for \$1.75, and THE OPERATOR for fifteen months in connection with any one dollar book for \$2.00.

## How Enterprising Operators may Add to their Incomes.

Enterprising operators along the line of railroads and in large cities can add a comfortable sum to their income by selling our books to their co-laborers and friends, and availing themselves of the liberal discount which we give to agents.

Canvass your district, then send us an estimate of how many books you can dispose of, with their names, and we will give you such a rate on the entire consignment as will leave you a respectable margin for yourself.

Address, for particulars,

Original and only Manufacturers in the U. S. of

**PURE GUTTA-PERCHA GOODS,**

**422, 424, 426**

**EAST TWENTY-FIFTH ST., N. Y.**

ESTABLISHED IN 1847.

### S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description, under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA for Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds.

**Submarine Telegraph Cables**, 50 varieties, one to ten conductors.

**Submarine Telegraph Canal Cables**—any number of conductors.

**Aerial and Underground Cables** of all styles. Hemp armor covered.

**Lead-Covered Telegraph Cables**, one to seven conductors.

**Office Cables**, one to seventy-five conductors, gutta-percha and cotton-covered.

**G. P. Insulated Wire** of all sizes.

**Fuse. Leading and Connecting Wires** for submarine and mining purposes.

**Marks' Compound Office Wires**, various sizes, for office, underground, and outdoor use.

**G. P. Office Wire**, cotton-covered.

**Flexible Elevator Cables**, any number conductors desired, of every style, and for all purposes.

**Compressed Electric Cotton and Linen Double and Triple Covered Cordage** any style or pattern.

**Burglar Alarm, Call Bell and Annunciator Wires**, double cotton wrapped and saturated with any preparation.

**Magnet Wires**, copper and German-silver, cotton, silk, and fibre covered.

**Copper Wires**, specially covered for electrical lightning purposes.

**Telephone Flexible Cords and Magnet Wires**, finest and best manufactured.

Agents for Reception of Orders and Sale of Goods:

# THE TELEGRAPH CONSOLIDATED MINING COMPANY,

PIONEER DISTRICT, PINAL COUNTY,  
ARIZONA.

Capital Stock, \$2,500,000, in 100,000 \$25 Shares.

## OFFICERS:

EARNEST A. DES MARETS, President (N. Y. Stock Exchange); C. C. MURPHY, Vice-President; LINDLEY F. SEAMAN, Secretary and Treasurer. Board of Trustees—THEODORE WILLIAMS, VERNON SEAMAN, C. C. MURPHY, W. F. CLEWELL, JOHN A. ROBERTSON. Financial Agent, THEODORE WILLIAMS (N. Y. Mining Exchange), No. 58 Broadway, New York. Register of Transfers in N. Y., UNION TRUST COMPANY. Counsel—REMINGTON VERNAM, No. 198 Broadway, New York. Hon. A. W. BLAIR, San Francisco, Cal. Mining Superintendent, F. C. BENTON.

For the information of those who may not be acquainted with the mining interests of the country generally, the Company would state that Arizona is fast coming to the front as a wonderful treasury of precious metals; and the Silver King Mine, situated one mile south easterly of the Telegraph Mine, alone has produced for its fortunate owners since its discovery in 1875 upwards of \$3,000,000. For miles on either side of this property the country is being extensively worked to a profit by many enterprising companies, and it is not unreasonable to believe that the prospects of this company (to which attention is especially called) are in every respect favorable for all who may feel inclined to investigate its merits.

NONGUES, 411½ California street, San Francisco, Agent in California; JAMES A. HENNESSY, Superintendent of Mine. PLATT, GERARD & BOWERS, New York, and MOSES G. COBB, San Francisco, Counsel; Register of Transfers in New York: UNION TRUST CO.

Principal Office:

No. 58 Broadway, Rooms 22, 23 and  
24, New York.

This property is situated on the south bank of the Merced river, and comprises 3,000 feet, continuous, on the lode northwest of the well-known and valuable Hite Mine.

The vein is a true fissure, with a general width of from ten to twenty feet, and is undoubtedly a continuation of the Hite vein, from which property some \$5,000,000 has been taken. The main shaft of the Hite Mine is within 250 feet of the south line of the North Hite. The ore assays from a trace of gold to \$1,500 per ton, and an average of \$20 to \$30 may be depended upon.

### STILL SINGLE.

I stood by the "Blake Transmitter,"  
For the telephone bell had rung,  
And over the wire a sound came  
As though a maiden sung  
A musical tone quite familiar,  
Her voice I had often heard,  
For in answering daily telephone calls  
We had interchanged many a word.

Have you never received a letter,  
And paused ere breaking the seal,  
As you thought concerning the tidings  
That the contents might reveal?  
Did not a longing possess you  
To know what was really within,  
And yet to avail of that knowledge  
You seemed in no haste to begin?

In some such manner I tarried  
At the end of our telephone wire,  
Then at last, mustering courage sufficient,  
Began at once to inquire:  
"Well, halloo! well, what is wanted?"  
It seemed at least all I could do;  
When quick in return came the message,  
"Halloo! well, halloo, who are you?"

"Why, I am 'forty-eight,'" I responded.  
"You called only a moment or two."  
"Forty-eight," she repeated in answer,  
"Well, surely I don't wish for you."

I was giving my telephone number,  
As found on the company's page.  
But I fear, from her hasty answer,  
She thought I was giving my age.

Alas, that the blow came so sudden;  
I received it bewildered, alone—  
As the consciousness dawned there upon me,  
Rejected by telephone.

### A VAST MONOPOLY.

**Consolidation of the Western Union, American Union and Atlantic and Pacific Telegraph Companies.—The most Gigantic Telegraphic Combination the World ever Saw.**

The surprising announcement was made on Wednesday last that the two great competing telegraph companies, the Western Union (with its auxiliary, the Atlantic and Pacific) and the American Union, had decided to amalgamate, and form one gigantic organization. No official announcement of the terms has been made, nor will any be made until they have been submitted to and ratified by the various boards of

directors. For this purpose the Western Union has called a meeting of the board for Wednesday next, Jan. 19. The Atlantic and Pacific has called a meeting of its shareholders for Saturday, Feb. 5, to discuss "an agreement for the sale of the franchises and the property of the company to the Western Union Company."

When our last issue went to press there were no indications of a possible amalgamation; and it is now authoritatively stated that the negotiations which led up to the consolidation were not formally begun until the 2d inst., and that the first overtures came from the Western Union. The readers of THE OPERATOR have been already fully apprised of the details of the "telegraph war," a contention which, as it appears now, gave the greatest annoyance to the officials of the Western Union. About two months ago, immediately upon Mr. Vanderbilt's return from Europe, he was served with a notice to remove Western Union wires from the line of the Pennsylvania Railroad, and its operators and instruments from the railroad offices in New Jersey. That notice, which is referred to in another column, was to have taken effect on the 7th inst. Mr. Vanderbilt, evidently weary of the constant annoyance and expense, then made a proposition for a consolidation; but, after two days' consideration, it was rejected by the American Union. The relentless fight then went on, and the American Union at once proceeded to show its power. The "bear" movement in Western Union stock was commenced on the 22d of November, when it was quoted at the close of the day at 102½, having touched 103½. From that day it continued to fall, until just before Christmas. The heaviest assaults were made on Dec. 19 and 20. On the latter day the stock went as low as 77¾. Meantime Atlantic and Pacific varied only from 1 to 3 per cent., and American Union never declined more than 5 per cent. The stock was artificially depressed first by sales or reported sales of stock owned by Mr. Vanderbilt and other members of the directory, and what these stories failed in was accomplished by large reductions of rates and reports of a determination on both sides to wage a bitter war of competition. When the price was sufficiently low, those in the secret began to buy, until the consequent advance alarmed the street, and then the consolidation took place.

This important event was formally inaugurated on Sunday, Jan. 2, by a preliminary understanding, and the next day Wall street was more mystified than ever, there being less than half a

dozen people in the secret. Still, it was evident, even on the first working day of this year (Monday, Jan. 3), that some great event was impending, for on that day the mysterious heavy purchasing movement in Western Union begun on the Stock Exchange. In the succeeding week upwards of 676,000 shares changed hands—much more than the entire capital of the Western Union, while its market value ran up 22 per cent. in the same time. On the following Wednesday, A. and P. stock began to creep upward, though very few could say why, and on the succeeding Saturday (Jan. 8) the American Union fell into line, registering finally an upward movement of 16 per cent.

Meanwhile the principals were hard at work. There were so many conflicting interests to provide for that the propositions looking to a consolidation did not take definite shape till last Saturday. The lawyers of each company were given the memoranda of settlement, and from these they were instructed to frame an ironclad agreement. The lawyers were busy with this document all day Monday, and it is said, that when it was submitted to Mr. Gould, he and Judge Dillon went over it and made some important insertions and additions. These changes were approved by the Western Union interests, and a final meeting was arranged for Tuesday evening, the 11th inst., at Mr. Vanderbilt's house. At this meeting there were present besides Mr. Vanderbilt, Mr. Samuel F. Barger and Mr. Augustus Schell, representing the Western Union and Atlantic and Pacific Telegraph interests, and Mr. Jay Gould, Mr. Russell Sage and Mr. Fred. Ames, representing the American Union. There were few details to be discussed, and a preliminary agreement was signed and ratified by these six gentlemen.

As all the officials refuse to make public the details of this agreement, no positively accurate statement can be given, but the following is believed to be correct: The consolidated company is to retain the title of the Western Union Telegraph Company, with a capital of \$80,000,000. To perfect the company a new certificate of incorporation, with the capital fixed at that amount, is to be filed. The shares of the several companies are to be merged in the consolidated company at a valuation of about 129 for Western Union, 113½ for American Union, and 66¾ for Atlantic and Pacific. This means, practically, scrip dividends of 29 per cent. on Western Union, and 13 per cent. on American Union, making the capital of the first, in round figures, \$53,000,000. The capital of the American Union is

\$10,000,000, but it is also pledged to issue \$5,000,000 of bonds to the subscribers of the Central Construction Company, which furnished the funds to construct its line. These bonds, it is said, will be issued at once, and for the purposes of consolidation the entire capitalization of the company, including both stock and bonds, will be taken as the basis. The valuation of its \$15,000,000 capital at about 113½ equals, in round numbers, \$17,000,000. The capital of the Atlantic and Pacific Company is \$14,000,000 stock. It has no bonded debt. At the valuation of 66⅔ per cent., or thereabouts, its capital is not far from \$10,000,000 in the consolidated company. The three companies will then come into the consolidated company approximately as follows: Western Union, \$53,000,000; American Union, \$17,000,000, and Atlantic and Pacific, \$10,000,000; total, \$80,000,000. It is understood that Mr. Gould, Mr. Sidney Dillon, General Eckert and Mr. Russell Sage are to be elected directors in the new company, and that vacancies will be made for them by the resignation of a corresponding number of the present directors of Western Union.

General Eckert is also to be First Vice-President and General Manager of the consolidated company.

It will be some time, however, before this new scheme can go into effect. The Executive Committee of the Western Union has already issued a call to the stockholders for a general meeting to confirm the increase of capital stock; but as the by-laws of the company require at least two weeks' notice of such a meeting, it is not probable that the ratification will be secured till the end of the month. The Stock Exchange requires sixty days' notice of the increase of any capital stock, so that if the negotiations are successfully terminated, the extra stock will not be admitted on the Stock Exchange till April 1.

The profits of this great scheme have flowed into the pockets of the select few, and the oldest brokers in Wall street say that they never knew of a deal in which the public has lost so much money as this one in Western Union. Hundreds of small operators have been cleaned out of all they had. In fact, it is conceded on all sides that the present move has "caught" more professional speculators in its web than any other previous speculative movement.

We have received a communication from thirteen New York operators inquiring, in view of the consolidation: "Whether the several offices will be maintained as at present? If not, what disposition will be made of the employés, and what the effect on salaries?"

The probabilities, we regret to say, are that many offices will be closed and many employés be thus thrown out of employment, which cannot but have the effect of reducing salaries. We can only hope—and we should not be surprised to see it—that some hitch may occur to at least postpone the consolidation; or, if not, that the rapid growth of the business will furnish employment to most, if not all, of those now engaged in it, so as to prevent a repetition of the overcrowding of the ranks to which we were treated after the Western Union-A. & P. pooling arrangement.

Although there does not seem at present to be a very brilliant prospect for a competing company, still we probably shall have one before a great while; and, in the meantime, the Western Union, it is to be hoped, will not repeat its former mistake of grinding down the salaries of its employés to the starvation point, even if there be, for the time, no opposition back door,

## An Essay on the Natural Enemies of the Telephone.

BY T. D. LOCKWOOD.

At the request of several persons actively engaged in the business of telephony, I have taken up this subject, though comparatively unprepared to give it consideration commensurate with its vital importance to every one who uses a telephone in any form or manner.

When some future historian of the world engages in the ever-increasing task of recording the vicissitudes, changes and progress of this self-sufficient planet, and, after reviewing the dark ages of antiquity, the classic age of Grecian domination, the iron age of the Roman republic, the Augustan age of the empire, and the semi-barbarism of the middle ages, arrives at the present era, he will have no difficulty in deciding that the proper designation wherewith to immortalize it will be "the electrical age."

For we employ the unseen, yet active, all-powerful and universal force, or agency, in almost every service that can be imagined.

If the school girl's definition of electricity, namely: "a force known only by its manifestations," be correct, as with some modifications it undoubtedly is, it must still be conceded that its manifestations are illimitable, and that the human race has accomplished great results in subduing so thoroughly what was, even until the present century, so untamable, wild and free.

We send our thoughts over land and sea; we speak to distant friends and correspondents without leaving the fireside; we light our gas instantaneously, without regard to the number of burners; we leave our banks and counting houses secure; watch our watchman; spread our fire alarms; explode our mines; regulate our clocks; light our streets and halls; keep one day ahead of the weather, and ring our domestic bells by the aid of the wonderful and mysterious force; and yet we do not know what it is!

Those who know it best regard it as a form of energy which causes the infinitesimal particles of matter to alter their positions in regard to one another.

The telephone, though not discovered until 1876, is based upon one of the best-known properties of electro-magnetism, namely, the fact that "when a spool of wire with a soft iron core is fixed on the pole of a permanent magnet, any alteration in the distance of an armature placed in front alters the magnetism of the core and sets up a current in the coil wound on the bobbin."

It is scarcely necessary at the present time to give a detailed description of the construction of the telephone, seeing that it has become, so to speak, a household word among the American people.

Suffice it to say, in explanation of its action, that the diaphragm of the telephone, when put in motion by the voice, vibrates, approaching and receding from the core, and, thereby, under the law quoted above, sets up currents in the wire of the spool, and consequently in the line wire to which it is connected; these currents pass along the line wire, and arriving at and passing through the coil of the distant telephone, act on its diaphragm, and set up vibrations exactly corresponding to those of the initial diaphragm, and thus reproduce the original sounds.

The currents caused by the very small movements of the diaphragm in front of the magnet are necessarily extremely feeble; so much so that the late Professor Pierce, of Boston, compared them to those which would be produced

by an electric source of which the electromotive force should be one two-hundred-thousandth part of the power of a Daniel cell. It is, therefore, evident that the apparatus which can be distinctly acted upon by such currents must be correspondingly delicate and sensitive.

We see, then, that the very sensibility on which the legitimate action of the telephone is so dependent becomes, under certain circumstances, positively detrimental, because it is thereby rendered equally subject to be influenced by very slight external or foreign currents; in fact by any extraneous causes which affect the electrical condition of the wire.

As an inevitable result of this extreme sensibility to external currents, which are usually stronger than the delicate magneto telephonic currents, the latter are to a certain extent, overpowered by the former, whether acquired from the earth, or by leakage or induction from other electrical conductors; and the manifestations of the foreign currents in the receiving instrument of the telephone wire are similar to those exhibited on their legitimate apparatus while the vocal transmission is correspondingly weakened. We will now consider and endeavor to classify the different disturbing sounds heard in the telephone, and then trace them to their several originating influences.

These may be arranged in five classes:

First: Frying, hissing and bubbling noises.

Secondly: Screaming and whistling noises.

Thirdly: Jerking and rasping noises.

Fourthly: Morse or other telegraphic communications in course of transmission on other wires.

Fifthly: Telephonic conversation, or vocal sounds in process of transmission on other wires.

Of course, the telephonic lines are also subject to interruption from other causes, such as breakage of wires, circuits accidentally left open, crosses, or contacts with other wires, and escapes, or grounds; but these troubles, being comparatively well understood, do not come within the scope of the present article.

The noises and disturbances of the first and second classes are, I conceive, almost totally due to earth currents, atmospheric electricity and thermo and hydro-electric reactions.

Earth currents are now known to be always traversing the wires. They affect lines running northeast and southwest most frequently, and vary with the time of day.

There is, likewise, always free electricity in the air and in the clouds, which acts on the earth and on the wires, they being generally conductors to earth.

These noises are much more intense by night than by day, on long lines reaching their maximum about 12 midnight, the disturbances of the second class becoming especially intolerable in the night.

M. Gressier, a French philosopher, accounts for these disturbances as follows:

During the day the current developed between the wires and earth-plates, on the one hand, and the earth itself on the other, the poles being the conducting medium between the two, are directed from the line to the earth, because the heat of the wire is greater than that of the earth, the currents being then thermo-electric."

During the night the wire becomes cooled, while the earth retains its heat; the currents then flow from earth-plate to line, and are hydro-electric. No line in which the earth forms a part of the circuit can be totally free from these disturbing influences; consequently, the only radical remedy for them is the use of a metal-

lic circuit. This being very expensive and inconvenient, it is well that disturbances due to the foregoing causes are not so violent as to interpose serious difficulties in the working of the lines, with the exception of very long ones, when the battery transmitter is employed.

We now proceed to the third class of interfering sounds—jerking and rasping noises.

These I regard as being chiefly attributable to defective joints in the line wires and loose connections in instruments. Such imperfect contacts set up true microphonic action, with its resultant sounds. The remedy for this class is obvious: More care in making and soldering joints, and more attention to the inspection of instruments and lines.

We now come to the disturbances which constitute the worst enemy of the telephone electrician, namely those which I have arranged in classes 4 and 5.

These are undoubtedly due to a variety of causes, the principal of which are leakage of currents from other wires; electro-dynamic induction and static and magnetic induction; those of the fifth class being also referable to the surcharging of insufficient and inefficient ground wires in central offices.

The first cause, leakage, is not exclusively an attendant on telephone lines, being likewise an old bugbear of all telegraph lines. Imperfect insulation allows the current to divide itself between all the wires on the pole, in proportion to their respective resistances; and as the shorter the wire the less the resistance, the tendency is to escape from a long circuit into a short one. When the current escapes to the earth, no great harm is done, as the only effect is to weaken the signals; but when it leaks into another wire, it confuses the signals on the second line. It is obvious, therefore, that the true remedy for this trouble is to convey the escaping currents to earth.

The plan recommended by Mr. Varley, many years since, and adopted on the English lines, is to attach a thick wire to the pole, coiling the earth end in a spiral under the foot of the pole, and letting the upper end of the wire project above the top of the pole, to serve as a lightning conductor. Wires are then attached to the under side of the cross-arms, and one end fastened firmly to the insulator pins, while the other end is firmly spliced and soldered to the thick wire running down the pole. The leaking currents thus find it easier to go to earth than to any other wire. As no insulation is absolutely perfect, this arrangement should be applied to all long lines. It is, of course, most effective when the earth wire is attached to every pole. The earth wires however, do more harm than good when they do not make a good earth connection; and it may here be stated that a buried plate to which the pole wire is soldered is the best earth. In some places the earth wires have been merely coiled a few times round the butt of the pole. Such a contrived earth has, on its resistance being measured, been found to vary from 2,100 to 6,000 ohms. It cannot, therefore, be commended. If good earth cannot be obtained in some places, an uninsulated wire may be run from pole to pole, connected to the earth wires on the cross-arms, and put to earth at convenient points.

This subject is fully canvassed in Culley's "Handbook," and Preece's "Telegraphy." The arrangement, though well known in England for many years, was patented by Mr. Varley in this country in 1868, and in a recent patent has been improved by the application of metallic sleeves, or sockets, in the cross-arms, to which the lateral

earth-wires are attached, and in which the insulator pins are inserted; also by running the uninsulated wire attached to all the ground wires throughout the whole length of the line. When well applied, the earth wires carry off a large percentage of the interfering currents.

Electro-dynamic induction is the next cause, and, after leakage, is the most troublesome. It is very difficult to render in a clear manner, to persons unacquainted with electrical phenomena, the idea expressed by the word induction. The majority of those actively engaged in the telephone business, it is well-known, are not practical electricians, and for this reason the word induction, spoken and written of a few times in reference to telephonic disturbances, has been eagerly snapped up and applied indiscriminately to all kinds of such disturbances. It is, however, a well-defined term; has a well-defined meaning, and well-defined laws. It was thoroughly studied by Faraday, who made public his experiments with their results. Induction, briefly expressed, is the name given to electrical or magnetic effects produced in bodies to which the exciting cause is not directly applied.

Dynamic induction is the power which a current in motion has, when flowing in a conductor, of inducing currents in neighboring conductors. The most obvious remedy for troubles originating from this cause is the employment of a return wire, parallel and near to the first, instead of an earth return. Under such conditions, the currents induced on one wire would be neutralized by those resulting from the same induction on the second wire, which would then act in an opposite direction. This, however, would only be efficient when the wires were near each other, and both equally near to the disturbing wire. This idea was early proposed by several persons.

Another idea was broached by Mr. Preece, in a lecture before the Royal Society in 1877, which I am disposed to regard as effective.

It applies both to static and dynamic induction. Static induction, it may here be well to explain, is that influence which an electrified body has on all conducting bodies in its immediate vicinity.

Mr. Preece's proposed remedy was to interpose between the telephone wire and the other wires a conducting body in communication with the earth, and capable of acting as a screen to the induction, by itself absorbing the electro-static effects. He suggests a practical application, in the employment of insulated wires covered with an iron or metallic case, the case being in direct communication with the earth. It is my impression that the outside conductor, even if unconnected with the earth, would very much counteract the dynamic induction, by setting up a counter induced current to that of the inducing wire, and also by absorbing into its greater substance the currents which would otherwise be divided among the other wires on the same poles. The earth connections, I think, effectually dispose of the static induction, on the principle quoted by Jenkin, in his valuable work on electricity, in which he states, as a well-known fact, that if an uninsulated metal plate be interposed between an electrified body and an insulated body, all inductive effects cease, but if the metallic plate be insulated it has no such effect.

To the best of my knowledge, this remedy, of insulating the conductors and then surrounding them with a conducting medium in connection with the earth, has never been applied to pole lines, chiefly on account of the expense. It has,

however, been applied to conductors, when grouped together into a cable, and gives satisfactory results.

First recommended, so far as the telephonic application is concerned, by Preece, it was, in 1877, tried on the Post-office telegraph lines in England. Subsequently it was applied to telephone lines by C. E. Chinnock, of New York, an American inventor. It was then discovered that a French physician had laid down the principle, applied it to telegraph cables in 1869, and patented the cable.

This cable is made substantially on the plan spoken of by Preece, and works well. Subsequent experiments lead to the belief that if conductors are grouped together, well insulated, and the whole inclosed in a metallic tube, inductional troubles will be practically obliterated. In any case, the greater the number of wires the less the disturbance, as the foreign currents must divide in direct proportion to the number of wires, other things being equal.

A paragraph has recently gone the rounds of the newspapers, to the effect that a firm of Swiss wire manufacturers have discovered a new process and material for the manufacture of cables which totally prevent inductional effects. No details, however, are as yet given.

Magnetic induction between wires conveying currents, though present, does not, I am convinced, interfere to an appreciable extent with telephonic transmission. It may, therefore, be ignored in the present article.

As regards the size of line wire, it is rather unfortunate that two obnoxious forces, leakage and induction, are at swords' points, leakage being lessened by the use of larger conductors, and induction correspondingly increased, and consequently diminished by the use of smaller ones. No remedy for this is at present discernable.

Lastly, I am firmly persuaded that much of the interference between wires centering in the same office, arises from the fact that far too many wires are worked from the same earth terminal, and that often none too reliable. I am in favor of multiplying ground wires at central offices, of using larger ground wires, and of insisting on more care in their attachments. Too much stress cannot be laid on this point.

The problem of long line telephony is rapidly yielding to the energy and thought that have been applied to it, and will, no doubt, soon be solved. When it is done, we shall probably be surprised to see how easily it was accomplished. To my mind, the chief obstacle is *poor insulation*; and I conclude by saying: Take more care to use good ground wires; use proper earth wires and their connections on poles, and, above all, *improve insulation* in every possible way.

#### The Metropolitan Press on the Consolidation.

[From the Herald of Jan. 14.]

Whether business is meant or not, or whether the talked of consolidation is merely a job "put up" for speculative purposes, is a matter of considerable doubt. The parties who have thimble-rigged the street so effectively are quite capable of abandoning the whole project (which looks so certain to-day), provided they can market their long stock at a satisfactory profit and get comfortably short at high prices. Supposing, however, that the consolidation is meant to be carried out in good faith, what sort of inducements are offered to investors in the new company? It is stated that the combined companies of Western Union, American Union, and Atlantic and Pacific are to be merged into a joint stock company, representing \$80,000,000, and upon this amount satis-

factory dividends are expected to be paid. Western Union, by its last report, showed its inability to earn little or nothing over and above expenses, and consequently the onus of the dividends rests upon the other two companies. That these can pay a decent dividend upon their own proportion of capital and have enough left to help Western Union out of the scrape is simply preposterous. The proposed capitalization is more preposterous still. Western Union, costing \$41,000,000, can be repeated for \$15,000,000. American Union, which is to be capitalized at \$15,000,000, has cost about \$4,000,000, and Atlantic and Pacific some unknown number of dollars that will scarcely exceed the latter figures. In short, the public is invited to buy into a property which is nominally worth \$80,000,000, and is actually worth not more than \$30,000,000. Beyond the rascality which lies behind the whole of this Western Union movement, regarding its speculative way, lies the fact that the public are ultimately to be made to pay for it in the establishment of a close monopoly, higher rates for messages, and the usual tyranny which follows the beck and nod of imperial control.

[Daily American Exchange, Jan. 14.]

Regarding the telegraph situation little can be added to what we have already published. The facts in the case are these: W. B. Somerville, superintendent of the Press Bureau of the Western Union Telegraph Company, has stated that Dr. Norvin Green, president of the company, authorized him to say that it had been agreed to consolidate the competing telegraph companies. Details of the terms of the consolidation are withheld until the directors of the Western Union pass upon them. Every officer and director of the Western Union, the American Union and the Atlantic and Pacific telegraph companies refuses to be interviewed on the subject. It is left to the public to guess whether the terms published in some of the morning newspapers, without the mention of a single tangible authority, are correct. It is left to the public to wait for the truth until the directors of the three companies have approved any compact reported to be agreed upon; and until the stockholders of the three companies have formally ratified the action of the directors. We say it is left to the public to wait, but there are some of its members who may be cajoled into buying at high prices the Western Union stock which the controlling spirits in the consolidation scheme may—possibly may—wish to give them.

"That man has not profited by the experience of the past who will believe that the Western Union and the American Union telegraph companies are to be consolidated or united in any way until the final step necessary to that end has been taken and fully made public." The Pennsylvania Railroad Company has a contract with the American Union under which the latter yields the former a handsome sum for its use of the Pennsylvania telegraph lines; is the "consolidated company" to accept this contract and terminate the pending legal litigation by which the Western Union recently hoped to obtain something for nothing? The Baltimore & Ohio Railroad Company has extensive telegraph lines, from which it dismissed the Western Union some time ago; is the reported monopoly to inherit the favors of a corporation which has never submitted to the monopoly's domination except when helpless? A month from now the public will learn whether the reported consolidation is genuine or is a child conceived in dishonesty and born in the debauchery of stock jobbery. But there is one lesson to be drawn from the transaction, no matter how it terminates. The public need not look for a permanent opposition to monopoly from men who are ready to sell their friends' souls for the sake of their own pockets.

[From Truth, Jan. 14.]

As a leading broker said to a *Truth* reporter: "There are millions in this scheme, and they are to be made by the few within whose circle the secret can be kept. The longer the state of uncertainty can be sustained the better it will be for them. I have no opinion to express, as it is a matter of business to me."

An opinion is expressed, however, that in spite

of the assurances of the officers that the amalgamation is decided upon, and will be immediately settled, the controlling interests will manage to raise serious obstacles, only to be cleared away when the consequent depressions shall have been taken due advantage of.

Mr. Jay Gould, when the American Union was projected, expressed his belief in the reduction of rates to the lowest practical limit, as the best means of increasing the profits of a company.

His war with the Vanderbilt interest in the Western Union has compelled a resort to that policy, but the entire monopoly will most probably result in an increase of rates, that the litigation between the two companies may be paid for by the public during that period within which there can be no relief. When the public becomes aroused to a proper pitch of indignation, another company will then be projected, and the Goulds, Vanderbilts, Sages, Eckerts, will once more reap a golden harvest.

It is beyond speculation that a large number of offices could be closed with advantage to the combined companies, and materially reduce expenses. This, of course, means not only that numbers of employes will be dismissed, but that the great supply will enable the limited demand to select those who will work at the lowest prices. While Mr. Gould will make \$5,000,000 by the transaction, some hundreds of clerks will be thrown out of employment, and hundreds more retained at a point just above starvation wages. But that is the usual "divvy" in such cases.

It is said that Mr. Gould has a more subtle scheme behind this amalgamation. It would not be a bad stroke of business, after having consolidated, to prevail upon the Government to purchase the entire system at a price which should be satisfactory to the sellers. Mr. Gould is alleged to have expressed his intention of withdrawing from telegraph matters—a statement which may be taken for what it is worth.

[Times, Jan. 14.]

The consolidation is but another step in the process of building up a vast monopoly in the hands of a few great capitalists. In 1858 the capital of the Western Union Telegraph Company was \$385,700. Eight years later it had expanded to \$22,000,000. Of this, \$3,322,000 had been issued for the purchase of competing lines, but nearly \$18,000,000 was put out in the form of stock dividends. It constituted, in fact, an enormous injection of water into the capital, and the shares were not worth twenty five cents on the dollar in the market. The next step taken was to buy up the United States Company, for which \$7,216,300 more of stock was issued, which is believed to be five times the value of the property acquired. Then followed the absorption of the American Company. Its stock, which was also enormously inflated, amounted to \$3,833,100, but \$11,833,100 more of Western Union stock was launched in securing the line. This brought the nominal capital up to about \$41,000,000, upon which the public has been providing the means for payment of an 8 per cent dividend.

After the Western Union Telegraph Company had attained this enormous growth, and apparently established itself as a monopoly in the business of transmitting messages by electricity, Mr. Jay Gould began his periodical raids upon it for the purpose of speculative gains and an ultimate share in the monopoly. His method has been to start a rival company, cut rates, and bear Western Union stock, and then open negotiations for a combination. \* \* \*

The unchecked growth of this huge monopoly thus far is a sufficiently startling phenomenon, but we have no assurance that its ultimate dimensions and its full power will have been attained when Mr. Vanderbilt, Mr. Gould, and their associates, have completed the bargain which is now on foot. There is nothing to prevent a repetition of the processes of the past, so long as the public will submit to any taxation which these daring operators may see fit to put upon it for their own enrichment. The operations which we have briefly sketched are attended with a merciless fleecing of small speculators, and the final result is a gigantic monopoly, against whose exactions the public has no protection.

### Fighting Continued Until Consolidation Came.

About three months and a half ago, the Pennsylvania Railroad (in the name of its leased lines) notified the Western Union Telegraph Company that, on and after the 6th of January, it was their intention to terminate all existing contracts with the Western Union (this period of time being deemed a sufficient notification, under the contract); and that, after January 6, the Pennsylvania Railroad would be willing to enter into a new contract "upon terms deemed by the Pennsylvania Railroad equitable and fair"—presumably, the same terms as are now enjoyed by the American Union Company.

Previously to this, the American Union Company had contracted with the Pennsylvania Railroad for the privilege of erecting poles and placing wires thereon along the wires controlled by the latter company, the consideration being two million dollars for twenty years, or an annual rental of \$100,000. Heretofore, the Western Union has been operating the same lines, in New Jersey, upon thirty-year-old contracts, between the American Telegraph Co., the Magnetic Telegraph Co., and the Camden & Amboy Railroad and other companies, to whom the Western Union & Pennsylvania Railroad respectively succeeded. The Western Union maintains that these agreements—the first of which is dated October 17, 1846—still hold good, a position which is disputed by the Pennsylvania Railroad.

To settle the matter the case was, on the 4th inst., carried before the United States Court, in Philadelphia. Preliminary argument was had, but the case was postponed until Monday next (17th inst.), when a final decision will probably be reached.

As, by the Pennsylvania Railroad's notice, the contract with the Western Union expired on the 6th inst., and as it was understood that after that date the railroad company intended to throw off the Western Union wires from its poles, the Court granted a preliminary injunction, restraining the railroad company from further action until the case can be fully heard on Monday next.

Meanwhile, impatient of the law's delay, the Western Union and American Union have renewed the "war" of a year or so ago in New Jersey, a number of the poles of the latter company being cut down, and several employes of both the Western Union and American Union being arrested and held to bail for interfering with each other's lines. Now, that the consolidation has been effected, however, we have probably heard the last of these "wars" until the next opposition company comes along.

A gentleman, whose prominent position with the Western Union makes him well informed on all matters of this character, in a private note to us says:

The trouble at Rahway was caused by the A. U. setting extremely big poles right by the side of ours, and between our wires. They were so large that our wires touched the sides of the poles. Then the constant stringing and changing of A. U. wires, with their arms above ours, you can imagine the trouble it would be to us. These poles—quite a number of them—are on private property, the owner of which leases the right of way to the W. U., but not to the A. U.: so they were trespassers, and the owner requested the W. U. men to chop them (the A. U. poles) down. They got one down when the A. U. men, who were on guard with a warrant, had the W. U. men arrested. The trouble on the P. R. R. amounts to just this: the road has, by squeezing the A. U., got a fat thing out of them in leasing the right of way, and now it wants to get the same money (proportionably) out of the W. U., but the latter demurs. There is no doubting the fact that the A. U. folks pay all these railroads an extremely large sum of money for their privileges—all they will ever be able to get out of them. The A. U. is being used as nuts by these R. R. folks, who have always been unmercifully squeezed by the W. U., and are now trying to inaugurate a change.

### A Commendable, but Exceedingly Tardy Effort to Make Amends for a Cruel Blunder.

John George Boyce died November 15, 1877, of colliquative diarrhoea. This was sworn to at the time by his attendant physician. Some self-important and absurd creature undertook to prove that Boyce died of "consumption," and succeeded so well that he saved the dollar which would otherwise have been charged him as an assessment. So the case went on for three years until the *Magnet*, last summer, injected new life into the subject. Since then THE OPERATOR, knowing a thing or two about the stupid manner in which the thing was "managed," has had something to say with regard to it. Three years is a long delay, but we believe that it is better late than never, and therefore hail with much delight the following notice, which is being sent to all members of the T. M. B. A.:

"John G. Boyce, a member of the Telegraphers' Mutual Benefit Association; certificate No. 2,052, was issued Oct. 6, 1876; died at Lake City, Florida, Nov. 15, 1877.

"When application was made by his heirs for the amount due in the case, information came to the secretary which induced the presumption that incorrect statements had been made by the deceased as to the condition of his health at the time of his application for membership, at which time, it was asserted, he was consumptive and must have known it. So strongly was this urged that, on the vote being taken on the acknowledgement of the claim, five members of the executive committee voted against and four in favor of its payment. The claim was therefore rejected. An appeal to the annual meeting of 1878 led to a like decision, and by that action, which took the case beyond any further action of the executive committee, reconsideration of the claim has been debarred.

"So much feeling has grown out of this decision; the friends of the deceased, including many members of the association and the agent, strongly resenting the imputation of fraud; and in view of the closeness of the vote by which the claim was rejected, a movement was inaugurated at the close of your last annual meeting to relieve the widow and orphaned family of Mr. Boyce, who are in very destitute circumstances, by an appeal to the members for a voluntary subscription for their benefit. This practically leaves the settlement of the case to the members, and already many have responded generously to the fund. The opportunity is now given to all to participate therein, and to which I have been authorized to invite you; any amounts subscribed thereto to be forwarded through the agents as usual as in the case of regular assessments.

"If you desire to contribute to this fund, please remit such additional amount in connection with your next assessment, filling up the accompanying special blank for that purpose.

"The amount received from each agency for this fund will be acknowledged in the *Journal of the Telegraph*, and a statement made of its payment to the beneficiary.

"By order of the executive committee,

"J. N. ASHLEY, Secretary.

"NEW YORK, Jan. 1, 1881."

### The American Cable Company.

Our English cousins appear to be very much exercised over the fact that "the Americans" have presumed to undertake to lay Atlantic cables of their own; and that "the Americans" have shown a disposition to give the existing English and French companies the go-by—whatever that is. The fact that the old Anglo-American—the sixty-six cable, and the sixty that, and the sixty other—the Direct cable, and the New French Company, have never yet paid enough dividends to Mr. John Pender and others, seems to give our cousins a great deal of anxiety about the financial prospects of two new "American" cables. Hitherto, Mr. Pender's idea of an "international cable" has been one where

all the profits of ocean telegraphic traffic must necessarily flow into the pocket of John Pender. Anything outside of this is really astonishing to Mr. Pender. Still, we see no reason, Mr. Pender's patriotic views notwithstanding, why "the Americans" should not put to the test their theory that competition is the life of trade; and, by laying costly but efficient cables at their own expense, further astonish Johnny Bull by making handsome profits in a field—or ocean—where he has signally failed.

A special dispatch from London says that the news of the consolidation of the American Union and Western Union Companies has been received with comparative indifference in the London stock market, where little or none of the stock of either company is held, and is discussed only in so far as it is thought likely to effect the new American cable enterprise. Inquiry shows that it has evidently strengthened that enterprise, as General Eckert, the present President both of the American Union and of the Cable Company, will take the general management of the entire consolidated telegraph company, and that the American Cable Company, under his supervision, will probably extend the scope of its enterprises across the Pacific to Japan and China. The Messrs. Siemens are working night and day on the cables ordered for the Atlantic service, and they will be ready earlier than was anticipated. The construction of the core and the armor for the new American cables will make them the finest, beyond all doubt, yet laid.

### A Well-Deserved Compliment to Superintendent Brenner.

On Christmas eve, Mr. J. A. Brenner, Superintendent of the Third District of the Western Union Telegraph Company, while about to take his departure for Atlanta, was presented by Mr. J. M. Crowley, Manager of the Augusta office, with a magnificent silver testimonial in behalf of the employees of the Third District of the Western Union Telegraph Company and Telephone Company. The silver service consists of a solid silver tray, with coffee, tea and chocolate urns, sugar dish, butter dish, syrup stand, cream pitcher, slop bowl and two cake baskets, the latter being filled with the cards of the donors. On the tray, beautifully engraved, were these words: "Presented to J. A. Brenner, Superintendent, by the Employees of the Third District, December 25th, 1880." The other articles are each engraved with the letter "B."

Mr. J. M. Crowley, manager of the Augusta office, made the presentation address, and Mr. Brenner returned thanks in a neat off-hand speech.

The idea of the surprise was a good one, and its execution was perfect. The operators throughout the district, from Wilmington to Jacksonville, in 126 offices in the States of North and South Carolina, Georgia, Florida and Alabama, all combined in heart and pocket toward the bestowal of a Christmas present handsome enough to show their regard for Superintendent Brenner. Especial mention must be made of the lady operators, who were particularly generous in good wishes and their contributions. Autographs of all the contributors, amounting to nearly 200, rest in the baskets of the service.

The testimonial itself is one of the handsomest silver services ever gotten up. Solid silver, most elegantly engraved and frosted, with beautiful gold lining, the appearance of the service is strikingly handsome, and will constitute a lasting and imperishable memorial of the love and respect of friends and employees for a worthy and deserving man.

### The P. R. R. Suits.

The difference of opinion in this case is whether or not there is any binding contract in existence giving the Western Union exclusive rights or privileges on railroads controlled by the Pennsylvania Railroad Company, and lying within the State of New Jersey.

The merits of the case are so much involved that we can express no opinion in the matter, but prefer to wait and adopt the views of the court. One thing, at least, is certain, and that is, that the Pennsylvania Railroad had no intention of throwing off Western Union lines so as to turn the business into the hands of the American Union; it merely desired to collect the same rental from the Western Union, for similar privileges as it already obtains from other companies. The fact is that railroad companies which, years ago, accorded a certain privileges to telegraph companies on easy terms, have suddenly awakened to the fact that telegraphing has become an exceedingly profitable business, and one for which railroads can safely demand higher rents. The Western Union resolves to "pay no rent," and was, in accordance with the new order of things "Boycotted" by the railroad companies. It is understood that as fast as Western Union contracts expire with other railroads, a notice to remove their wires will be served, though the consolidation may make some difference in this respect, as in others.

### Let the Good Work Go On.

In response to a call issued in THE OPERATOR, to aid the widow of the late John G. Boyce, a subscription was started in Columbus, Ohio, the following gentlemen giving the amount set opposite their names, which has been forwarded to J. N. Ashley, New York:

WESTERN UNION.			
Geo. W. Irwin.....	\$0.50	Chas. Colwell.....	\$0.50

### Instructive as well as Entertaining.

"Telegraphic Tales and Telegraphic History," by W. J. Johnston, is a popular account of the electric telegraph, its history and the growth of our modern telegraph system, together with a great variety of authentic, illustrative anecdotes and stories relating to the telegraph and its uses. The book is an instructive as well as an entertaining one, very prettily made, and carefully edited by Mr. Henry G. Taylor, a New York journalist to whose skilled judgment and good taste the author pays a warm tribute in his preface.—*N. Y. Post*.

The dispute between the great philosophers of the telegraph as to the merits of wooden as against iron poles for city lines, reminds us of Sydney Smith's reply when his opinion was asked about the wooden pavement around St. Paul's. Wood is undoubtedly the better and cheaper material for the use of our managers; for, as Sydney Smith said, "Let the canons lay their heads together, and the thing will be done."

A Holtz machine, which can produce a 26-inch spark, has just been made in this city. The revolving plates are 45 inches in diameter. The *Scientific American* thinks it probable that this apparatus is the largest electrical machine of the kind ever constructed.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, JANUARY 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the *old* as well as the new address.

### THERE SHALL BE ONE FOLD AND ONE SHEPHERD.

Once more the scratching of an astute financier's pen has shaken the foundation of the monetary circles of a whole continent. In our news columns to-day we announce with much regret the preliminaries of a tripartite agreement which seems to virtually put an end to telegraphic competition in America; and, owing to the right of way and multiplicity of contracts held by the existing companies, secures for the new monopoly an almost invulnerable position. The Western Union Telegraph Company, organized nearly 33 years ago, with a capital stock of only \$36,000, and which was marketed in 1861 for 30 cents, and its great rival, the American Union, which has not been open for business one year, have joined hands in forming, in conjunction with the Atlantic and Pacific Company, a monopoly unequalled in the annals of telegraphy.

We are disappointed in the action of the American Union Company, for the bottom has fallen out of it much more rapidly than its rosy promises led us to believe. It came to us and the public at large as the apostle of a new era in telegraphy. Its officers avowed, time and again, and we believed them, that consolidation was impossible. Its great battle cry was "Death to Monopoly," and its circulars and other advertisements teemed with announcements to that effect, and protestations of its fidelity to the public. One of its circulars concluded as follows: "We rely upon such patronage as will be profitable to the company, and emancipate the public from the exactions of a monopoly." Our respect for the reputation of human nature in general deters us from inquiring too closely as to the reason for this dissimulation.

Still, there is no reason why a monopoly, wisely and honestly managed, should not be as satisfactory to the public as the liveliest kind of competition; and, while we regret that opposition should have been so completely wiped out, we cannot but congratulate the newly-formed monopoly upon the auspiciousness of its commencement, notwithstanding that it thus adds ten millions of dollars to the aggregated capital without in any way increasing its telegraphic facilities.

The new combination will have a Sisyphean job in rooting out the dry-rot which has hitherto been the great drawback to success in telegraphy; and in commencing the reforms in the details of telegraphic management which are so palpably needed. In this respect it cannot do

better than adopt the policy laid down by the late American Union Company—if it is not too soon to say "the late"—a company which though barely a year old, has lived long enough to point out, if not to demonstrate, what *can* be done.

In one year it has—though by false pretences, as it would seem now—monopolized all that is shrewd and talented in telegraphic life, and has secured the best operators, as a rule, while, at the same time, it has done all that science and skill, properly remunerated, could do. Its worthy president set an aim for telegraphers, excellence, and, his subordinates becoming attuned to that single aim, and closely allied to each other, it resulted in a most effective and brilliant service. If the new company will now take up the lines of discipline and management where the American Union leaves off, they will meet with assured success.

It has not yet been announced who is to manage the new combination. Some of the newspapers speak of Mr. Gould for president, and General Eckert for first vice-president and general manager, but this is probably merely guesswork so far as the first is concerned. As regards General Eckert, it is doubtless correct.

However, in the light of past experience, and the limited number of persons to whom the selection must be restricted, the right man will not be hard to find. He must necessarily become the centre of many concentric circles, and will wield a powerful influence.

For operators the outlook is, we regret exceedingly to say, less bright than before. Two main offices will, on account of the heavy business, be maintained in this city, but a great number of competing offices will be closed in all the large cities throughout the Union. This will bring hardship to many a hard-working operator, but we must bow to the inevitable. We trust, however, that the various managers will make their selections judiciously, remembering those who have been faithful heretofore, and making the changes in such a delicate manner as to produce the least possible hardship. It is a fitting time, also, for the operators to show their good fellowship by helping the victims in every possible manner; and, by standing shoulder to shoulder in misfortune, prove that they can do so when other changes may require concerted action.

Now that the claims of Mrs. John G. Boyce have been revived, after three years of official inactivity, and a circular has been officially issued requesting payment of the claim, we hope to see it settled at once. But this is certainly the wrong way to do it, although it is better than the stupid policy pursued before Mr. Ashley took hold. The money should be paid, with interest, by regular assessment from the funds of the Telegraphers' Mutual Benefit Association; and, while we shall be glad to have it paid now by voluntary contributions, we hope in the future to see one regular assessment omitted, in return, and paid from the accumulated fund. We believe that if ever a widow had a good claim on an insurance policy, Mrs. Boyce has one; and we shall be glad, considering it a Christian duty, to surrender the space necessary to prove this, and to convince every one that all the brains in the telegraph business are not located in "official" heads. On the very day of Boyce's death, and immediately after hearing of that event, a leading official pounced upon the mare's nest. On that very day—the same day that Boyce died—although that official was a thousand miles from the scene, he wrote that "this thing looks

crooked;" and added, in alarm, "this is the third death in one month," intimating in an inferential way that such reprehensible conduct as dying at the rate of three a month on the part of operators, must be stamped out. From that day forward that man devoted what he believes to be his mind toward proving that it was "crooked." The usual set of petty understrappers attuned their instrument immediately, and for a whole year played second fiddle so effectually that better men were deceived, and the friendless widow was cruelly wronged. One irresponsible party wrote that Boyce "evidently had consumption;" another gravely asserted that Boyce "coughed a good deal;" every unthinking Tom, Dick and Harry had his theory; the sum total of it all being the apparent indorsement by an organization of honorable men of an act of official meanness that would, if properly explained, shame a Down-east Jew peddler. But, far and above all these dollar saving and extraneous opinions stood the *sworn record* of the attending physician, which proved as plain as daylight at a midsummer noon that Boyce did not die of consumption. We will leave for another occasion a denunciation of the incomparable avarice which prompted these same men to collect and retain two dollars, in assessments, from the almost penniless widow, *after Boyce had died*. We are in earnest in this matter, because it is likely to strike any one of us. Nothing comes nearer home to us than breaking faith with a fellow-worker after he dies, and depriving his children of the benefits of his thrift in life; and we hope that every member of the Telegraphers' Mutual Benefit Association, who belonged to that organization when Boyce died, Nov. 15, 1877, will now remit his dollar as promptly and cheerfully as though the assessment had been issued in the usual way. The principle must be established that, when you die, if there is doubt of any kind, the benefit of that doubt must be given to your sorrowing widow and the little fatherless curly-heads that are left behind.

We hope ultimately to see this same assessment paid from the reserve fund, thus relieving those who subscribe now from the payment of some future assessment.

THE Atlanta, Ga., *News* well describes Superintendent Brenner, of the Third Western Union District, as "one of the best and biggest-hearted men in the world." We have always believed that, and rejoice to see that the employés of the Third District recognized it in an appropriate manner on Christmas eve, a pleasant episode, which is cheerfully reported in another column. But there is one stain on that district which we have always hoped to see effaced. It was in the Third Western Union District—among Southerners—that John G. Boyce, a friendless Northern boy, died. They were officials of the Western Union Third District who asserted that John G. Boyce died of consumption, and thereby deprived his widow and orphans in the North of the amount of his insurance, notwithstanding that his attendant physician (a Southern man, too), *swore* that Boyce died of an entirely different disease; notwithstanding that Boyce never had a regular doctor in his life until he accepted night work in Florida; that up to within five days of his death he worked regularly the heaviest wire in the South, and that he had been an accepted member of the Telegraphers' Mutual Benefit Association and had paid his regular assessments for fifteen months. Superin-

tendent Brenner had no hand in that peculiarly heartless fraud; and, for that reason, in addition to our appreciation of his sterling merits as an executive officer, we rejoice to see him honored.

SINCE our last issue, we have been taken severely to task for asserting that we have "no opinions" to thrust upon others. We still maintain that it is not the function of THE OPERATOR to do the thinking, but only to give expression to the thoughts of the profession, and to stimulate its members to deep thought. We are aware that some men swear by what they see in print; that "the press is a powerful forming influence, pressing on men from every side," and all that kind of moralizing, but we have no desire to take advantage of any such weakness in human nature. Therefore, opinions expressed by us are not strictly our own opinions, but the thoughts and aspirations of the profession, reflected in our columns. When we fail to reflect those opinions correctly, there is a financial barometer which apprises us of that fact quicker than our esteemed critics can tell us; for, while no man can dictate to another what he shall write, every man can determine for himself what he shall read, and your wide-awake son of freedom will no more subscribe to an unworthy paper than he will associate with a disagreeable companion—for a good journal is a companion.

THE anniversary of the birth of Benjamin Franklin (Jan. 17, 1706) occurs the day after tomorrow. Born in the first decade, and ending his notable life in the last decade of the eighteenth century (April 17, 1790), his character will never cease to have a peculiar fascination for American telegraphers in particular, and scientists all over the world in general. Born in poverty, at a time when our peculiar science was just groping its way out of the darkness of centuries, "Poor Richard's" doings are matters of familiar history to all. For our benefit, he transmitted, in 1748, an electric spark across the Schuylkill River, at Philadelphia; and, June 15, 1752, demonstrated, in Philadelphia, a theory suggested by him years before, that lightning and electricity were the same, by drawing lightning from the clouds by means of a kite. Of his services to the new-born Republic, and as a statesman, it would be idle to speak, and we can only contemplate, with Byron, his noble character:

"While Franklin's quiet memory climbs to heaven,  
Calming the lightning which he thence hath riven,  
Or drawing from the no less kindred earth,  
Freedom and Peace to that which boasts his birth."

AT the recent destruction of the wall paper manufactory of M. H. Birge & Sons, in Buffalo, and the burning of ten employes, a little lad of 17, Patrick Tierney, assisted eighteen companions to escape from the fifth story, by means of a telephone wire, while another boy leaped from the fourth story to a pole-line below, the wires of which breaking let him down in safety to the ground. We commend these two incidents to the attention of those who object to telephone and telegraph wires as nuisances which should be placed underground or above the clouds. In these days of high buildings and selfish proprietors, who refuse to obey the laws of decency, and to provide suitable fire escapes, these "nuisances" may become of the utmost value as means of safe descent from burning buildings.

SOME of our advertisers request us to ask those writing them for catalogues, information, or

the like, to always write their full name and address distinctly. They say they receive inquiries which it is impossible to answer, on account of the indistinct manner in which the name has been written, or the omission of the State, and sometimes of the entire address. We, ourselves, are often caused much annoyance, or extra work, from this same cause. In writing on business matters, always give your name and full address plainly every time, and if prices have been quoted repeat them, and repeat the name of the article and all about it when you order. This will prevent the necessity of referring to your former correspondence.

As the telegraph authorities decline to be loquacious on the subject of the consolidation, our esteemed contemporaries of the country at large get terribly muddled in discussing affairs telegraphic. We find by a cursory glance over a host of exchanges that Dr. Norvin, Vanderbilt, President Jay Green and William H. Gould engineered the American Pacific Company's case, while the Union Atlantic Company boasted of the services of such giants as General Thomas T. Cornell, Alonzo B. Eckert and David Homer Twombly. Hamilton McKay Bates looked after the interests of the Western Rapid. There's nothing like being in the ring to get correct information about these affairs.

COMPLAINTS from all quarters are coming in concerning certain telegraph managers and operators making schools of their offices for the instruction of students, and turning an occasional penny in other ways connected therewith, while drawing salaries from the companies. For their benefit we quote the following extract from Western Union Order No. 171, dated New York, Oct. 30, 1877: "No employé of the company should engage in any other business, or accept any other employment without previously receiving the written consent of his respective district and general superintendent."

That order is only three years old, but it appears to have been frequently overlooked.

FORTY-THREE years ago (Jan. 24, 1838), the first telegraphic message by means of the dot and dash symbols—Professor Morse's alphabet, invented by Alfred Vail—was sent over ten miles of wire, in this city. On the following day, the *Journal of Commerce*, in speaking of the innovation, said: "Professor Morse has recently improved on his mode of marking, by which he can dispense altogether with the telegraphic dictionary, using letters instead of numbers; and he can transmit ten words per minute, which is more than double the number which can be transmitted by means of the dictionary." Things must have changed somewhat in the past 43 years.

It may interest some of our manufacturers of electrical supplies to know that a government monopoly can shut up their establishments with as little compunction of conscience as it can shut down on the hopes of shareholders who have invested their savings in seemingly paying private companies. Mr. Fawcett, the Postmaster General of England, has now discovered that the government can effect a saving by manufacturing its own instruments, in addition to monopolizing the telegraph. Shops have accordingly been established by the government, and henceforth "the Crown" will make its own telegraphic instruments.

THE French government has asked the Chamber for a grant of 300,000 francs to cover the expenses of the Congress of Electricians and the Exhibition of Electrical Apparatus, which will be held, next autumn, at the Palais de l'Industrie, Paris; and of which the readers of THE OPERATOR have already been fully informed. The Prince of Wales, who, like his illustrious father, the Prince Consort, delights to assist in the advancement of science, has been spoken of as the probable President of the Congress.

AN able and timely article on the Natural Enemies of the Telephone, by Mr. T. D. Lockwood, is published in this issue. In it our telephone friends will find much practical information on a most important subject, which has not hitherto been touched upon by any of our electricians. We are compelled to postpone Mr. Lockwood's usual installment of "Notes and Queries" until next issue, on account of the length of this special article.

A NEW journal, devoted to the subject of all kinds of instruments where great precision is required, was commenced in Berlin on the 1st inst., with the somewhat uneuphonious name of the *Zeitschrift für Instrumentenkunde*. It is controlled by a board of twenty-one editors, representing all the different branches of science. We wish the *Zeitschrift für Instrumentenkunde* much good luck.

OUR sympathies are extended to Mr. W. B. Clum, of the A. and P. Co., upon the untimely death of his eldest son, an exceedingly promising young man. Mr. Clum lost his wife about two years ago, his youngest child about a year ago, and now we are called upon to chronicle the death of his son.

THE Volta Prize, which was awarded by the French Academy, last September, to Professor A. Graham Bell, is 50,000 francs. It was originated by Napoleon I. for improvements in electrical apparatus, and has previously been awarded to but one person—Ruhmkorff, in 1848.

APPLICATIONS for space at the International Exhibition of Electricity, to be held in Paris, next autumn, will be received until March 31. No charge will be made for space, but those who will require steam-power must pay some fixed rate.

THE consolidation will demand the closing of a good many superfluous offices in about six weeks from now, and that action will create a number of wandering refugees. There is pith in the prediction, "Beware the Ides of March."

THE unfortunate operator who bulled the report of a congressional caucus so as to make it appear that they had a circus, was not, in the light of recent events, so very far astray in his instinct.

WHAT is the use of naming the new combination "Western Union?" As the last hope of opposition has fled for some time, why not call it "The Telegraph Company?"

WESTERN UNION stock is quoted at 110½, American Union at 90, and A. & P. at 47. Last issues were 78½, 71¼ and 34., respectively.

THE lamb has once more laid down inside the lion.

## Chicago Notes.

To the Editor of *The Operator*:

Sir: There have been but few changes here since last writing. One, however, has occurred which deserves particular mention. Mr. Robert H. Lord has gone to join his brother in the railroad business in Galveston, Texas, where he hopes by industry to place himself more speedily in the way of promotion and advancement. A hope and condition that few operators can rely upon with any flattering degree of confidence in the telegraph business, no matter how decided their ability, or how persistent their efforts. Mr. Lord has been employed here for the past five years; during the last year in taking the reports of the Western Associated Press from New York. He is one of the few equal to the task of manifold to the number of nine or ten copies and "putting it down" in a uniformly plain and beautiful hand-writing, never omitting the necessary punctuations. The W. U. Co. lose a very valuable operator, and the city printers will doubtless regret his absence. Mr. Lord is a gentleman of pleasing manners and excellent character. His Chicago co-laborers unite in wishing him unmeasured success, and commend him to the good-will and friendship of all with whom he may come in contact in his new field of operations. Mr. L. M. Smith has taken his place here as report operator, and is a good one in every respect.

The latest freaks of the telegraph in this section were in recording "Mrs. Sage recovered" for "message received," and, "a man kicked to death while burying a mule." Had the youth sending read the word currying, instead of burying, 'twould have appeared less an outrage upon the reputation of every living mule, as well as upon the memory of those who have kicked their last kick.

The Chicago Telegraphers' Ball Association have decided to hold their annual ball and banquet during the latter part of February. No pains will be spared to make it an enjoyable affair. The *Chicago Evening Journal*, in a recent issue, says of last year's ball: "It was the finest of the kind ever given in Chicago." The members of the fraternity in other cities are cordially invited to be present. The date of the ball will be given later.

INEWRI.

CHICAGO, Jan. 9, 1881.

## Long Island Railroad Notes.

To the Editor of *The Operator*:

SIR: We regret to state that Frank S. Gannon has severed his connection with the Long Island Railroad, and doubt if that company will ever be fortunate enough in again securing as faithful and energetic a man in their service. Mr. Gannon was a man who, by his hard work and skillful management, brought the Long Island R. R. out of chaos (although others, by a little manoeuvring, got the credit), and by his kind and generous disposition gained the love and esteem of every man on the road. He leaves behind him many kind remembrances, and has the very best wishes of all.

The offices of masters of transportation of main line and Atlantic division having been abolished, we are glad to see that Mr. M. W. Maguire has been appointed chief train dispatcher and train master, as, by his faithful attention to his duties, the promotion is richly deserved.

The company is to be congratulated in retaining the dispatcher's corps, as they, by their skillful and masterly work of last summer, reflected credit upon the company and themselves. The dispatcher's offices are to be consolidated at Long Island City, and are now as follows: M. W. Maguire, chief; D. Fonda, main line and branches; W. W. Griffin, Montauk division and branches; H. J. Quigg, North Side division and branches; D. H. Christie, Atlantic division; W. Hawkins, night dispatcher, with Messrs. Calkins, Callahan, Harris, Doyle and Kirk as operators.

## Boston Notes.

To the Editor of *The Operator*:

Sir: The Mutual Union Telegraph Company have taken an office at Room 26, Equitable Building. Dennison, of the New York Elevated Railroad Co., is with them; Richardson, formerly of Albany, and Hinds, are with the American

Union; Bradford, of the W. U., has gone with the Rapid; A. D. Skinner, of the W. U., has gone to Atlanta, Ga., for the Am. U.; Jim Crawford, of the W. U., goes to the Isthmus for the Canal Co.; McLean has gone to New Orleans with the Morgan R. R.; Willie Sampson Dewolf is adjuster of quads, W. U. Boston office. Tom Kelly has had his photograph taken; all the ladies are crying for it.

Weaver, of W. U., has gone to New Haven to take Associated Press. Dwyer and Donovan are at the old State House. Dickinson runs the Buffalo wire nights.

James Randall died Monday, Jan. 10, after an illness of three months. He was much thought of by his associates, who contributed the sum of \$100 for his benefit, and \$15 more for flowers, for decorating at the funeral ceremonies. Business has dropped off largely before and since the holidays. That, added with the prospects of consolidation, makes the boys feel that it's a "cold day."

U. KNO.

## Milwaukee Melange.

To the Editor of *The Operator*:

SIR: Your correspondent at this place lately spoke of the plug factory in the C. & M. office, but has kept silent on the subject of students in the N. W. office, which is why we rise to remark. Of course we can't object to the check-boys working up; many of us have risen from just such positions; but the idea of allowing students to practice on the wires, and even to receive and send important messages, is neither just to the profession nor to the patrons of the company. Some time ago a young Jew left the segar-making business and was allowed to practice in the office of that company. He was finally employed at a small salary (\$30 per month), and (so the story goes) in a week or so was discharged on account of a bad bull. Whether this latter is true we cannot say, but certain it is he has left telegraphy and gone back to his cheroots.

Another intelligent youth has been allowed to practice about here for several years past, and we are furnished with the following remarkable transpositions made in one night lately, at the excruciatingly invincible speed of five words per minute: "Kennononee" for "Kewaunee," and "G. C. Watteage, Chicago," for "G. C. Waldridge, Chatfield, Minn."

EXTERMINATOR.

## Hurry up, Edison!

Maxim is not the only man who is trying to get ahead of Edison, and the "Wizard's" Electric Light Company will probably not be the first to experiment on a large scale with the electric light in New York. Edison has promised to introduce his light in a down-town district immediately after a successful New Year's Eve illumination at Menlo Park, but the Brush electric Light Company is already erecting twenty-foot lamp-posts along Broadway from Union square to Thirty-fourth street, and the promise is made that the mile of electric lights shall be burning Christmas Eve. Has the public noted the fact that the price of lighting the streets with gas has fallen several dollars a lamp for next year? Somebody seems to fear the introduction of the electric light as a substitute for gas street lamps. Hurry up, Mr. Edison, if you expect to see your electric lamps, rather than a rival's, hanging in all the streets of New York. —*New York Mail*.

## Montreal Telegraph Company.

The annual meeting of the shareholders of the Montreal Telegraph Company was held at Montreal, January 13. The President's report states that during the past year a very large business has been done over the company's wires, and but for the reduction made last year in the rates of transmission, a considerably larger profit would have been realized.

The number of messages handled in 1880 was 2,112,101, an increase of 388,071 over the number handled in 1879. The increase in miles of poles for the year was 226; of miles of wire, 332; of offices (of which there are now 1,674), 55; of gross revenue (which in 1880 was \$550,840), \$72,404; and of expenses, \$23,012, showing an increase in the net profits for the year of \$49,302.

## TELEPHONE DEPARTMENT.

"Telephone" is of the feminine gender—it talks back.

The English Post Office authorities have just given an order for 20,000 telephones.

In Buffalo, N. Y., the Bell Telephone Co. and the A. D. T. are working finely together in double harness.

A would-be telephone expert writes to headquarters desiring to know the difference and relative values of a Graham Bell and an Edison telephone.

The Concord, Mass., State prison, twenty-five miles from Boston, is connected with that city by the wires of the Northern Massachusetts Telephone Co., which has established a number of telephone circuits in and around the State prison.

T. B. Doolittle, lately the proprietor of the Bridgeport Telephone Exchange, has accepted a position with the American Bell Telephone Company, and will for the present devote himself to the introduction of the telephone as a substitute for, and improvement on, the speaking tube.

President Dougham, of the Lowell District Telephone Co., is the "boss" superintendent of "telephone line construction." Under his supervision fifty poles recently went into the ground through twelve inches of snow and ten inches of frost. It is said "they will fall over in the spring."

Our Buffalo friends have leased the ground floor of a handsome iron building, corner of Washington and North Division streets, and will establish their executive offices there. When decorators and upholsterers finish their work it will be one of the handsomest and most commodious business offices in that city. Their new number will be 340 Washington street.

On Friday, December 30, 1880, Mr. C. H. Walton, manager in the office of the Metropolitan Telephone and Telegraph Company, was presented with a very handsome silver ice-pitcher and cup, by his co-laborers, as a mark of their esteem. Mr. Walton's monogram is engraved on the cup, and on the pitcher are the words, "Presented to C. H. Walton by the Employés of District number one."

The Bell Telephone Co., of Buffalo, is fast outstripping the municipal telegraph system, as a means of giving quick alarms to the Fire Department. Five times in one week of December last it summoned engines to burning buildings, either by telephone or the A. D. box, before regular alarms could be sounded; thus helping to save a large amount of property, and preventing the rush and confusion which always follows a regular alarm—the *bête noir* of the fireman.

The application for a mandamus in the suit of the American Union Telephone Company vs. the Bell Telephone Company to compel the latter to put telephones in the offices of the former company at Harrisburg, Penna. (reference to which was made in our last issue), came up at Harrisburg, on the 5th inst. After hearing argument, the Judge took the matter under consideration.

It might be interesting for some telephone men to know how much cold weather a Leclanche battery will stand and work without freezing. The Harrisburg (Pa.) Exchange have a telephone in a blacksmith shop where there is only a little fire during the day. The battery is in a tight, small box, with no packing. They also have a telephone at a railroad depot where there is no fire. The battery is in a small box, then packed in a box of sawdust. These telephones work right along with the thermometer down to five below zero, and seem to work as well as those in a warmer place. The batteries do not freeze.

Pat Carrigan connected his best ear with the telephone at the Mayor's office yesterday, when he heard a conversation between the Irish captains at two certain station houses. As soon as a lull came in the social chat Pat broke in with:

"You're an Irish pig."

One of the captains, thinking the talk came from the other, responded, "Tut, tut, mon; I tot I was conversin' wid a gintleman."

"You're sthinker," said Pat.

"I'll converse no more wid the loikes of ye," said the indignant captain.

Soon afterward the other captain explained

that he did not use the insulting language, and the pleasant chat was resumed. By this time the Mayor took charge of the instrument and overheard what follows:

"Have ye had any whiskey the day?" said Captain Michael.

"Not a drop; have you?" answered Captain Dennis.

"Two drinks of as fine a stuff as ye would find in a day's travel."

"Where did you get the drinks?" asked his Honor, the Mayor.

"At Bob's, up at the corner," answered Mike.

"You may consider yourself suspended for ten days," said his Honor.

And then a solemn stillness reigned in the region of the two station houses.

## SCIENTIFIC NOTES.

The magnet, as a means of mitigating pain and curing disease, is again seriously submitted to the consideration of specialists.

The English Government has ordered from the Brush company an enormous electric light equal to one hundred thousand candles. The largest made thus far is one of thirty thousand candle-power, now used in lighting up Wabash, Ind.

Prof. Graham Bell has been endeavoring to apply the photophone to the study of such sounds as may occur at the surface of the sun. This extension of the use of his late invention was suggested by M. Janssen. As yet, Prof. Bell has not secured very striking results, but he has obtained enough to warrant further efforts.

It may interest studious "test operators" to know that the intensity of atmospheric electricity, which under ordinary circumstances is always positive, is by far greater and more uniform during the night than during the day. From 9 o'clock P. M. until 3 o'clock A. M., it varies but little; it decreases at sunrise, reaches its minimum against 3 o'clock P. M., rises again rapidly, and attains its maximum at about 9 o'clock P. M. The amplitude of the daily oscillation is much smaller during the winter than during the summer months.

A patent, or "reissue," has just been granted to Mr. E. Berliner for the use of an induction coil with battery telephone transmitters. The claim covers broadly the use of an induction coil, in combination with a contact transmitter, or microphone, the primary short circuiter, with a battery, and the transmitter and the secondary proceeding toward the distant station. The patent is a reissue of his patent of Jan. 15, 1878, and has been assigned to the American Bell Telephone Company.

## DASHES HERE AND THERE.

Well posted—A telegraph line.

A dispatch from London says that Siemens, the cable manufacturer, is now running his works night and day to complete the new Atlantic cable for the American Union Company.

Mr. Preece, President of the British Society of Telegraphic Engineers, deprecates the plan for using the electric light in mines. He says the idea of the absolute safety of the electric light is a popular delusion.

The London *Court Circular*, having heard that Edison, as a means for producing incandescence, uses infinitesimal shreds of bamboo, procured at a great expense from Cuba, suggests that this new light should be patented under the title of "Edison's Electric Bamboozler."

Mr. O. W. Eisenhart was operator and agent on the M. and S. branch of the P. & R. R.R., at Excelsior Station, Penna. Patrick O'Brien went there on New Year's day to tell Mr. Eisenhart that "I am as good a man as you are." A row ensued, during which Patrick was shot and killed by the operator.

JAN. 8.—A. U. Manager to W. U. Manager.

"Good morning. How's the W. U.?"

"The W. U. is going to the d—l. How is the A. U.?"

JAN. 13.—W. U. Manager to A. U. Manager.

"Good morning. How is the A. U. to-day?"

"The A. U. has GONE to the d—l, sure; you have got us, after all."

The National Telegraph held its annual meet-

ing at Manchester, N. H., on the 28th ult., and elected the following named officers: Directors, Frederick Smyth, Col. John B. Clarke, George B. Loring; Clerk and Treasurer, Charles H. Bartlett; President, Frederick Smyth. A dividend of 5 per cent. was declared.

At the beginning of last month the Eastern of France Railway Station, Paris, was illuminated by the Lastin system of electric lighting. After having received a fair trial in the goods station, the electric light has also been adopted in the passenger station of the Lyons & Mediterranean Company.

Mr. Nicholas, an electric light engineer, has had a narrow escape from death, in England, by getting too familiar with the wires connected with the dynamo machine. He could not, of course, withdraw his hands, but as he fainted away the weight of his falling body tore him forcibly from the machine, and his life was saved.

Articles incorporating "The American Stock and News Telegraph Company," with a capital of \$1,000,000, have been filed at Albany.

The Pioneer Telegraph Company, with a capital of \$1,200, but with a proviso that the capital may be increased to \$1,000,000, has also been incorporated at Albany. Virgil W. Blanchard and others have also filed articles incorporating the Blanchard Electric Light Power Company, of New York, with a capital of \$1,000,000.

A watchmaker at Copenhagen is reported to have made a watch which requires no winding up, inasmuch as it performs that work by itself by means of an electric current. An electric magnet fixed inside the watch keeps the spring perpetually in a state of tension. All that is required to keep the watch going is to preserve the battery in proper working order, for which purpose one or two inspections in a twelvemonth are said to be sufficient.

A dispatch to the *World*, on the 2d inst., says: "The rumor that Mr. Gould intends to establish a new press agency for the transmission of special cable letters between the two countries excites not a little interest here, especially in journalistic circles, and further information is awaited with decided curiosity. The English press is at present very badly served with cable news from New York, and almost any change that could possibly be devised would be a change for the better."

Mr. A. J. Driver arrived at Galveston, Texas, on the 4th inst., en route for Brownsville, where he was to take charge of the Texas department of the Mexican Telegraph Company. This line will run from Brownsville to Brazos Santiago, whence a cable is to be laid to Tampico; thence to Vera Cruz, where connection will be made with a line running to the City of Mexico. Mr. Driver says the cable boats are on their way, and that the line is expected to reach completion in about a month. The line will connect with the Western Union lines at Brownsville.

This was the way in which Patrick O'Brien sent his Christmas greetings, after a seasonable spree:

"ALBANY, Dec. 23.

"Miss Mary O'Brien, Binghamton:

"Tired of living. Got razor in my pocket. Will cut my throat. Good-bye. You will not see me any more.

P. O'BRIEN."

The operator had sense enough to send out for a policeman and have Patrick locked up until he recovered from the effects of the gin.

The City Commissioners of Sewers, London, have recommended that the Anglo-American Electric Company light (the Brush system) be tried for a year in one of three districts of the city at an outlay of £1,410. For a second district the Electric and Magnetic Company's light (the Jablochkoff system) was recommended, at a remuneration for the same of £2,930. For a third district it was also recommended that the Siemens Brothers be paid £2,726, so that for twelve months a trial may be had of the Siemens light there.

The Norwegian coast is girdled by 1,200 miles of telegraph wire, and telegraph stations are established on the barren rocks of the Lofodden Islands, and in the hollows between the dark precipitous cliffs that form the Arctic face of Europe, for the sole purpose of warning fishermen of the approach of shoals of fish.

Here, among the screaming seabirds, a watch is kept of the movements of herring shoals, and particulars concerning their progress are flashed to the little settlements of hardy Norsemen who live by the harvest of the Arctic and sub-Arctic ocean.

The experiment of lighting the Hoosac tunnel by the electric (Brush) light was tried on the 22d ult. In parts of the tunnel free from smoke the light was thrown strong enough to do track work over 500 feet away, and driving spikes and shoveling 1,000 feet off. Between the central shaft and the east portal, where the smoke was so dense that an ordinary locomotive light would not be visible 10 feet away, the electric light could be seen for over 100 feet. In some parts of the tunnel one could read by the electric light 250 feet from the car. Engineer Locke was well satisfied with the experiment.

Professor Matthieson, after trying a great many experiments, has given us the following list of materials which resist the current of electricity in different degrees. The best conductor is named first, and the other substances in the order of their conductivity, the best insulator coming last: Silver, copper, gold, zinc, platinum, iron, tin, lead, mercury and the other metals; carbon, acids, saline solutions, sea water, rarefied air, melting ice, pure water, dry ice, dry wood, porcelain, dry paper, wool, silk, glass, sealing wax, sulphur, resin, gutta-percha, India rubber, shellac, paraffine, ebonite and dry air.

The French Government, on the 10th ult., laid on the table of the Chamber a demand for a grant of three hundred thousand francs in favor of the forthcoming International Electricity Exhibition and Congress at Paris. The Government points to the patriotic sentiments with which the subscribers of the guarantee fund are animated, and begs the Chamber to participate in a work which must prove most valuable to the advancement of a science which has lately made such rapid strides, and which promises to render such great additional services to the whole civilized world. One hundred and fifty thousand francs are applied for in favor of the exhibition itself, but the Government, wishing to keep the direction of the Congress in its own hands, asks for another one hundred and fifty thousand francs to cover all expenses.

A special dispatch from Omaha, Neb., says: "During the last twenty-four hours a singular atmospheric phenomenon, known as the annual electric storm, has been raging between Omaha and Ogden. During that time the telegraph wires have been useless through that region. The storm was accompanied by snow and high winds over 800 miles, between Omaha and Green River. The intensity of the storm is shown by the fact that when the telegraph key was opened by the operator a steady electric light burned at the connecting points. It is now practically over, and the wires are again open. L. H. Korty, chief operator of the Union Pacific Telegraph lines, has kept a record for years, and with but one exception in twelve years, this storm occurred on the 5th, 6th or 7th of January. It is believed that the entire Rocky Mountain region is visited by them. These storms have attracted the notice of electricians and scientific men generally."

## NEW YORK CITY ITEMS.

Echoes from 195.

Mr. Joe Fenn has been appointed assistant general circuit manager of the W. U. lines.

Several of the 195 operators are enjoying vacations, a large force and slack business admitting of their absence.

Messrs. Frank Glidden and Wood, from the Duxbury cable office, have been transferred to 195 until the cable, which is broken, is repaired, probably late in the spring.

The splendid working system recently introduced into 195 Broadway by Circuit Manager Jones, stamps him as being one of the most competent telegraph men in the country.

The new American Union line, New York to New Orleans, via Richmond and Augusta, has been opened for business. New York works direct with New Orleans without repeaters.

A party, numbering about twenty, from the operating department, indulged in a sleigh ride

on the 11th, driving from Brooklyn to Sheeps-Head Bay, where dancing and a fine supper were indulged in.

A rule of the office prohibits an operator from making an "extra" day's salary two days in succession. Operator "Fresh" succeeded in getting seven extra days into five regular days and barely escaped a lay-off until the extra was reduced to what is considered reasonable.

Mr. Brandell, known to the country at large as the "Fly Sender," has finally realized that operators are not like poets, said to be "born, not made," and is enjoying a rest from the imposition that pretended friends put upon him, in flattering him into the belief that he was the fastest sender in the world.

The boys on the St. Louis end of the duplex were in a fever of expectancy just before Christmas, when informed that a prominent stock broker had requested that their names be given him. Bronson thought it good for \$20. It subsequently transpired, however, that the broker asked for their removal for delaying his business.

"Chief Message Clerk" Stephenson's appearance in "full dress" the other day was thought by some to be the initiatory step toward uniforming the chiefs, a proceeding that would work well enough on the day force, though at night the operators should be uniformed, in order to designate them from the predominating number of chiefs.

On the first of the month the names of operators who have made the highest average during the preceding month are posted on the bulletin-board, an act which would induce school boys to great exertion. Some unconsciously have their record posted, but other instances are known where old operators take no supper hour and show a decided partiality for short messages, and thereby succeed in enrolling their names at the top of the list.

The New England Press Association has leased No. 4 wire between New York and Boston. The association agrees to pay the Western Union Company an annual rental of \$15,000 for a period of three years, besides paying all the working expenses. The superintendent of the leased wire is Mr. E. L. Beard, of the Associated Press office, Boston. The following are the stations and operators on the circuit: New York, Thomas H. O'Reilly and Ed Morton, day and night, respectively; in New Haven, Mr. Weaver (day only); Hartford, Cooke and Nihan; Springfield, Taylor and Miller; Worcester, Ryder and Wheaton; Boston, Kettles and Griffith; Providence, Ingraham and Bogle.

## PERSONAL.

E. Bear, W. U., Orange C. H., Va., has given up the telegraphic business.

E. P. Wilkins, from Burks, Va., has been transferred to Orange C. H., Va., Mid. R. R. Co.

H. C. Woodward, night operator Va. Mid. R. R. Co., Manassas, Va., has been transferred to Burks, Va.

Mr. A. D. Brewer, late of the W. U., has been appointed manager of the American Union office, Springfield, Mass.

J. W. Savage has resigned his position in Alexandria, Va., and accepted one with the B. & P. R. R. Co., at Odenton, Md.

Mr. W. J. Philips was, on the 6th inst., re-elected superintendent of the Philadelphia Police and Fire Alarm Telegraph for three years.

Mr. W. J. Curtis of fast-sending fame, shortly leaves North Sydney, C. B., for New York. Mr. Norman Sears, also of North Sydney, is now in New York.

J. C. Gentry, A. & P., Washington, D. C., has resigned, and returned to Gordonsville, Va., where he will act as cashier for the C. & O. R. R. Co., and practice law.

Mr. William D. Black, for many years one of the most reliable operators in the Western Union service at Philadelphia, has resigned, and joined the American Union office in the same city.

Messrs. J. Frank Howell, St. Louis Mo.; H. H. Kennedy, Toledo, and C. E. Russel, Muskegon, Mich.; spent Christmas week with their many friends in Grand Rapids, Mich., where they are always welcome.

Mr. C. E. Jones, of the firm of C. E. Jones & Brother, the well-known Cincinnati electricians and manufacturers, was married, Dec. 30, to Miss Maggie Welsh, daughter of Mr. and Mrs. P. J. Welsh, of that city.

The night-report operator in the Western Union office at Wilkes-Barre, Pa., is named Rush Jameson. Some of those who attempt to work with him think that "Rush" is a most appropriate name for a fast operator.

The telegraph office at Rockland, Me., is in charge of the ever pleasant and popular Mrs. A. I. Mather, with Miss R. Treet as assistant. The telephone exchange is in charge of Mr. W. A. Belcher, with Mr. A. D. Helm as chief.

We hear from Portland, Maine, that Mr. Henry Stevens, a much-respected Western Union repairman, is dangerously ill with paralysis of the throat and stomach. The doctors express fears that he must starve to death, as even milk cannot be forced down his throat.

At the Continental Hotel, Philadelphia, on the 27th ultimo, Mr. Warren D. Paynter, of the Bell Telephone Company, at Pittsburgh, was married by Rev. P. S. Henson, to Miss Fanny N. Terry. The ceremony was performed in the presence of a large number of personal friends of the bride and groom.

Mr. Sam. E. Watson, Grand Rapids, Mich., is one of the happiest ex-operators and telephone managers in the West. 1881 gives him the first increase in his family; it's a girl. Friends congratulate the house of Watson very heartily, wishing the compliments of the season and "many returns."

Mr. Geo. E. Holbrook, manager and test operator for the Erie Railway at "Hu," Jersey City, N. J., resigned, Dec. 31, to accept the position of superintendent of telegraph of the New York City & Northern Railroad, an excellent appointment. Mr. T. F. Mitchell succeeds Mr. Holbrook at "Hu."

The Atlanta (Ga.) American Union force consists of Messrs. J. W. Burton, manager (and a better one could not be selected); George Dalton, from the Western Union, Boston; E. E. Williams, W. U., Savannah and Col. William Sidney Stevens, from Griffin, Ga. The coming artist is Mr. Skinner, from the Boston Western Union office.

Mr. Frank W. Sabold, the genial manager of the American Union office at Indianapolis, was surprised on Christmas Eve, by the presentation of a gold-headed ebony cane. The presentation was made by Mr. W. T. Ward, on behalf of the employés of the office—Messrs. Ward, Carlile, Raper, Brooks, Thirkield, Dunn, Sherver and Breeding. Mr. Sabold acknowledged the testimonial in a happy little speech.

Mr. J. Levin, manager of the Western Union office at Atchison, Kansas, was the recipient of a Christmas present, in the shape of an elegant gold-headed cane, from his associates and admirers. Mr. Levin is one who has earned his epaulettes in our profession; and this unexpected recognition of his merits, by those who have to deal with him, is the best evidence of his popularity, talent and tact.

Mr. A. W. Clum, the son of Assistant Chief Operator Clum, of the A. and P. office, this city, was knocked from a car on the Pennsylvania Railroad, at the high bridge near Princeton, N. J., on Christmas morning, and was instantly killed. He was employed as a brakeman on the road, and was on his way home, intending to spend the day with his family, who were waiting when the news of his death arrived. Deceased was 24 years old and was to have been married in the spring.

On Christmas eve, the residence of Portland's well-known manager, Mr. C. D. Livermore, was invaded by the members of his (Western Union) staff, who, in the most unexpected manner, presented him with an elegant easy rocking-chair, Mr. H. A. Black making the presentation speech. Mr. Livermore, who was thoroughly surprised, replied as well as he could in an extempore manner. Mr. Livermore is deservedly popular with his staff and the great number of men who have worked for him in times gone by, and we are sure that no compliment, coming from such a source, can be too great for such an exemplary manager.

A TRIP OUT FROM ATLANTA, GA.—Taking a

trip out from Atlanta, on the W. & A. R. R., we meet the smiling face of Mr. R. H. Marchman at Marietta. At Dalton we see Mr. G. W. Anderson, and a few miles further on, at Tunnel Hill, we meet Mr. C. A. Hunt. Returning we branch off from the main line, and see Mr. Milton Orr, at Rome, always cheerful and always ready for business. Going toward Montgomery, we find Messrs. W. H. Handley at Newnan; W. J. Ragsdale at La Grange; P. H. Hammock at Shorter's Station, Ala.; E. Culp at Opelika, Ala.; S. H. Hill at Salem, Ala., and C. A. White at West-point. They are a good set, and always ready and willing to accommodate and favor the brethren.

U. S. SIGNAL OFFICE AT WASHINGTON.—Mr. J. H. Robinson is chief operator, and looks to everything pertaining to the circuits in first-rate style, but his special pride is the U. S. Coast Line, which, being constantly in trouble, gives him plenty of employment. The operators are: Mr. Charles O. Pierson, who has lately been duplexed, and now makes it warm for "N. Y." nights. Mr. John (better known as Jack) Fields makes a magnificent copy, and works extra for the American Union at the Capitol. Mr. George A. Smith is another gilt-edged copyist. Mr. William Spedden is one of the best natured fellows in the world. Mr. Harry Painter does not like to be hurried—he says it breaks him up. Mr. F. H. White is a young operator, but improves fast. Mr. L. C. Porterfield, who worked at "S. O." while the others were taking their vacation, has been promoted to Fort Whipple ("the seminary," it is called) to finish his course in meteorology. Nearly all those mentioned are old hands at the business, but entered the Signal Service during the depression, when salaries were down, and would now give the hair off their heads to get out again.

THE BURLINGTON AND MISSOURI RIVER RAILWAY IN NEBRASKA.—This road operates over 900 miles in Nebraska, and is rapidly extending toward Denver, Colorado. The telegraph department is ably managed by Supt. Yates, at Lincoln, assisted by Mr. Thomas McAlpine (our fast man) and Mr. Smith, the terror of the Republican Valley division. Mr. J. O. Phillippi (formerly with the C. B. and Q.) is assistant superintendent. At Plattsmouth, Mr. Ed. Gerrans is manager, assisted by "k s" and "S. R." The general office at Omaha is run by Little George (slow, but easy, and never put under the table). The present terminus of the R. V. Division is Indianola, where Mr. J. C. Swartz is agent and operator, assisted by Mr. Richard Storey, vice John Kenyon, who went recently to Kearney. There are only two trains a day west of Red Cloud on the R. V. Division, which gives the boys an easy time. Mr. Campbell, superintendent at Hastings, must have thought so when he started the stove-polishing outfit to polish their bald-headed stoves. "X d" man thought so, too. A subscription list for THE OPERATOR, which has been started along the road, is expected to receive great accessions when it reaches Woods and Gilbert, old-timers at "H N." N.

## BORN.

WILSON.—At North Sydney, C. B., Dec. 29, to L. W. Wilson, cable staff, a son.

HOADLEY.—To Mr. Edgar R. Hoadley, Jr., day operator and express agent I. M. R. R., Charleston, Mo., a daughter.

## MARRIED.

PARR—VAIL.—At Clinton, Conn., Dec. 21, 1880, by the Rev. J. H. Bliss, Mr. Charles H. Parr, acting manager A. U. Tel. Co., Albany, N. Y., to Miss Carrie I. Vail, of Clinton.

GLENN—WILLIAMS.—Nov. 15, 1880, at Baltimore, Md., by the Rev. Isaac Canter, Mr. J. A. Glenn, operator A. & P. office, Baltimore, to Miss Emma Williams, of Poughkeepsie, N. Y.

## DIED.

WILLIAMSON.—Of consumption, December 28th, Miss Anna W. Williamson, of the A. and P. main office in this city.

CLUM.—At Princeton, N. J., on Christmas day, 1880, A. W. Clum, son of the assistant chief operator in the A. and P. office in this city.

## EVERY

### ENTERPRISING TELEGRAPHER

#### SHOULD HAVE THE

## EMBLEMATICAL

# “Operators’ Card.”

I wish to call the attention of every operator throughout the country to a card, which is a carefully studied design, and which is giving excellent satisfaction wherever circulated. It is

### A MODEL OF NEATNESS,

Having different tints and styles of corners, and a gold beveled edge. Across it, in colored ink, is a beautiful representation of

### “AN OPERATOR AND HIS WORK,”

which has been designed and engraved expressly for this purpose. The card bears the name of the operator and address in appropriate type. This is the only card of the kind ever introduced, and is furnished at the very low price of

25 Cards for - 50 Cents.  
75 “ “ - \$1.00.

Orders promptly filled and satisfaction guaranteed, or money returned.

Send silver wrapped in paper, or scrip.

Great inducements to those wishing an agency.

Information cheerfully given.

### A. F. HURD,

Buskirks, Washington County, N. Y.

WE HAVE A NUMBER OF

## SECOND-HAND MORSE REGISTERS,

of standard makes, which we will sell very low. They have been re-polished and made as good as new; with or without weights and reels.

### DAVIS & WATTS,

BALTIMORE, MD.

## DON'T READ THIS.

If you do you will send stamp for circular of what every body writing should have in their daily practice.

### E. W. FARNHAM,

Room 6, 72 Monroe Street,

CHICAGO, ILL.

## PATENTS.

Copies of Patents, electrical and otherwise, including drawings and specifications, sent to any address on receipt of full address and thirty cents. Electrical questions of a practical nature, especially those pertaining to telegraphy, promptly replied to, and advice on patentability of inventions given by private letter, on receipt of one dollar and full particulars of invention, including, if necessary, drawings and diagrams.

### T. D. LOCKWOOD,

Prospectus mailed free on application.

## THE American Bell Telephone Co.

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly, or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This Company desire to arrange with persons of responsibility for establishing

## DISTRICT OR EXCHANGE SYSTEMS,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as agents, for the purpose of establishing

## PRIVATE LINE

AND

## CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

## SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company, No. 95 Milk street, Boston, Mass.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## THE FOLLOWING TABLE OF CONTENTS

will give some idea of the style and scope of our new book,

## TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY,

which is now attracting so much attention

PRE-ELECTRIC TELEGRAPHS.....	7
Signaling among the ancients—Telephonic system of the African negroes—Signaling by sound in Montenegro—Fire communication in war and otherwise—Dr. Hooke's telegraph—The semaphore—Semaphoric blunder and its result—The word "telegraph"—Prediction quoted by Addison.	
THE ELECTRIC TELEGRAPH—ITS BEGINNING AND DEVELOPMENT.....	14
First lightning-rod man—Frictional electricity discovered—The Leyden jar—Experiments to Franklin's time—His famous kite experiment—Robert Stephenson's boyish imitation—Lomond's electric signals—Lesage's invention of electric telegraph, using twenty-four wires—Reiser's thirty-six wire telegraph—Succeeding experiments to Morse and subsequently to present time.	
INTRODUCTION OF THE ELECTRIC TELEGRAPH IN THE U. S.....	29
First American line—Apathy of scientists, press and public—Why the <i>Herald</i> refused to encourage the telegraph—Cornell and Morse—First apparatus—Interesting relic—First week of telegraph—Slender returns—Humors of early-day telegraphy—Countryman, turkeys and telegraph—Mr. Stearns and obstreperous church bell—Honor to whom honor is due—Ronalds—Morse—Henry—Vail—Claim for laborers—"Be jabbers, who dug the post holes?"	
▲ CHAPTER ABOUT OPERATORS AND MESSENGERS.....	50
The operators' view of human nature—Their faithfulness—Their literature—Their difficulties and trials—Epileptic telegrapher—Armless operator—Deaf operator receiving by sound—The "lightning strikers' blunder and a case of jealousy—Recognizing by touch—Love over the wire—Love disappointment in humorous verse—First marriage by telegraph—Absconding operator caught by novice—Wonderful speed in telegraphing—Messenger service—District telegraph boys and the various duties they perform—Anecdotes of them—Uniformed messenger mistaken for policeman.	
THE TELEGRAPH IN WAR.....	70
Earliest military signaling—Introduction of field telegraphy—Field telegraphy described—Dangers to apparatus—Firing guns by electricity—Telegraph in civil war—Its great value—What General Sherman said of it—Origin of U. S. Military Telegraph—Cost of service during war—Duties of cipher operators—Official acknowledgment of their services—Anecdotes of military operators ready wit, heroic courage and nervousness—Funny war story—Another—Military operators' poor quarters—A provident telegrapher—Richmond taken—Receipt of the great news—Lincoln's assassination—Grand feat of Prussian soldier, and heroism of French female operator.	
CABLE TELEGRAPHS.....	95
General—The Atlantic cable—First suggestion of it—Its origin—Organization of company—Laying cable—The Great Eastern—Discouragements—First message—Suggestor wittily silenced by Mr. Field—Cost of first Atlantic cable—Recent improvements in cable laying—Mr. Field's services—Cable operators—Cable codes—A specimen—Its interpretation.	
HUMORS OF THE TELEGRAPH.....	107
Economical Irishman—Timid old lady—Apprehensive Texan—Witty, incongruous and rhyming telegrams—A "killing" blunder—The "additional wurred"—A furious message—Satchel by telegraph—Snubbing a king—A proper old lady—Little "Johnny Russell"—Peter to Margaret Flaggarty—He couldn't be fooled—"She writes like a man"—Model (?) Maine man—Hollow and "hello"—Fooling savages—"Onnateral fixins"—Chicago and "—Witty illustration—Electrifying loafers—Shocking the negroes—Blind-folding the "masheen"—A crammer.	
TELEGRAPHIC "BULLS".....	123
A fatal "bull"—Matrimony killed by a "bull"—Instances of operators' "bulls"—A lord's mistake—John Brown and Seaton Bros.—Aie or oh—Too much coffee—Blessings in disguise—A provable mistake—A military "b l l" that was not all a "bull"—Senders' "bulls"—Habit and habit—"Bulls" from bad spelling—A fishy story—Tragic "bull"—Injustice to operators.	
LIGHTNING FREAKS AND TRAGEDIES.....	138
Deaths from lightning—Effects in different countries—A triple tragedy—Curious freaks of lightning—Some wonderful instances—Lightning in telegraph offices—Operators killed.	
SHARP PRACTICE BY TELEGRAPH.....	143
Abuse of General McClellan's name—A modern "St. John"—Big swindle in Toledo—"Spiritualistic" swindling—Rappers' tricks—Their magnets—How to make them—Sir Charles Wheatstone's experiments—Two good stories of sharp practice by operator—Fampering with cipher message—The biters bit—Great bank swindle—Barb's telegraphic trap for burglars.	
THE TELEGRAPH AN UNIVERSAL INSTITUTION.....	160
A well-traveled message—Spanish peasants and telegraph—Telegraph in Morocco—China—India—The East in general—Japan—In Africa.	
THE WEATHER REPORTS.....	168
Death of General Meyer—His account of storm signal system—Its value to commerce and agriculture—The New York station—Cipher reports of weather—Difficulties of signal service—Early opposition—Origin of weather reports in the United States—Smithsonian Institution—Professor Henry.	
THE RAILROAD TELEGRAPHIC SYSTEM.....	179
Originated in England—First instance of train dispatching in this country—System at Grand Central depot—Moving trains by telegraphic orders—Official instructions—Train dispatchers and operators—Their responsibility—Thrilling incident—Operator who "forgot"—Noble operator—Latest inventions in railroad signaling—The train telegraph—No more screaming engines—Supplying locomotives with water by electricity—Fun on the railroad—Waking the Pullman porter—Operators' anti-suporific.	
ELECTRICITY AND LIFE.....	202
General remarks—Electric girl of La Perriere—Electrical lady of Nevada City—Electricity on dinner table—Feeling pulse by telegraph—Development of growth by electricity—Uses in surgery and dentistry—Electricity as a healer—An "anti-fat" story.	
OUTGROWTHS OF THE TELEGRAPH.....	218
The electric light—Edison's description—The light at Niagara—Experiments in San Francisco—Proposed illumination of Holyoke—Use in stores, steamships, and in war—The telephone—How constructed—The German name for it—Its invention—Telephone service meter—Transmitting sermons by telephone—First instance—Mr. Beecher's—The telephone in Jersey City law courts—Communicating between ships—Use in wooing—In military operations—Music—Humors of the telephone—The singing telephone—Yarn from Pine Bluff—Joke on reporters—One for Dawdles—Marriage by telephone—Telegraphing by light—The photophone—Electrical egg hatching and seed germination—Theatrical thunder—Toothache cured by electricity—Gas lighting and bell ringing by same means—Electricity as an umbrella—In taming horses—In connection with Moody and Sankey's meetings—Telegraphing by electrical air currents—Maps by telegraph—Magnetic magic writing—Electric driving power—Electricity in managing refractory horses—Engraving by electricity—Diagrams of targets over the wire—Electric combs and brushes—New uses for the sun's rays—The ocean a source of electricity—Suggested use of electricity in executing criminals—Slaughtering cattle and killing whales by electricity—Electric clocks that require no winding—Telegraphing by steam at sea—Electricity in steam—The Edison electric locomotive—Description of it—Electricity aiding weary cash girls—Conclusion.	

Copies promptly mailed, prepaid, on receipt of price, \$1.

W. J. JOHNSTON, Publisher,

P. O. Box, 3,332.

No. 9 Murray Street, New York.

PRICE REDUCED TO ONE DOLLAR.

## Lightning Flashes and Electric Dashes;

A VOLUME OF

Choice Telegraphic Literature, Humor, Fun, Wit and Wisdom.

CONTRIBUTED TO BY

ALL THE PRINCIPAL WRITERS IN THE RANKS OF TELEGRAPHIC LITERATURE, AS WELL AS SEVERAL WELL-KNOWN OUTSIDERS.

COPIOUSLY ILLUSTRATED.

176 Large Octavo Pages. Cloth. Price, \$1.

This book is a lasting example of the literary talent and native wit of American telegraphers, all the lights of the profession having banded together to give us a book well worth reading.

"Every person who has the fortune to see this volume will desire to possess it."—*N. Y. Hebrew Leader*.

"Written in a bright and sparkling style, and the numerous illustrations lend an additional interest to the work."—*N. Y. Graphic*.

"The interest of the reader commences with the initial chapter, and from this to the end of the volume there is nothing but a succession of pleasurable surprises."—*Harrisburg (Pa.) Independent*.

"Thoroughly telegraphic and highly amusing, the cartoons cleverly executed, the narratives pithily and in part brilliantly worded, while the variety supplied will make it difficult for any who may have the privilege of reading the book to do so without enjoyment."—*London (Eng.) Telegraphist*.

THE OPERATOR, 15 Months, and Lightning Flashes, only \$2.00.

## DISCOUNT ON ORDERS FOR BOOKS.

Where any of our publications to the value of \$4.00 or over are ordered together the purchaser may deduct

25 Per Cent.

from the regular retail price before remitting. The books will then be forwarded, post age or express charges prepaid. All orders filled on the date of their receipt.

We will send to the same or separate addresses any two of the books marked at \$1.00 for \$1.75, and THE OPERATOR for fifteen months in connection with any one dollar book for \$2.00.

## How Enterprising Operators may Add to their Incomes.

Enterprising operators along the line of railroads and in large cities can add a comfortable sum to their income by selling our books to their co-laborers and friends, and availing themselves of the liberal discount which we give to agents.

Canvass your district, then send us an estimate of how many books you can dispose of, with their names, and we will give you such a rate on the entire consignment as will leave you a respectable margin for yourself.

Address, for particulars,

W. J. JOHNSTON, Publisher,

## THE BISHOP GUTTA-PERCHA WORKS,

Original and only Manufacturers in the U. S. of

**PURE GUTTA-PERCHA GOODS,**

**422, 424, 426**

**EAST TWENTY-FIFTH ST., N. Y.**

ESTABLISHED IN 1847.

### S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description, under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA for Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds. Submarine Telegraph Cables, 50 varieties, one to ten conductors.

Submarine Telegraph Canal Cables—any number of conductors.

Aerial and Underground Cables of all styles. Hemp armor covered.

Lead-Covered Telegraph Cables, one to seven conductors.

Office Cables, one to seventy-five conductors, gutta-percha and cotton-covered.

G. P. Insulated Wire of all sizes.

Fuse. Leading and Connecting Wires for submarine and mining purposes.

Marks' Compound Office Wires, various sizes, for office, underground, and outdoor use.

G. P. Office Wire, cotton-covered.

Flexible Elevator Cables, any number conductors desired, of every style, and for all purposes.

Compressed Electric Cotton and Linen Double and Triple Covered Cordage any style or pattern.

Burglar Alarm, Call Bell and Annunciator Wires, double cotton wrapped and saturated with any preparation.

Magnet Wires, copper and German-silver, cotton, silk, and fibre covered.

Copper Wires, specially covered for electrical lightning purposes.

Telephone Flexible Cords and Magnet Wires, finest and best manufactured.

Agents for Reception of Orders and Sale of Goods:

L. G. TILLOTSON & CO., 5 & 7 Dey Street, New York.

WILLIAM HEATON, 503 Chestnut Street, Phila.

All orders to the Factory should be addressed:

**W. W. MARKS, Superintendent,**  
422 East Twenty-Fifth Street.

## J. H. BUNNELL & CO.'S New Steel Lever [Solid Trunnion] Key. PATENT APPLIED FOR.

### BEST IN THE WORLD.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for rapid and perfect Morse sending, for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking is absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert or the beginner.

**Price \$3.00. Finely Finished and Lever Nickel-Plated.**

Liberal discount on orders for company supply. Sample Steel Lever Key sent by mail, post-paid, to any part of the U. S. or Canada on receipt of above price, by registered letter or money order.

### CONSOLIDATION.

"Once on a time"—a time of dread,  
With wages low and hope departed—  
Along the line the tidings spread,  
"A rival company has started."

The infant soon developed strength;  
Not long was it an infant rated;  
And when the poles were raised at length,  
Our hopes were also elevated.

From pole to pole the wires were strung;  
Silenced was every doubting Thomas;  
And loudly were its praises sung—  
Believed was every golden promise.

And still it rapidly progressed,  
Proving itself a mighty rival;  
In North and East, and South and West,  
With surest prospects of survival.

When, suddenly, in skylight clear,  
The thunder rolls—the lightning flashes—  
At once with dire dismay we hear  
A crash among the dots and dashes.

The one we trusted now is lost  
In a gigantic corporation;  
Our trust was vain—our hopes are crossed  
And blasted in Consolidation.

CECIL.

### Our National Portrait Gallery.

#### III.

WILLIAM DEAN WEST, OF NEW ORLEANS.

The worthy subject of this sketch, Mr. William D. West, was born of English parents, near Bridgeton, New Jersey, Jan. 26, 1851, so that he has just completed his thirtieth year. When three years old he was taken to Wisconsin and was brought up on a farm, receiving an ordinary country school education, until he was 14 years of age. At this time he began life for himself, and, like Mr. Edison, commenced as newsboy on a railroad—the Milwaukee & Prairie du Chien road. In one year he had learned the art of telegraphing, and from 1865 to 1868 he had charge of several small offices on that road. Like most young operators at that time, Mr. West drifted out to that telegraphic Mecca, the Union Pacific Railroad, and in 1868 was at Spring Creek, Nebraska. After remaining a year on the Union Pacific, he joined the Western Union service, and worked successively at St. Joseph, St. Louis, Shreveport and New Orleans. He then transferred his services for a brief period to the Pacific and Atlantic Co. at St. Louis, but returned, in 1872, to the Western Union office at New Orleans, where he was married and has since remained. As Mr. West has

become renowned as a fast operator, it would scarcely be worth while to specify particular cases; but it may be an appropriate time to recall the historical fact that it was in New Orleans, in 1873, that he received, over a continuous

The Consolidation Assured—Progress of Negotiations—The Temper of the Public.

On Wednesday, Jan. 17, the Western Union, American Union, and Atlantic and Pacific Telegraph Companies were practically consolidated

WILLIAM D. WEST.

wire, from New York, Mr. George Eitemiller sending, 100 red messages in an hour and forty minutes, there being repeaters in at Pittsburg, Cincinnati and Memphis.

In social qualities Mr. West is fully equal to his professional reputation as an excellent telegrapher, and we consider him as among that little circle of operators which will be heard from again at some time in the near future.

by the votes of the various boards of directors.

It is safe to say that no telegraphic change has ever created so profound a feeling throughout the country. It has raised the hopes of a good many of the smaller and embryo companies, for the bare fact that the American Union had been practically built up within a year gave a ray of hope to which many people cling like a drowning man to a straw, forgetting the fact that all the

available rights of way are so occupied by the three companies which at present exist that it will be exceedingly difficult for any new company to get a foothold. The promoters of the consolidation assure us that all talk of opposition is sheer nonsense, inasmuch as the Page patent would prevent the formation of any new companies to work the Morse system, and that it would most assuredly be used to stop even the Government from using that system. This, however, is no obstacle, as the Delany patent relay is a satisfactory substitute for, if not a much better device than, the Page patent. Even if Mr. Delany's genius had not obviated that difficulty, the Government, if it desired to use the Page patent, could take it in pursuance of its undisputed right of eminent domain, and its consequent authority to convert private property to the use of the commonwealth on payment of a reasonable compensation.

Congress took hold of the question with commendable promptitude, though in its zeal for the public welfare there is danger of playing into the hands of speculators. The newspapers are, however, in the main, clear and emphatic on the question, and with this restraining influence there can be but little fear of Congress going wrong. A detailed report of its proceedings will be found in another column.

In the various States the law officers and the disgusted public are proceeding more cautiously. In the Assembly, at Albany, on the 20th ult., Mr. Spinola called up his resolution in relation to the consolidation of the telegraph companies, and supported it in a short speech in which he insisted that the consolidation was against the public interest. The preamble was stricken out and the resolution attached, which instructs the committee to inquire into the proposed consolidation and report a bill to prevent it, was adopted. According to the prospect just now the report will be ready about the first of March, too late to interfere with the present consolidation. In Pennsylvania such a consolidation is expressly forbidden by the new constitution, adopted in 1874. The closing sentence of section 12, article 16, of that instrument is as follows: "No telegraph company shall consolidate with or hold a controlling interest in the stocks or bonds of any other telegraph company owning a competing line, or acquire by purchase or otherwise any other company's line of telegraph." Immediately upon receipt of the news of the contemplated consolidation, the Attorney-General of Pennsylvania commenced an opinion, taking the ground that the American Union and Western Union will forfeit their rights and privileges in that State by persisting in the negotiations. This ought, in the natural course of events, to block the arrangements in Pennsylvania; but the master mind that controlled and guided the stupendous scheme of consolidation will not be at a loss for an expedient to circumvent the constitution of a mere sovereign State.

In Canada, the news of the consolidation created a panic. The public were aware that Gould owned nearly \$300,000 worth of Dominion stock and held the lease of the line under a promise to pay five per cent. on its capital for ninety-nine years. They argued that Gould would thus throw no more business over the wires of the Montreal company than he could help. The price for Montreal Telegraph therefore fell 13 per cent. on the 14th and 15th ult., while the shares sold amounted to nearly a tenth of the company's capital.

Among railroads, the Baltimore & Ohio has been the first to show a tendency to kick back. That road has promptly refused to consent to a transfer to the Western Union of its contract with the American Union.

Among the merchants the excitement reached fever heat, although there is something ludicrous in the patient attention which they give to letters and verbal propositions from a crowd of phantom companies, all bearing high-sounding names and offering to connect up most remote parts of the world on short notice, if capital were only supplied; all professing to have taken "preliminary steps" toward effecting a mammoth op-

position, but in whose ranks a \$20 bill must be a curiosity.

But the brokers, at least, are in earnest. Two days after the first intimation of consolidation a large meeting of the Cotton Exchange was held in this city (Jan. 15), at which great promises were made for the incipient opposition.

The American Rapid was declared to be nearly ready to introduce a simple form of the perforating machine into private offices, so that ever broker might become his own telegraph operator—an idea which will prove as objectionable to operators as the most exclusive monopoly. The Mutual Union, which has lately given many signs of lasting vitality, was very favorably mentioned, as were also the New York, Land and Ocean Telegraph Company, the Pioneer Telegraph Company and the American Stock and News Company, all of which may soon take definite shape as a combined and formidable opposition.

The "New York Land and Ocean Telegraph Company," which was organized about a year ago, gives great promise for the future. The British has given it the right to land on any portion of its coast and to construct land lines. The capital of the new company is to be \$6,000,000. It has partly closed the contract for laying two cables of phosphor-bronze, guaranteed to transmit 20 words per minute each, and to cost \$9,000,000. The intention is to charge 20 cents a word to the general public, and a less rate to the press for the service. At first the company will build land lines to connect only the principle cities with New York. A clause in the company's charter forbids it to combine with any other company in regard to rates, or to sell out to or consolidate with any other company under penalty of forfeiture.

Hints are also given of the formation of a gigantic telegraphic combination which will include nearly the whole telegraphic world, with General Eckert at its head. An account of it will be found in another column, under the head of "Another Vast Telegraphic Scheme."

At this Cotton Exchange meeting speeches were made, and a committee of eleven appointed to "confer with the Cotton, Produce and other Exchanges throughout the country, as well as with bankers, merchants and others opposed to any monopoly of the telegraph business of the United States, with a view to having telegraph business performed by a company so organized as to prevent its being absorbed by or consolidated with any other company."

The Cotton Exchange at St. Louis, on the 20th ult., adopted a resolution for the appointment of a committee of three to confer with the New York Cotton Exchange, with a view to having telegraphic service performed by a company so organized as to prevent it being absorbed by or consolidated with any other existing company or companies. A resolution favoring government control of the telegraph lines of the country was defeated.

A special meeting of the Board of Trade and Transportation was held in this city on Friday, Jan. 28, to consider what steps should be taken to prevent the telegraph consolidation. The meeting was unusually well attended, and the monopoly was vigorously denounced. Resolutions were adopted urging the repeal of an act of 1870, under which the proposed union will be made, or its amendment, so as to prevent the union. The board's committee on legislation were placed in charge of the object sought to be gained by the board. It was thought that prompt action could secure the repeal, or amendment, of the law, in time to prevent the possible ratification of the telegraph agreement by the stockholders' meeting.

In Ohio, leading members of the General Assembly have been consulted in reference to the advisability of passing a law which will prohibit the proposed consolidation. Prominent attorneys are of the opinion that the proposed consolidation of the interests of the companies within the State can be prevented by an act of the Legislature, and cite as a precedent an act passed seven years ago, which prevented the consolidation of the Cleveland, Columbus, Cincinnati and Indianapolis Railway and the Atlantic and Great Western road, two lines running parallel from Cincinnati to Cleveland. On the other hand, however, it is claimed that nothing can be done in that State to checkmate the consolidation, and that the Legislature is rendered

powerless by its own enactments of last winter and the constitutional provision of non-interference with vested rights.

In the Pennsylvania Senate on Tuesday a resolution was passed calling attention to the constitutional provision against telegraphic consolidation, and directing the Committee on Corporations to determine what legislation is necessary to carry the Constitution into full force. Immediately after the passage of this resolution a bill was presented to the Senate, entitled "An act to escheat to the Commonwealth the telegraph lines and property of telegraph corporations, associations and companies which violate the provisions of the Constitution prohibiting the consolidation with, or the holding of, a controlling interest in the stock or bonds of a competing line of telegraph, or the acquisition, by purchase or otherwise, of any other competing line of telegraph."

It provides that after a final decree of the Court establishing the forfeiture and escheat to the Commonwealth, the Auditor-General shall proceed "to sell by public auction at the Capitol, in Harrisburgh, the telegraph line, property, stocks and bonds so escheated."

It seems incredible that this clause should be found inapplicable to the case, as it had never been supplemented by appropriate legislation fixing penalties for its violation. It would thus appear that the people of Pennsylvania are denied the benefits of their boasted new constitution, as applied to this case, owing to the neglect of their Legislature.

During the past week a number of capitalists of Chicago have formed an association for the construction of a four-wire telegraph from that city to New York. Among them are N. K. Fairbank, George L. Dunlap, George C. A. Kent, H. W. King, and Samuel Johnson. Another party of capitalists, including Marshall Field and John B. Lyon, in the same city, organized another association, intended to take in all the principal Eastern cities with direct lines from Chicago. When the two parties found out each what the other was doing they immediately consolidated, and have sent an application for a charter to Springfield. On the 24th ult., at Springfield, Illinois, the Secretary of State authorized Edison Keith, M. S. Crosby and C. D. Hamill, of Chicago, to organize the "Merchants' Telegraph Company," with \$1,000,000 capital. The principal office is to be in Chicago. The company is authorized to construct lines from Chicago to any part of the United States. The object is a line to New York. It is further stated that the brokers have had a line between Chicago and Milwaukee running for some time past, and have been doing business at the rate of 10 cents for ten words. The profits of 1880 to the stockholders amounted to 400 per cent. on their original investment after the payment of all expenses, and before the consolidation was announced it was intended to extend the lines to St. Louis.

The members of the New York Produce Exchange say there will be no trouble in obtaining all the money needed in Chicago without asking for public subscriptions, but that if this should not be so all the projectors have to do is to come to New York and they will be accommodated. They can in any event be assured of receiving the full patronage of the New York merchants.

Meanwhile, Mr. Jay Gould, Mr. Vanderbilt, General Eckert and the other principals were quietly engaged in arranging the details of the consolidation, regardless of the clamor on all sides.

On the 19th ult. the second act was completed. On that day, at eleven o'clock in the morning, the board of directors of the American Union Company met, in this city, President Eckert in the chair, and formally approved of the plan for consolidation. At noon on the same day the Western Union board of directors met and went through a similar form; and at two o'clock the Atlantic & Pacific's directors—nine out of the fifteen trustees of which belong to the Western Union—met and ratified the scheme of consolidation. But one step now remains to be taken—the ratification by the stockholders, which is morally certain to take place on the 5th of February.

As the rules of the Stock Exchange require 60 days' notice of a new issue of stock, the stockholders' meetings of the three companies to vote on the agreement can not be held before next

Saturday, the 5th inst. Meanwhile, President Green has issued a notice for a special meeting of the stockholders of the Western Union Company for the purpose of acting upon the terms of consolidation, purchase and agreement between the Western Union, American Union and A. & P. companies "for the purchase of property, rights, privileges and franchises of said last-named companies respectively, and the increase of the capital stock of this (Western Union) company, to the full amount of eighty millions of dollars."

Immediately after the directors' meeting, just referred to, Mr. Rufus Hatch, of this city, commenced a suit in the Supreme Court against the three companies, to prevent the contemplated consolidation; and on the 20th ult. obtained an injunction restraining the defendant companies "from entering into any agreement of consolidation, and from increasing their capital stock and other matters." This suit, however, will have about as much chance of success as the prohibitory injunctions of the Constitution of Pennsylvania has with these men, or as the suit brought, some time ago, to prevent the "pooling" arrangement between the Western Union and A. & P. Messrs. Gould, Vanderbilt and Co., express "doubt" as to the power of the courts to interfere with private rights, as the proposition for consolidation has been unanimously approved by the responsible parties of each company.

On Wednesday last argument commenced, and affidavits were produced to show that Mr. Hatch was "short" on facts as well as on Western Union. The argument continued until Friday, Jan. 28, when the Judge took the papers and reserved his decision.

The New York *World*, of Friday, Jan. 28, published what it called "a careful abstract of the agreement by which the Western Union Telegraph Company purchases the assets, plant, patents, real estate and stocks owned by the American Union and Atlantic and Pacific telegraph companies."

When questioned as to the correctness of the *World's* version of the agreement, Dr. Green, President of the Western Union, said:

"I have been very much puzzled about that publication, and, without comparing it with the contract, to see if it is correct in all particulars, I can only say that the figures are substantially correct. It cannot be considered authoritative, as no authority is given for the statement, but the story is so accurate in its details that it must have been written by some one who had read and studied the agreement."

Dr. Green professed confidence in the execution of the scheme, but added that he should consider it, as in the case of the Atlantic and Pacific arrangement, a hard contract for the Western Union.

Following is a synopsis of the agreement as published in detail in the *World*: The consideration paid the American Union is 150,000 shares of Western Union stock for 100,000 shares of American Union stock and \$5,000,000 bonds, the Atlantic and Pacific receiving 84,000 shares of Western Union stock for 140,000 shares of A. & P. stock. The 72,010 shares of A. & P. stock, belonging to the Western Union, are to be included in the exchange, the Western Union stockholders directly receiving the stock issued for them. The Union Trust Company is to conduct all these exchanges. The Western Union is to increase its capital stock by \$38,926,590, of which \$15,526,590 stock will go to the present stockholders and the residue (\$23,400,000) to the other telegraph stockholders, on the basis of the above terms. The Western Union stockholders are also to receive the \$58,355.50 of stock now in the company's treasury. The Western Union undertakes all the telegraph and other contracts of the other companies, particularly the American Union's agreement to lease for cable messages certain wires to the owners of the two new cables about to be laid across the Atlantic Ocean. The contracts of the A. & P. now in litigation, or in regard to which any litigation or adverse claim has arisen, are excepted. The agreement of February 28, 1880, between the Baltimore and Ohio Railroad Company and the American Union is particularly excepted. The Western Union is to be put into possession of its purchase on February 24, but the purchase is to date from January 1, 1881, all earnings and expenditures of either of the purchased companies since

the latter date being considered for account of the Western Union. The American Union stipulates that the assets of the Central Construction Company and all its properties, rights and franchises remaining after the discharge of its debts shall be turned over to the Western Union. In case the corporate authority requisite for the consummation of the general agreement cannot be secured, no liability for damages is to arise therefrom to any of the parties, but the agreement shall be void. In the event of delay from legal process, no liability is to accrue therefor to the party affected, but the rights of the parties to the agreement are not to be otherwise affected thereby.

We may as well recognize now that the fact of consolidation can no longer be questioned, and that the three companies thus combined under such able management will form a monopoly which it will be exceedingly difficult to reach. Congress, merchants and the general run of speculators must not forget that, under the spur of a cut-throat competition, telegraphic rates have been reduced below a paying figure, and that telegraph companies are not purely eleemosynary institutions. A ruinously low tariff to the public means a starvation salary to the working operator; and, monopoly or no monopoly, we must have a fair paying rate on telegrams.

It should also be stated that the great body of operators display a surprising amount of philosophy under the new order of things; and, while the total extinction of opposition, for the time being, is deeply regretted on all sides, there is much confidence exhibited in the good faith and executive ability of the leader of the newly-established monopoly. The operators have really no immediate interest in the matter of high or low tariffs, and concern themselves principally in discussing their own affairs. It is apparent to them that a certain number of their fraternity will suffer by the consolidation, though not so many as it was at first feared, but it is generally admitted that, judging from former precedents, at least ninety per cent. of the victims will better themselves by the upheaval, while the remaining ten per cent.—the customary quota of ne'er-do-wells—will need the generous helping hand which one genuine telegrapher, poor as he might be, never yet refused to another.

#### A Great Storm and Destruction of Telegraph Property in New York.

On Friday, Jan. 21, a tremendous storm of sleet, rain and wind laid waste nearly the whole of the telegraph and telephone wires in and about New York and Brooklyn, and on that day this city was relegated to the condition in which it existed before the invention of the electric telegraph. The damage done has never before been equalled in the history of telegraphy in this country. The 276 circuits leading from the Western Union main office, and its 100 local circuits were all out of order; the American Union and Atlantic & Pacific circuits were in a similar predicament; telephones became dumb; the stock, police, fire-alarm and American District machinery lapsed into utter and irresponsible silence, and Manhattan Island was severed from the rest of the world, while all day long persons were calling at the offices of the various companies to complain that falling poles and stanchions were tearing down their walls and ripping off their roofs.

At daybreak all the telegraph wires in the city had assumed the appearance of small, white threads; and, as the morning wore on and the storm increased, they took on fresh accumulations of ice, and grew in size until they became great thick ropes of crystal. The silver strands thus formed ran in great parabolas from pole to pole; they hung in every direction, interlacing one another and forming geometric figures and graceful, glittering festoons of lace-like patterns. Then, as their weight of ice increased and the breeze freshened, they snapped asunder and dropped writhing into the streets, sagging and swinging

across the railway tracks or, broken off short, lashing the sides and windows of adjacent houses. Policemen at first caught up the ends and wound them about lamp-posts, hydrants and convenient posts; but the wreck quickly became so general that the order was given to wayfarers, "Every man look out for himself." Some idea of the severity of the sleet storm may be obtained from the fact that all the clocks on the churches and public buildings were stopped by the accumulation of ice on the hands, all stopping nearly at the same time—between 8:30 and 8:45 A. M.

From that time onward there was no cessation until the havoc and ruin was complete. Telegraph poles, some of them carrying 120 wires, came crashing down in all directions. At the Post-office the great stanchions on the roof with their burden of wires were torn off by the force of the wind, creating a panic in the street. "Look at that pole," yelled a truck driver, pointing to a great mast, swaying like a reed before the breeze. "Clear the street there!" The police rushed forward; passers-by dodged into convenient doorways; an occasional woman or child was rapidly carried to a place of safety, and then there was a moment of suspense. "See her sway; there she goes; going, going—look out—gone!" And the pole, caught by the gale, came sweeping down and shot through the 12-inch wall of a saloon on the opposite corner, "like a needle through cheese," as the truckman expressed it. And so throughout the day the destruction went on, this scene being continually repeated.

The telegraphic fire alarm system was, of course, abandoned and mounted firemen paraded the streets in search of possible fires, and ready to gallop with a timely warning to the nearest station. The police had to resume the slow and unsatisfactory method of communicating to one another by messenger. At nightfall the great city, isolated from the rest of the world, had gone back to the appliances for fire alarms in vogue forty years ago, and men were once more stationed in the old, half-forgotten watch towers, to scan the roofs for miles around on the look-out for fires, while the cracked and rusty old bells were again brought into use as alarms.

The damage to the telegraphic property was too great and widespread to admit of a detailed report. What narrowly escaped being a serious accident was reported at Second avenue and Forty-third street, when an engine caught a bunch of telegraph wires that had fallen across the track and, before it could be stopped, uprooted and threw down nearly a dozen neighboring poles. On all the other railroads trains were run slowly and cautiously, owing to the fall of poles across the track.

There were a great number of casualties reported throughout the city.

The wreck was nearly as great in New Jersey, within thirty miles of the city. At Guttenburg, N. J., three hundred poles went down. In Newark, the tall masts swayed and trembled so violently that the police were obliged to stop traffic on a number of streets. All the wires over the Newark Bay Bridge, one and seven-eighths of a mile long, on the line of the Central Railroad of New Jersey, were torn down by the poles, which were bolted to the bridge, snapping like pipe-stems. Telegraph wires and poles were also broken down in Elizabeth, Paterson, New Brunswick, Orange, Bloomfield, and other New Jersey cities, and electric communication was interrupted more or less all over the State.

Beyond Elizabeth, partial communication was maintained with the South and West, and on Friday and Saturday news and private messages were carried between Elizabeth and New York by train.

On Friday, Mr. G. K. Walcott, of the Western Union main office in this city, started from New York for Boston at 4 P. M., with bundles of messages for New Haven, Hartford, Springfield and Boston, but ascertaining that the wires were all working east of New Haven, he stopped there and Manager Fairchild putting his full force at work on the business, by eight o'clock everything was clear. Mr. Walcott had with him Amos Learned's afternoon press reports, which he started on the regular press wire, and having also the late editions of the New York evening

papers, he made up a full Associated Press report, and with Mr. Weaver, the press operator, sent the whole batch to Boston and way papers.

By the following Monday telegraphic facilities had been very generally restored, although one week after the storm its effect was still visible in the crippled telegraphic resources.

The destruction of the property of the companies is variously estimated at from \$200,000 to \$500,000, in addition to the consequential loss from suspension of the regular business.

The last great smash-up of our telegraphic system, and the only one approaching that of the 21st ult. in severity, occurred eight years ago—on Sunday the 5th of January, 1873. At that time telegraphic headquarters were transferred from this city to Jersey City, Weehawken and other neighboring points. That storm cost the telegraph companies \$50,000 for repairs; but, as that was prior to the invention of the telephone, and as the telegraphic system of that time can be in no wise compared to the present, the cost of repairs in 1873 forms no criterion of the damage done here in 1881.

#### The Postal Telegraph in Congress.

A few weeks ago nothing seemed more remote than the possibility of an American postal-telegraph scheme, but the gigantic telegraphic combination now talked of has, at last, afforded a seemingly strong argument to the admirers of this decidedly Imperialistic scheme. It is worthy of note that at the first session of the present Congress—nearly two years ago—an amendment to the army appropriation bill was passed authorizing telegrams to be transmitted by railroad companies owning or controlling telegraph lines which would file a written acceptance of the restrictions and obligations imposed by Title 65 of Revised Statutes (which relates to the construction of telegraph lines upon the public domain) for the government and the general public.

This, and similar measures were opposed by those who are adverse to increasing the power of the government. But, since the news of the consolidation, a great change of sentiment seems to have taken place, and there now appears to be a strong feeling that Congress should shield the people from the arbitrary dominion of a telegraphic monopoly.

Immediately upon the announcement of the scheme for consolidation, the House Post-office Committee resurrected the bill introduced on the 3d of last May, by Mr. Ellis, of Louisiana. This bill required the Postmaster-General, as an experiment, to establish by purchase or construction a telegraph line between Boston and Washington. The telegraphic offices at intermediate points were to be located in post-offices and the carriers employed to deliver messages, and postal telegraphic stamps for the prepayment of messages were provided for. A rate of 15 cents for 24 words for a distance of 200 miles was fixed in the bill, with one cent for each additional word; for 1,000 miles, 40 cents, with two cents for each additional word; 2,000 miles, 75 cents, with three cents for each additional word; 3,000 miles, \$1, with five cents for each additional word, and for distances less than 200 miles, where the message passed between two offices without passing through an intermediate office, the rate was fixed at 10 cents for 25 words, with one-half cent for each additional word. The committee has now referred it to a sub-committee.

On the 17th ultimo, two resolutions were introduced in the House of Representatives at Washington, both with a similar object. One of them, introduced by Mr. Springer, was referred to the Post-office Committee, which, on the 20th ultimo, resolved, by a vote of 7 to 1, to report it favorably to the House at the earliest opportunity. It reads as follows:

*Resolved*, That the Committee on Post-offices and Roads be instructed to inquire into the expediency of establishing by law a telegraphic postal system under the government of the United States, and also the cost of reproducing facilities of transmitting telegraphic messages equal to those now possessed by existing corporations, and as to the expense of operating the same, with power to send for persons and papers and report at any time by bill or otherwise.

This, of course, involves an investigation of the actual value of the property of the Western Union Telegraph Company and the cost of operating its line—a task which will be found exceedingly difficult.

On the 26th ult., the Post-office Committee reported to the House the bill recommending Postal Telegraphy, and it was “placed on the House calendar.” The committee recommended that the resolution be passed for the following reasons: “That it is evident to the committee that there is a general demand by the public for protection in telegraphic communications from the extortions of a great telegraphic monopoly that absorbs its competitors as they become established, and thus compels a tariff which pays dividends on stock believed to be largely watered, and therefore official inquiry should be made into the facts and legislation proposed in accordance therewith.”

The other resolution, introduced Jan. 17, by Mr. Ford, of Missouri, was more peremptory in tone, declaring it to be the opinion of the House that every interest demands the immediate construction of telegraph lines by the government, and instructing the Committee on Post-offices to report a bill for the construction of such lines as may be necessary to protect the people from monopoly. This resolution was, however, lost by a technical ruling of the Speaker.

The slow headway made by congress has disgusted a good many advocates of the government monopoly. When the “Springer resolution” was referred to the committee, the sentiment in Congress in favor of a system of government telegraph ran very high, and the sub-committee got everything in shape to push forward the work of preparing a suitable bill for immediate consideration; but when the resolution was reported back favorably, and the House failed to act on it at once, the enthusiasm became less warm, and the public now looks rather to private enterprise to redress their wrongs.

In view of the brief period allotted to the life of the present Congress, it is scarcely probable that any definite action can be taken before next Winter.

#### Death of A. G. Stohlbrand.

To the Editor of The Operator:

SIR: It is my sad duty to announce to fellow operators the death of Mr. A. G. Stohlbrand, which occurred in this city on Thursday, Jan. 20. Mr. Stohlbrand was a first-class operator—largely known among telegraphers throughout the United States. Although his age was but thirty-five he had filled many important positions. He commenced at Chicago under Mr. Swain. From there he went to New York and Philadelphia; was night manager at Philadelphia for the P. & A. Co.; afterward went to Albany, N. Y., for same company. Then went to Charleston, S. C., as manager for the Southern & Atlantic Co. He was afterward manager for Automatic Co., in Washington and New York. He returned to Chicago and accepted the managership of the A. & P. Co.'s office, where he was taken ill with hemorrhage of the lungs, four years ago. Through advice of his physician he went to Colorado, but realized no benefit from the change. From there he went to Santa Fe, N. M., with same result; thence to Los Angeles, Cal., where he stayed until about eighteen months ago, when he returned East against the advice of physicians, who told him that he would not live even to cross the mountains, but would bleed to death through lungs.

He has been employed in the Cincinnati office nearly one year. *Splendid courage* has kept him up, and that alone. It will be a long time ere the operators of the Cincinnati office will forget his tall, spare form, as they have seen him pause for the purpose of regaining his breath on each landing of the five flights of stairs which lead to our operating room. Many a heart has beat sorrowfully for the poor fellow under these circumstances, many here would have assisted him in his breathless condition if in their power. Amid all this distress, he was always cheerful, and manfully, uncomplainingly, worked away, even with the shadow of death over him, for he worked the Baltimore wire but last Saturday, 15th inst., only five days before his death. I suppose I need not add that his disease was consumption.

To his mourning wife and relatives I do not know what better words of comfort I can offer, in behalf of his many friends in the Cincinnati office, than these words from Bayard Taylor's “Death in Arabia”:

“Allah glorious! Allah good!  
Now thy word is understood;  
Now the long, long wonder ends!  
Yet ye weep, my erring friends,  
While the man whom ye call dead,  
In unspoken bliss, instead.  
Lives and loves you; lost 'tis true,  
By such light as shines for you;  
But in the light ye cannot see  
Of unfulfilled felicity—  
In enlarging paradise,  
Lives a life that never dies.”

CINCINNATI, O., Jan. 22, 1881.

W. F. B.

#### Another Vast Telegraphic Scheme.

On Wednesday, January 19, there was filed at Albany the certificate of association of “The American Telegraph and Cable Company.” This company is organized for the purpose of “owning, constructing, purchasing, leasing, or otherwise acquiring, using, operating, and maintaining a land and submarine line or lines of electric telegraph, partly within and partly without the limits of the State of New York.” The capital stock will be \$20,000,000, with power to increase the same to such amount as may be necessary to build and construct the lines of telegraph and cable contemplated by the company, and the term of the association is fixed for 50 years, from the 18th of January, 1881, to the 16th of January, 1930, and its head-quarters are to be in the City of New York. It is said to be a scheme by which, under the general management of General Eckert, there shall be established a grand telegraphic network extending around the world, with New York as its centre. It also proposes, with the co-operation of the consolidated Western Union Company, “not only to increase the existing cable facilities between this country and Europe and to extend southward the cables which now connect this country with Cuba and the West Indies, so as to secure for the great coffee trade of the United States a direct telegraphic communication with Brazil, but also to lay cables under the Pacific from San Francisco to Honolulu. From Honolulu one cable will be laid under the North Pacific to Japan, connecting there with the cable from Itoki to Shanghai, in China, and another under the South Pacific, by way of Ellice's Islands and the Friendly Isles, to New Caledonia, and thence to Brisbane, in Australia, where it will connect with the Australian and New Zealand cable system in one direction and with the Australian and Straits system in the other direction.”

If the government can be induced to grant the necessary subsidy, “a connection may be made from Vancouver's Island, by way of Alaska, with Petropaulowski, and thence with the north of Japan.” Under the new arrangements, also, “our telegraphic and cable communications with the west coast of Mexico, with Central America, and with South America will be pushed forward with great rapidity.”

#### The Telegraph in Baltimore.

To the Editor of The Operator:

SIR: The many readers of THE OPERATOR will be pleased to hear of its increased circulation here.

The American Rapid Co. opened on the 1st of January with a fair corps of operators and greatly reduced rates. It is patronized mostly by the different freight and express companies. Mr. W. Boggs is chief operator.

The A. & P. business is handled by Mr. W. H. Stewart, manager, who also attends to the financial interests of the fraternity, assisted by Messrs. Boyer, Glenn, Sampson and Frankenburg, at the main office. The city offices are manned by the following operators: Messrs. Greenwald, Beck and William Clark.

The large and flourishing commission house of Milmine, Bodman & Co. has leased wires from the American Union, connecting their of

ices with the Corn Exchange. Mr. E. O. Eastlake, late of the Western Union, is their operator.

The Board of Trade is still booming under the sagacious and efficient management of its chief, Mr. E. H. Cole, assisted by the amiable Dick Ganger, of W. U. fame.

The American Union has opened several new offices recently with Messrs. Cahill, Hogan, Lenz, Stayton and Van Witsen, the latter being the pioneer of the B. & O. Messrs. McKenna and Lenz are "owls."

Mr. F. M. Clark, of Peter Wright's private lines, has abandoned his quad and accepted a similar position with Mr. J. A. Hambleton, the well-known banker. The boys tip their hats and wish Finley bon voyage.

One of the finest wires in the city is operated by the Balto. Elevator Co., more familiarly known as the Canton elevators. It was started in 1875, and the large business done compelled the opening of a new office each year. The following gentlemen work the wire: Messrs. Caner, Scott, Hagarman and Dorsey, the latter being the senior operator. Two important features are that the company pays its force good salaries, and all the boys take THE OPERATOR. BALTIMORE, Jan. 20, 1881. EXCELSIOR.

### Indianapolis Items.

Since my last epistle, the fraternity in this city of concentric circles has been subject to several changes. The death of Chief Operator Langhorne, of the Western Union, has necessitated an advance in the line of promotion in that office. First Assistant Chief H. C. Sickles has been appointed chief; second assistant F. A. Moore takes Mr. Sickles' former place as first assistant, and our genial and good-natured friend, Joe M. Taylor, of the night force, has been transferred to Mr. Moore's former duties.

The hours in the W. U., commencing Jan. 1, have been subject to a revision. Half of the day force report at 7.30 A. M., and are relieved at 5.30 P. M. The other half report at 8 A. M., and are relieved at 6 P. M., allowing a half hour in the middle of the day for the usual diversion. By this arrangement the day men are relieved from 6 to 9 P. M. tri-weekly trick. The night force report at 6 P. M. and have no mid-day hour relief to work.

Two men have been added to the operating force, Messrs. Crull and Detrick. Mr. Crull was formerly train despatcher for the I. D. & S. R. R., in this city Mr. Detrick hails from Greencastle, Ind. At the American Union office there has been little change.

The A. & P. Co.'s business in this city is managed by Mr. A. E. Farnsworth and manipulated by Mr. Harry Smith, at the main office, and Mr. J. J. J. at the Chamber of Commerce branch office. They have closed the branch office at the Merchants' Exchange room.

At the different depot and headquarter offices there have been but few changes. Mr. Shirley, formerly assistant dispatcher on the Belt Railroad, has taken service with the I., B. & W., at their office in the Cleveland block.

Mr. Isgrigg, formerly with the I., B. & W. at Urbana, Ill., later with the I., D. & S. here, is whiling away a few days at J. P. Wiggins' branch office on Georgia street, during the absence of Miss Lou White, who is assisting Miss Clara Louisa Bottsford in her endeavors to be appointed state librarian.

### Chicago Notes.

To the Editor of The Operator:

SIR: There are no office changes to note this issue, no incomers of late, and the thrilling uncertainties consequent upon the present unsettled state of telegraphic affairs have had the effect of holding back the would-be outgoers, who are now sitting uneasily upon their chairs, waiting for more light ahead before deciding upon their next move. Even the periodical and "pay-day" revellers have looked out upon the winter weather and appeared unusually sober. The great sensation—the consolidation and its possible results—has been fully discussed during "let ups" and spare moments, and, so far, I believe, the hopeful predictions have outweighed those of a more depressing character.

The late movement to make "the monopoly" more invincible than ever seems to have brought

about an awakening among business and public men generally that can hardly fail of speedy and fruitful action; and therein lies our encouragement. Representatives of commerce and the press appear to comprehend the situation, and therein lies our confidence that the "spirit of American independence" will move in this broad land, and, perhaps, fill the air with so many wires that pigeons will not dare to fly. You have doubtless learned, through the press, of the organization of a new telegraph company by the leading solid men of this city. "Where there is so much smoke, there must be some fire."

The seventh annual reception and ball of the Chicago telegraphers will be held at Martine's Hall, West Side, on Thursday evening, Feb. 24, 1881. Invitations can be had on application to the Secretary, E. P. Whitford, Western Union Telegraph Company, Chicago. One hundred and fifty dollars have already been subscribed toward defraying expenses. The committee of arrangements will spare neither time, pains, nor money to make it the best social gathering ever given in this city by the fraternity.

CHICAGO, Ill., Jan. 23, 1881.

INEWRI.

### Pacific Telegraphers' Relief Association.

The annual meeting of the above association was held on January 9, in the manager's room, W. U. Telegraph office, San Francisco, President Leatch in the chair. The president's report showed the association to be in a flourishing condition, both the membership and the cash in bank having more than doubled during the past year. The association has not been called upon for relief by any of its members during the year, but a donation of \$10 was made to the family of a messenger whose father and mother died suddenly, leaving 3 young children unprovided for. The treasurer's report is as follows:

Cr.		
Jan. 1, 1880.—Cash on hand and in bank.....	\$231.96	
Jan. 1, 1881.—Receipts from monthly dues.....	236.47	
Dr.		\$468.43
To postage, printing and stationery....	\$9.50	} 29.50
" care burial plot one year.....	10.00	
" relief Toomey family.....	10.00	
Leaving a balance on hand of.....	\$438.93	

### Proposed Electrical Society in New York.

As there seems to be a desire among telegraphers in and around this city for an electrical society, the undersigned assume the responsibility of calling a meeting of all persons connected with the telegraph or telephone, interested in the subject, to be held at the United States Hotel, corner of Fulton and Water streets, New York, Feb. 8, 1881, at 8 P. M.

This meeting is intended to be merely a preliminary one, at which the practicability of forming a society may be discussed and plans for its formation decided upon.

P. J. Tierney, D. R. Downer,  
J. W. Moreland, E. T. Barberie,  
E. A. Leslie, F. W. Cushing,  
A. J. Creelman, John H. Dwight,  
J. B. Sabine, W. B. Waycott,  
Geo. F. Stainton.

### TELEPHONE DEPARTMENT.

Leadville, Colo., has now over 300 telephones in use.

The first public telephone line was laid down by the Berlin telegraph office on the 22d of December last.

The telephone line connecting Providence, R. I., and Boston and Lowell, Mass., has been completed. The length of the line from Boston to Providence is about fifty miles.

A meeting of the stockholders of the American Speaking Telephone Company was held in this city on the 20th ult., directors were chosen, and the following officers elected: George B. Prescott, President; Norvin Green, Vice-President; L. E. Lefferts, Secretary; R. H. Rochester, Treasurer.

Thomas Moody sued the Metropolitan Telephone and Telegraph Co. for \$1,000 damages for injuries sustained by his son, John F., by one of the company's iron gratings falling on the boy's leg. By consent of the defendant company a judgment for \$650 was entered against it.

In the disputed patent for a return wire or

"metallic circuit" for telephone use, the Commissioner of Patents has made his final decision in favor of David Brooks, the well-known inventor and authority in telegraphic matters, of Philadelphia, against A. G. Bell, of telephone fame.

On Sunday morning, the 16th ult., the telephone exchanges in Lewiston, Portland and Biddeford, Maine, were connected. The wire used was railroad wire, running via Brunswick, and the current, passing through relays in several offices, made the distance, equivalent to one hundred and twenty-five miles. The tones were very distinct in Portland, and conversation could be carried on with Biddeford, though the battery on that line was hardly sufficient. Manager Farnham, of Portland, conversed with ease with Messrs. Stauford and King, in the central office, in Lewiston.

The Lewiston, Maine, *Journal* says: An old gentleman with a big, spreading ear-trumpet came into the central office of the Telephone Exchange, Friday. He uncovered the horn and asked to see the Superintendent. Mr. King came forward and the stranger addressed him thus: "Mister, I've hearn consider'ble about this 'ere telephone business. I've been told they fix it so you can hear a person speak for 20 miles. Now I'm kinder hard of hearin' and I wish you would put the telephone rigging on my trumpet, so I can hear the parson preach Sundays." The old gentleman was as honest as could be about the matter, and it took Mr. King some time to make matters clear to him.

A telephone operator in this city, in answer to a question as to who uses the telephone most, says: "Almost everybody uses his telephone some time in the day, but the drug men, wholesale grocers, express men, steamboat men, stationers, printers and bookbinders use their instruments the most in this section. The fish dealers begin early in the morning, calling for dealers uptown and the hotels. Then as soon as the New Haven boat arrives twenty or more men are called for in succession to notify them that they have freight on board. Then come the express agents. They call all day long; and so do the steamboat and railroad agents. The retail druggists call for the wholesale druggists and order goods, and the wholesale grocers keep us busy all day. The stationers, printers, bookbinders, publishers and paper men seem to be calling every two or three minutes."

At Washington, on the 26th ult., the People's Telephone Company filed before the Examiner of the Patent Office, in the class of electricity, a brief on an application for a patent on an electric-speaking telephone for Daniel Drawbaugh, a shifless, though inventive genius of Cumberland County, Penna. A few days since the same company filed in the Circuit Court of the United States at New York an answer to an injunction and suit by the American Bell Telephone Company. The People's Telephone Company is an organization formed on the Drawbaugh invention, with several patents for improvements thrown in by the inventors as an equivalent for stock, or purchased outright, so that a perfect telephone can be made. The company has spent over \$50,000 so far, perfected a telephone, rented offices in New York, selected the factory, is ready to contract for the manufacture of telephones, wires and poles, and only awaits the issue of this injunction and suit or the issue of a patent from the Patent Office to Drawbaugh. This company has not sold a share of stock outside the original subscribers, and the stock is pooled in less than fifty names. It proposes to furnish telephones for less than half the charge made by the Bell Company, and decrease the charge as the plant is extended. At present, the Drawbaugh application for patent stands as rejected on two grounds. First, That patents have been granted to others prior to the date of Drawbaugh's application. Second, That telephones, acting and operating on similar principles, were in public use and on sale prior to Drawbaugh's application. The case comes forward now for rehearing on three questions of law. If Drawbaugh gets a patent then the patents of Bell, Edison and Gray fall to the ground, for it is claimed that Drawbaugh perfected and used the invention several years before either Bell, Edison or Gray applied for a patent.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, FEBRUARY 1, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### THE BOYCE FUND.

We shall be greatly indebted to agents of the Telegraphers' Mutual Benefit Association, or any of the members in the various districts, who will kindly interest themselves and will forward us, for publication in *THE OPERATOR*, the names of subscribers and the amount subscribed to the above fund. Any remittance to this office will be promptly turned over to Mr. J. N. Ashley, and acknowledged in these columns.

### THE GOVERNMENT AND THE TELEGRAPH.

The apparent collapse of everything worthy of the name of telegraphic competition has given new life to the old and decidedly un-American suggestion of a postal telegraphic system. It is a scare which, in the past week or two, has prompted the introduction into our national legislature of a number of new bills looking toward the establishment of such a service. The idea, which was started by Gardner G. Hubbard and others, has been gradually growing weaker during the past five years, since our cherished Constitution and traditions are all plainly opposed to a "paternal" form of government. It is an essentially American doctrine that the People in the aggregate can, without the aid of any political Moses and Aaron, right their own wrongs if they so choose, and that if they do not choose to do so they have no right to complain of the consequences. This would imply that our merchants and brokers can take care of themselves in the matter of providing capital for securing opposition to any kind of monopoly; but the helter-skelter style in which the People—though we ought now to drop the capital P—have fled to their government for protection would imply that they have surrendered this doctrine. The recent consolidation, and the ensuing but altogether unnecessary panic among telegraph patrons, have given the languishing postal-telegraphic scheme a new life, for if anything could accomplish that feat the late monopoly boom, of all things in the world, and seven or eight bills favoring postal telegraphy introduced or revived in congress in ten consecutive days, ought to do it. Our opposition thus far to governmental control of the wires has been based mainly on the supposition that there would always be at least two competing private companies; but, without joining in the general panic, we must admit that, since the marvelous "new deal" and consequent obliteration of all competition, we believe that one monopoly is no better than another; and, if we must choose between two evils, let us by all means

choose the lesser one, the government. That will, at least, remove the constant annoyance and hardship imposed upon both the public and the operators by the insincerity of "competing" companies, in whose protestations we have been guileless enough to believe, and the chaotic disturbances of a "consolidation" every twelve months or so. A system of politico-commercial-postal telegraphy will be bad enough for all, but far better than a single private company. We still hope that by the private pluck and enterprise which have made the name "American" famous, we may be saved from either a private or governmental monopoly, for we are satisfied that a proposition to extend the jurisdiction of the government to purely commercial affairs is repugnant to our institutions and the good sense and independence of the people of this continent. At the same time we must recognize the fact that the gross abuses of power by overgrown monopolies—which have already been substituted here for the "Barons" in the Old World, and which can only apparently be reached by the strong arm of the sovereign power—challenge us to so amend the powers of the administration that it shall no longer be confined to purely legislative affairs. These are dangerous doctrines, however, and a trifle un-republican; and, while self-preservation may be the first law of nature, we hope that the pregnant facts will not be lost sight of.

Meanwhile, if this postal-telegraph agitation is to continue, it will be to the interest of every telegrapher to urge an immediate reform of the civil service, a system now existing which should never be applied to the telegraphs. Men should be selected for their character and qualifications; appointed to office without political "indorsements;" be free from political assessments at election time, and kept in office and promoted for their ability and fidelity, irrespective of political turmoil.

THERE is at least one good result which will flow from the dispute in the Boyce case. It will lead the members to take more interest in their alleged insurance organization, and to provide better means for assuring the problematical one thousand dollars to their heirs. It has grown to be a great concern which, we have often thought, demanded the individual attention of at least one competent executive officer, who should be paid a fair salary. The time is certainly not far distant when—if the Second Division grows as we hope it will—such a directing officer will be absolutely necessary; but we shall be very much mistaken if the operators do not look at their hard-earned dollars a long time before paying them out for that kind of executive talent which decides that, because a fellow-member "coughed a good deal," he necessarily died of consumption—even when a physician swears that the patient died of some other disease—and that because an ill-starred and presumably friendless youth dies fifteen months after he is duly accepted and admitted, he must be stigmatized as a fraud, and his widow and children robbed of the benefits which he, in life, fondly imagined his thrift would bring to them. It would be well for members to send their proxies in future to persons other than incompetent officials when questions of this nature are to be considered.

WHEN the directors of the various companies looked out of their windows and saw the havoc wrought on their property by the storm of Jan. 21, and reflected on the possibility of \$300,000 in

the aggregate for repairs, together with the enormous consequential damages arising from a total suspension of their regular business, they doubtless admitted to themselves that it would be a capital idea to try the subterranean system of telegraphs. Frost contracting the wires, sleet sopping the foundations of the poles and old Boreas jogging along from the north-west at the rate of forty miles an hour are bad for overhead lines. To the artistic eye New York, on that memorable day, afforded a glorious Winter scene. The icy coating on wire and pole produced everywhere a forest of glimmering crystal, while myriads of icicles made some of the streets look like caves of stalactites. Then, like a transformation scene, the structure came down with a grand crash, and the picture which might have graced Fairyland itself lay in the streets a tangled and gnarled mass of splintered wood, iron and ice. The Arctic spectacle was completed by the irrepressible small boy—who, by the way, ever on mischief bent, enjoyed the confusion immensely, and gayed the overworked policeman into a state of frenzy—going to school in the suburbs on skates.

ON the 21st of February, 1878, Hon. William Orton, President of the Western Union Telegraph Company, insured his life for \$5,000, in the Connecticut Mutual Life Insurance Company, and on the 22d of April—two months afterward—he died. That insurance company, like some of the members of the T. M. B. A., forgetting that "in the midst of life we are in death," disputed the claim with the orphan children of Mr. Orton, intimating that he died "too soon" after his admission. Public sentiment not only showed its disgust for this kind of "insurance" but the Court, on the 21 ult., sat down heavily upon it, and awarded to the children of Mr. Orton \$5,000, with \$767.91 added as interest \$5,767.91 in all. We commend this piece of news to the "managers" of the Telegraphers' Mutual Benefit Association, with the additional reminder that John G. Boyce was accepted by them in August, 1876, paid his regular assessments for fifteen months, and died in November, 1877. His widow was also assessed two dollars after he died, which she paid in good faith. Mr. Orton was insured two months before he died, but the Court has promptly shown its detestation of this principle of stealing the pennies from dead men's eyes. Mr. Boyce's claim of \$1,000, with legal interest for three years and three months, now amounts in round numbers to \$1,207.

OUR esteemed contemporary, the *Journal of the Telegraph*, makes an earnest, eloquent and final appeal in behalf of the Second Division of the Telegraphers' Mutual Benefit Association. But eloquence must fall very flat on a body of men who understand that the chances are about even that a dispute will be raised, after their death, with the widow and fatherless children. Let these men attend to the First Division before they attempt a Second Division, and let them pay the Boyce claim in an honorable way. Then, while enforcing the most stringent measures for keeping out bad risks, let it be distinctly understood that, when once a certificate has been granted to an operator and he hobbles up on his crutches to pay his assessments for fifteen months, and after his death his poor widow is assessed two dollars which she sorely needs for food and kindling wood, his claim is a valid one. This would create confidence in the First Divi-

sion, and then it will be time enough to start a Second Division boom.

As the present generation of telegraphers and firemen are familiar only with the little electrical contrivances for fire alarms, it may not be out of place to take them to an old "look-out," nearly in ruins. At 3 o'clock on Sunday morning a sharp wind whistled through the iron stairway railing, and hummed beneath the wide-mouthed bell of the Spring street tower. It was bitterly cold ascending from the streets, above the house-tops, and away up into the fireman's eyrie. As the circuitous path up the steps brought the observer to face with every point of the city, a singular scene presented itself. All was so still and dark; the rivers silently rippling like a silver belt around the city, the bleak-like houses isolated on the Jersey shore, the snow-clad sides of the Palisades standing out clear against the heavy, threatening clouds, and, within all, the compact mass of densely-crowded houses. Within the little tower the night watchman untiringly kept his vigil, walked with an unceasing regularity around the narrow room, his eye scanning the surface of roof tops and chimneys, in search of an unusual glare or suspicious smoke. The duty was all absorbing, and no one dared distract his attention from a vigilance, the lapse from which might involve immense destruction. An old fireman's heart had been made glad by this sudden step backward of human progress. He was put at his old occupation of thirty years ago, before the telegraph and the telephone, and all other new-fangled notions had rendered his dear old watch-tower superfluous. To the untrained eye the thousand and one volumes of curling smoke seemed to indicate fire everywhere, but to the veteran fireman, as his keen eye swept over the city, everything was clear. He said that when first returning to this duty, after being "out of practice" for a quarter of a century or so, he experienced a little difficulty, the face of the city had altered so much; but when it was a part of his routine, he could recognize almost every wreath of smoke that daily rose from thousands of smoke stacks. So, even in its temporary loss, does the wonderful telegraph teach us "What God hath wrought."

MR. P. B. DELANY is not only a genius in the way of inventions, but he also wields a powerful quill, and we have been much gratified to see him hold his end up so skilfully during the past week in the columns of the *New York Herald*. That paper seemed to be laboring under the impression that Judge Blatchford's decision in the Page patent case secures to the Western Union exclusive control of the Morse telegraph in this country; but Mr. Delany, in his own quiet, lucid style, soon set the *Herald* right, concluding his letter as follows: "This (the Delany patent) will necessarily form the nucleus of all future competition to the Western Union Company, and already efficient measures are being perfected which will result in the establishment of lines throughout the country, the ownership of which will be so vested as to prevent consolidations or alliances with the would-be monopoly." Mr. Delany has a quiet, modest way of doing things, but they reckon ill who leave him out.

THE very marked increase in the circulation of THE OPERATOR is beginning to have its effect upon our advertising patronage. In addition to the usual announcements of telegraphic and electrical manufacturers and the like, we to-day publish advertisements of several houses in other

lines of business. We hope our readers will find in the articles offered something which they need and, by sending in their order and mentioning THE OPERATOR, demonstrate to our new advertisers that the paper has a large circulation, and that it will be to their advantage to let its readers know what they have to sell. We will consider it a great favor if our readers, in writing to an advertiser, telegraphic or non-telegraphic, will *always* say that they saw the advertisement in THE OPERATOR.

ALREADY the hard times seem to have struck the "Professors" who make a business of teaching the doubtfully remunerative art of telegraphy. Mr. William Worth, an account of whose hurried flight will be found in another column, evidently believes in taking time by the forelock, striking while the iron is hot, etc., and has consequently left many sorrowing students behind him, whose cash he had collected in advance. There is a good deal of uncertainty and more sarcasm in the *World's* dispatch, which says that Worth is a swindling telegrapher who has "operated" all over the country. Our own impression is that Mr. Worth has "operated" more with the pick and shovel than with the mystic key.

MR. J. D. ROBERTS, of Brooklyn, N. Y., desires to study the science of electricity, but finds the mass of books on the subject so large and varied that he is wholly at a loss where to begin, and asks our advice what to study in order to obtain the greatest possible amount of practical information in the least time. The best work we can recommend is "Pope's Modern Practice of the Electric Telegraph;" price, \$2. There are several other books, but this is, in our opinion, the best one to commence with. Of course, this or any other book can be ordered of us, and will be mailed, prepaid, on receipt of the price.

IN announcing in our last issue that appropriations for space at the International Exhibition of Electricity—to be held at Paris, between Aug. 1 and Nov. 15 next—will be received until March 31, we omitted to state that diplomas and medals will be accorded by a jury. All communications relative to the exhibition must be sent to "Le Commissaire Général de l'Exposition Internationale d'Électricité, Palais des Champs-Élysées, porte No. IV., à Paris, France." No charge will be made for space.

FOR ten years, operators in England have been "classified," but they have recently petitioned the Postmaster General for the abolition of classification. The petition prayed, also, for a number of other improvements in the service, including a clause asking "that three weeks' annual leave of absence be granted to all 'clerks' receiving 16s. to 40s. per week, and one calendar month to those receiving more than that amount." The Postmaster General declined to receive the deputation.

THE friends of the new scheme of monopoly assert that it will lead to an improvement in the condition of the telegraphic service of the country, and of the operators in general. The concentration under one system of the forces now employed in keeping up three systems will certainly enable the Consolidation to reduce its expenses greatly, but the story that it will help the operators' condition in any way is one which could be more appropriately told to the marines.

DISPATCHES from Canada intimate that the

Dominion Government desires to assume control of all the Canadian telegraph lines. It now enjoys the luxury of a superintendent of government telegraphs, owns a regular cable steamer, and only a few months ago laid several cable lines between the north and south shores of the gulf of St. Lawrence, the Island of Anticosti, Cape Breton and the Magdalen Islands.

THE latest "arrangement" in the way of a monopoly is between the various Atlantic cable companies. This contract contravenes, of course, the terms upon which the French company was permitted to land its cables on our shores, as it was expressly agreed that consolidation with any other company would nullify all its privileges here. But the small matter of a legal prohibition counts for very little nowadays.

THE great proportion of expert and reliable operators in the South are well represented by Mr. William D. West, whose portrait we reproduce in our columns to-day. Mr. West is deservedly popular with the working members of the profession, North and South, and is highly esteemed by the officers of the Western Union Company.

LORD JOHN LENHART has not said much since the new deal. Can it be possible that the noble lord has been swamped? But, still, "It may be best, just in the happiest, sunniest hour of all the voyage, while eager winds are kissing every sail, to dash against the unseen rock, and in an instant hear the billows roar above a sunken ship."

Do coming events cast their shadows before? What does our esteemed and scientific, though somewhat tardy, contemporary, the *Journal of the Telegraph*, mean by printing, in its last issue, the name of "United States of America" in its "Table showing the extent of Government Telegraphs in various countries?"

THE coming fortnight includes the anniversaries of the deaths of two men renowned in the history of electrical science. The illustrious Galvani died February 5, 1799, and Dr. Joseph Priestly, the eminent scientist and friend of Franklin, died February 6, 1804.

NEXT Friday will be the eleventh anniversary of the transfer of the telegraph in England to the government. The "Telegraph Act" was passed July 31, 1868, but it took until Feb. 4, 1870 (two years), to complete the transfer.

OWING to the pressure on our columns, in consequence of the great developments of the past few weeks, a number of interesting articles, personal and general, have been left over for some future issue.

A merchant can now be connected through the telephone exchange with a neighboring restaurant, and, by ordering his meal in that manner, continue working in his office while his steak is being cooked.

THE rumor that the Prince of Wales would preside over the Congress of Electricians, at Paris, is declared incorrect.

MR. J. A. WURZBURG, of the W. U. office, is Chicago agent for THE OPERATOR and for the books we publish.

WESTERN UNION stock is quoted at 118, A. U. at 84 $\frac{7}{8}$  and A. & P. at 48 $\frac{1}{2}$ . Last issue they were 101 $\frac{5}{8}$ , 90 and 47, respectively.

### Notes and Queries on Electricity and Electro-Magnetism and their Applications.

Practical as far as possible ;  
Theoretical as far as necessary.

BY T. D. LOCKWOOD.

#### Q. 83. What is the Wheatstone bridge?

A. The Wheatstone bridge, though usually classed with galvanometers, and explained under that head by most of the text books on electricity, is, strictly speaking, not a galvanometer, but a system of measurement; or, an arrangement of circuits whereby a galvanometer can be most advantageously employed. It was discovered by Christie, and described by him in the *Philosophical Magazine*, in 1836. But it was not much noticed or used until introduced by Wheatstone, in 1843, in a paper forwarded to the Royal Society, describing several new instruments for electrical measurements. Although previously described by Christie, it is almost universally known as Wheatstone's bridge, or balance. It is usually represented in diagram with the wires arranged in the form of a lozenge. The lozenge is composed of four wires which, for convenience, we will call A, B, C and D. Two of the opposite corners of the lozenge are connected by a wire with a galvanometer in circuit, and the other two opposite corners are respectively connected to the two poles of a battery. The two wires which converge to a point at the left hand we will call A, and B, and the two that converge to the right hand we will call C, and D. Fixed resistances are inserted in the branches A and B, an adjustable resistance in the branch C, and the resistance to be measured in the branch D. When all of the resistances are equal and the battery circuit is closed, the galvanometer on the cross wire will not be affected; because, as all electrical currents are caused by a difference of potential, and the two points connected by the galvanometer are under those circumstances, at the same potential, it is obvious that no current will pass through the cross wire and galvanometer, there being no force tending to cause a current therein. Again when branch A bears the same proportion to B that C does to D, no current will pass on the cross wire; because the battery current having divided at the point of divergence of the wires A and B in inverse proportion to the several resistances of those branches, that proportion of the current which is on each branch, on arriving at the crossing point of the bridge, will still be at the same potential. But if the resistance A does not bear the same proportion to B that C does to D, the needle will be strongly deflected. Hence it will be readily seen that unknown resistances can be accurately measured by inserting them, for example, in the branch D, and varying the other resistances—chiefly that in the branch C—until the needle stands at zero. The proper proportion is now restored, and the unknown resistance is ascertained by a simple calculation in proportion, or the rule of three. For instance, we will suppose that in A we have a resistance of 10 ohms; in B, 100 ohms. We then insert our unknown resistance in D, and a rheostat, or resistance box, in C. When we close the battery circuit, the needle deflects. We then vary the resistance in the box until the needle remains at zero. To obtain this result we have unplugged 200 ohms. Therefore, as 100 is to 10, so is 200 to 20—the resistance required. This is merely given as an illustration of the system. In practice, to measure a resistance within the range of the rheostat, the resistances in the branches A and B are made equal, because when they are equal the galvanometer is most sensitive. But, as it will readily be seen from the foregoing example, resistances both of extremely great and extremely small magnitudes can be measured by this system.

The bridge apparatus generally embraces a rheostat and galvanometer with two keys, one to make and break the battery circuit; the other to make and break the bridge wire. The rheostat is made with the branches A and B, each consisting of three coils—10 100, and 1000 ohms respectively: the arm C is a set of coils, varying from 1 to 4,000 or 5,000 ohms; while the arm D is provided with two building posts for the reception of the resistance to be measured. Circuits which only have one end within reach can be measured by putting one pole of the battery to earth, the branch C also to earth, and extending the branch D to the circuit to be measured, which must also be grounded at the distant end. In using this apparatus, and the resistance to be measured is approximately known, the proper plugs must be first taken out of A and B. The battery key should first be pressed, then the galvanometer key, making very short contacts with the latter, until the needle is nearly balanced. When the balance is obtained, it should be ascertained whether or not the needle will remain steady when the contact is made and broken.

Almost any good galvanometer can be used with the bridge system of measurement. The bridge is not now exclusively used for measurements, but has been utilized also in duplex telegraphy, and in the construction of sensitive burglar alarm telegraphs.

#### Q. 84. What is meant by the "constant" of a galvanometer?

A. The constant of a galvanometer means simply the deflection of the galvanometer needle, obtained through a standard resistance by a standard battery. The expression is used more frequently in England than in America; and there, as explained by Kempe, the term "constant" is applied to "the product of the deflection in degrees, and the resistance in ohms, when multiplied together. For example: With a battery, a galvanometer and a resistance of 1,000 ohms in circuit, a deflection of 20 degrees was obtained. The 1,000 is then multiplied by the 20, and the product, 20,000, is called the constant."

If wires are to be tested, the constant is first taken, as above, after which the wires are inserted in circuit, one by one. To obtain the results in ohms, the constant is divided by the deflection obtained from each.

#### Q. 85. What is a rheostat? To what apparatus is the name now applied? How is it used?

A. The name rheostat was originally given by Wheatstone to an instrument devised by himself for the purpose of varying at will the amount of resistance in a circuit.

Two cylinders, one of metal and the other of some non-conducting material, were arranged near each other, so that a fine German silver wire could be rolled and unrolled from one to the other, the resistance of the wire being known.

When the fine wire was all rolled on the metal cylinder it had no appreciable resistance, as the current would travel through the mass of the roller; but, when the wire was wound on the wooden, or rubber, cylinder in grooves prepared for it, the current was forced to pass through the entire length of the wire unrolled. By this means resistance was added or taken from the circuit. This apparatus is now scarcely ever used, but the name survives, and at the present day when we speak of a rheostat we mean a set of standard resistance coils, arranged together in a box and used for electrical measurements. Coils of wire, varying in resistance, for instance, from one-tenth of an ohm to five thousand ohms, are arranged in a box, their terminal wires being permanently connected together by a series of stout brass plates on the ebonite cover of the box. Conical brass plugs, inserted between the brass plates, serve to throw the coils in and out of circuit.

When all the plugs are in, and the resistance-box is in circuit, the current takes the short path through the brass plates and the plugs; but when any plug is withdrawn the short route between the two brass plates which that particular plug connected is broken, and the current is consequently forced through the coil below, and the resistance of that coil is added to the circuit. It will thus be seen that, by varying the arrangement of the plugs, the resistance may also be varied almost indefinitely. In making a box of resistance coils, thick wire should be used for the small

resistances, for two reasons: first, they are easier to adjust; and secondly, they are less likely to become deranged by powerful currents.

The wire used must be of some metal which is not easily affected by changes of temperature. German silver is generally used.

The wire is insulated by two coatings of silk, and is wound double, so as to eliminate self-induction, and also that it may not affect galvanometers in its vicinity. When coiled, the bobbins are soaked in melted paraffine, which maintains their insulation. The high resistances are made of fine wire, in order to economize space.

The following precautions are necessary in using resistance coils: Keep the brass plugs clean and bright; because, if dirty, they will not entirely cut out the coils. When a plug is inserted, do not simply push it in the hole, but give it a twist, and thereby insure good contact. Before commencing to use a rheostat give all the plugs a twist, to be sure that none of them are loose; and, finally, touch the brass plugs as little as possible with the fingers.

#### Q. 86. Give some simple method of measuring resistance.

A. The earliest method of measuring resistances was by using a common galvanometer multiplier, or a sine or tangent galvanometer, to place the resistance to be measured in circuit alternately with a standard resistance. If the deflection remained the same, in both cases, it was assumed that the resistances were equal. The difficulty in this method was that the electromotive force and internal resistance of the battery were supposed to remain constant, a condition which they rarely fulfill. The desire of obviating this difficulty was the cause of the introduction of the differential galvanometer and Wheatstone bridge—in both of which instruments the result is attained, irrespective of battery variation. The differential method was much used by Becquerel and others at one time, but it is entirely superseded in England by the bridge method. In the United States, the method that happens to be most convenient at the time is generally used. As the rheostat is now often made with a switch that can be instantly moved from the standard resistance to the resistance which is to be measured, the objection to the substitution method is substantially removed.

To measure resistance by any ordinary galvanometer, using resistance coils, we must first connect up the galvanometer in circuit with the resistance to be measured and a battery sufficient to produce a good deflection. Note the deflection produced, then substitute the rheostat for the unknown resistance, and unplug resistance until the needle shows the same deflection as before. Add the figures on the holes unplugged, and we have the required resistance. If we use the rheostat provided with the switch, all we have to do is to throw over the switch, and we can verify the result by moving the switch quickly a number of times. If the needle stands still at the same deflection, whichever side the switch rests, the result is correct. In using a differential galvanometer, we connect the rheostat on one side and the unknown resistance on the other, and vary the resistance in the rheostat until the needle stands at zero. The resistance unplugged equals the resistance required.

In using the Wheatstone bridge system, the unknown resistance is inserted in the side of the bridge, opposite to the variable resistance. If we have any idea what the resistance to be measured should be, we first unplug equal resistances on the first two sides of the bridge, each as near to the unknown resistance as may be. We then unplug resistance on the third side, until the needle remains at zero, when the battery key is pressed down. The resistance unplugged from the comparison coils then equals the resistance required. For example: We have a bridge system, the first and second branches of which each possess resistance coils of ten, one hundred, and one thousand ohms, any, or all of which, may be unplugged at will; the third branch has a series of coils, from one to four thousand ohms, and the fourth has binding posts for the insertion of the resistance to be measured. This resistance we supposed to be about four hundred ohms. The one hundred ohm coils in branches one and two being the nearest figures to the supposed resistance, we unplug them; and, pressing the battery key, find that the needle violently deflects. We then unplug four hun-

dred ohms on branch three, and again press the battery key, when we find that the needle still deflects slightly. We unplug fifty ohms more, and find the needle has now passed the zero point, and deflects to the opposite side, showing that we have unplugged too much. We replace the fifty ohm plug and draw twenty. The needle will now, perhaps, stand at zero when the key is pressed, showing that the resistance required is four hundred and twenty ohms. The reason for withdrawing the hundred ohm coils on the first and second branches is that the galvanometer is most sensitive when all the branches are equal. It is, therefore, as sensitive as possible when the branches are as nearly equal as possible.

When we measure the resistance of a wire, the distant end of which is to earth, we join the near end of the wire to the terminal of branch four, put one end of the battery to earth, and also put the terminal of branch three to earth, and proceed as before.

Q. 87. How may three parallel wires be measured without using an earth?

A. Call the wires 1, 2 and 3. The resistance of each is required; 1 and 2 are connected at the distant end, and the loop measured, the result being, we will say, 300 ohms. We then connect 1 and 3 at the distant end, and, measuring, find the result to be 600 ohms. Lastly, we loop 2 and 3, and, measuring again, find the resistance to be 700 ohms. To get the resistance of No. 1, we add the first two results together—the 300 and the 600 ohms—the sum being 900, which is obviously the sum of the resistances of all the wires; the first being doubled, as it was measured twice. We then subtract the third results from the sum so obtained, deducting 700—the amount of resistance of Nos. 2 and 3—from 900, and find the remainder to be 200. This, divided by 2, because No. 1 was twice measured, gives us 100 ohms as the resistance of No. 1. The resistance of No. 2 is ascertained similarly; that is, by adding the first and third result, subtracting the second and dividing by two; and is then found to be 200 ohms. The resistance of No. 3 is ascertained by adding the second and third results, subtracting the first from the sum, and dividing by 2, leaving the result 500 ohms. That these final results are correct may, of course, be readily proved by adding these together.

#### Induction on Telephone Lines.

To the Editor of The Operator:

SIR: I have carefully read the letter of Mr. T. D. Lockwood, which appeared in your last edition. His explanation agrees with my idea of induction in every particular, but I think the so-called induction can be overcome by other means than a metallic circuit. After having observed the different characteristics of induction, I have something which will, at least furnish better insulation. My idea is as follows: The insulator and pin are put on as usual, with the exception that a piece of No. 8 wire is run up through the centre of the pin, one end of which touches the inside of the top of the insulator, the other end being fastened to a common ground-plate. A piece of rubber tubing, such as is usually used for the prevention of "singing" is fastened to the insulator by a wire passing through its centre. The line wire is then connected to the rubber in the same way as is usual on an insulator.

JAS. J. O'NEIL.

BOSTON, Mass., Jan. 18, 1881.

#### DASHES HERE AND THERE.

Between Melbourne, Australia, and London, England, a telegram passes over 13,695 miles of wire.

The Kansas City Electrical Society has been organized at Kansas City, with Mr. W. H. Woodring as president.

Another sled ran into a telegraph pole at Girardville, Pa., last week, and Honora Dougherty and Mary Carduff were instantly killed.

Salicylica, advertised in this issue, is highly recommended for the cure of rheumatism and also in the treatment of telegraphers' paralysis.

The Duke of Northumberland intends to introduce the electric light at Alnwick Castle, and if successful it will, no doubt, be used in other English houses.

Professor Graham Bell is said to have discovered that melted sulphur acts similarly to selenium with respect to electricity, but only at a temperature below which it becomes viscid.

In consequence of the disastrous effects of the storm on the telegraph wires, the St. Paul (Minn.) Pioneer-Press received some of its New York news a week last Friday night by way of New Orleans.

The news of the election of Gen. Garfield reached Santiago, Chili, on the 4th of November, two days after the election. The dispatch went via England to South America, thence across the Andes to Montevideo and thence to Santiago.

According to a London journal, the orange specks of the gaslights along the Thames embankment were seen to shine dimly through a recent fog while the brilliant white glare of the electric lamps was indistinguishable.

Liverpool, England, has decided to adopt the electric light at a portion of the new dock system at the north end of the city, at an estimated cost of \$10,000. This is to be an experiment, and upon the result will depend the extension of the light over the docks generally.

The *Student's Journal*, published by Andrew J. Graham, 744 Broadway, New York, is a handsome sixteen-page paper, devoted to the Graham system of stenography, and will be found of great value to those familiar with the Graham system. The subscription is \$2 a year.

The electric belts advertised in the present issue by the Electric Appliance Company, No. 2 Bond street, this city, are very highly spoken of by physicians and those who have used them. The company forwards free, on application, a catalogue giving an immense number of testimonials.

The World Manufacturing Company are not unknown to many of our readers, although this is the first occasion on which they have inserted an advertisement in THE OPERATOR. Their goods have a large sale because they are what the public want and sold at a low price. The company offers liberal inducements to agents.

Nature says that an electric cable manufacturing firm in Neuchatel has made a highly important discovery in practical telegraphy. After a long and expensive series of experiments, they have succeeded in devising a method of laying cables whereby the induction of the electric current from one wire to another, although the wires are in juxtaposition, is prevented.

According to the Chicago papers, that progressive city is to be made thief-proof by a greatly extended system of police alarms. The central station is to be made a complete telegraphic exchange; the city is to be divided into telephone alarm districts—horses, wagons, and men in readiness being stationed at a central point in each district.

One of the officers of the steamship City of Berlin states that he has received the current from a Siemens' dynamo-electric machine through the legs, trunk, left arm, thumb and one finger. He says he did not like the sensation, but that he could have endured it if necessary, although the current was capable of giving four lights of 400 candle-power each.

The severest sleet-storm ever known in Eastern Nova Scotia occurred on Sunday and Monday, the 16th and 17th insts. The W. U. lines were prostrated for about fifty miles, ice forming on the wires from one to three inches. Communication with the West was interrupted from Sunday until Wednesday evening, the longest break ever known on that section.

The case of the Western Union against the Pennsylvania Railroad, in the matter of the removal of the telegraph company's wires from the railroad, came up in the United States Court, at Philadelphia, on the 17th ult., but argument was postponed until the following Monday (24th). On that day argument was resumed, and completed on the 26th ult., when the judge announced that he would reserve his decision.

Mr. C. J. Kintner, of the United States Patent Office, believes that, judging from what has already been done in various applications of electricity, within the next decade we shall find our large telegraphic corporations operating their elevators, supplying motive power, heat and light throughout their buildings, and electricity for their lines from one common source of power.

A cable-laying ship possibly represents the highest development of marine engineering, for a hitch in the machinery may mean the failure of the expedition. An instance of the perfection to which we have reached is furnished by the cable-ship Kangaroo, which ran recently from New Zealand to St. Vincent without once stopping the engines. The distance of 9,500 miles, supposing about sixteen miles to be run every hour, represents continuous work for twenty-five days—a fairly sufficient testimonial to the excellence of the machinery.

The electric light is rapidly becoming popular in this city. The firm of Fisk & Hatch, which has been paying \$250 per month for gas, is now obtaining far more satisfaction from the Maxim light for about the same amount of money. The Brush Company have just completed a circuit of three miles, which they claim to be the largest circuit yet put into operation by any company. Lamps have been put up along Broadway from Twenty-sixth to Thirty-fourth streets, and they have now thirty-one lights on their "all-night" circuit, twenty-three street lamps and eight private ones.

On the 15th ult. an American District messenger was arrested in this city for stealing a ride on a street car. The lad said that he received ten cents to pay his car fare, but as he "had to divide with the clerk in the office" of the company, he could only ride one way, and was stealing a ride in order to make his trip in time. While the boy was in the hands of the police, the District company sent for his uniform. The police captain would not allow the boy to be stripped, and his parents refused to give up the uniform, which they said they had paid for. The child, who is only 13 years old, worked from 7 A. M. until 10 P. M. without extra pay.

A dispatch from Boston to the *World*, on the 16th ult., says: "William Worth, a young man with several aliases, was arrested here to-day for swindling persons who were seeking a knowledge of telegraphy. It is charged that he has operated all over the country, and that about three months ago hastily decamped from Providence, leaving behind him a large class of young ladies, who had paid their tuition fees in advance. A few months ago Worth opened a school on Tremont street, where he had a large class, but failing to fulfil his promises the students communicated with the police."

The typical small boy of Paterson, New Jersey, has now an abiding faith in the stability of the telegraph lines recently constructed. On the 17th ult. five of these festive youths rode a sled down hill, at a speed of nearly a mile a minute, and brought up suddenly against a telegraph pole. Result: One nose and one jaw broken—this particular victim leaving a fine impression of his upper row of teeth in the pole; nose No. 2 badly smashed; one thigh broken, two legs ditto, and other thankless favors evenly distributed among the five sportsmen, in addition to the shivering of the sled into kindling wood. The telegraph pole still stands there, pointing the cross-arm of scorn at weak humanity.

The annual meeting of the Gold and Stock Life Insurance Company was held in the Western Union Building on the 10th ultimo. The following officers were elected for the ensuing year: President, M. Breslin; Vice-President, D. E. Pike; Treasurer, Ralph W. Pope; Secretary, C. H. Small; Executive Committee, W. H. Collins, C. Wenkel, D. J. Ludwig. The reports of the Secretary and Treasurer show the financial affairs of this Association to be in a highly satisfactory condition. As they have suffered but three losses since the formation of the Association, they are accumulating quite a surplus. It was established on an original principle, and its pronounced success must be very gratifying to the members. Several members gave notice of proposed amendments to the constitution, and the meeting adjourned to meet Saturday, Jan. 31, for revision of the constitution.

On the 12th ult., at London, the French Cable Company approved "an arrangement"—that is all the cable said—with the Anglo-American and the Direct United States companies. Both the latter companies ratified the "arrangement" on the 14th ult.

The parties to this arrangement are understood to be the Direct Cable Company, the Anglo-American Cable Company (with its adjunct, the Erlan-

ger, or old French cable), and the new French line, the Compagnie Generale du Telegraphie de Paris à New York. The latter company, since its establishment a year ago, has honestly competed against the other two companies, which have for a long time been worked together under a pooling arrangement. The division of the receipts is, it is said, to be in this proportion: The Anglo-American Company is to receive sixty-one per cent. of the gross receipts of all the lines, the Direct Cable Company twenty-three per cent., and the French Cable Company sixteen per cent. Each company is to contribute *pro rata* to the joint working expenses, which will include the necessary construction fund, since the average life of a cable is less than ten years. These companies control the whole Atlantic cable system, the Erlanger, the original French competing company, having been absorbed by the Anglo-American several years ago.

## PERSONAL.

J. S. Nearman, of Chenango, N. Y., has been appointed agent at Hilliard, on the S. & A. R. R.

An assessment of one dollar is made by the T. M. B. A., on the death of Anthony Hedley, at Albany, N. Y.

Miss Belle A. Hall, late of the St. Joseph, Mo., A. U. office, has been transferred to the A. U. office at Iowa City, Iowa.

Mr. S. E. Kirke has been appointed agent for the P. D. & E. Railway, at Pekin, Ill. Mr. S. M. Russom relieves Mr. Kirk at Havana, Ill.

The board of trustees of the Brush Electric Light Company gave a reception to Mr. Charles F. Brush, at the Gilsey House, on the 15th ult.

Lawrence Sheridan, the night messenger of the Western Union at Newark, N. J., was attacked by two footpads on the night of the 15th ult., but gallantly put them to flight with his pistol.

James P. Hart, a messenger employed in the Portland, Me., A. U. office, in alighting from a train, January 15, slipped on the ice and the wheels passed over him, killing him instantly.

Mr. C. W. Hurlburt, of North Sydney, C. B., has been called to his home at Delaware, Ont., on account of the death of his mother. The many friends of Mr. Hurlburt deeply sympathize with him in his affliction.

At Philadelphia, on the 12th ult., on motion of Hon. F. Carroll Brewster, Samuel A. Boyle, Esq., was admitted to practice in the Supreme Court. Mr. Boyle was for many years an operator for the Western Union Company.

Mr. Fawcett, the English Postmaster General, who has been staying during the Christmas holidays at Trinity-hall, Cambridge, sent for the telegraph messenger boys at the Cambridge Post-office on "Boxing-day" and gave each of them a small sum as a Christmas present.

We learn from the Lafayette (Ind.) Journal that Mr. Will A. Gibson, the genial and clever Western Union Associated Press reporter, has severed his connection with that office and assumed new duties in the office of the auditor of the Lake Erie & Western Railway.

Mr. Robert Eggleston, formerly agent and operator for the D., L. & N. R. R. Co., at Belding, Mich., has, on account of poor health, been obliged to resign his position. He leaves in a few days for New Mexico to accept a situation on the A., T. & S. F. R. R.

Will some of the readers of the OPERATOR please inform me of the address of J. H. Dunlap, train-dispatcher on the C. P. R. R., P. B., in 1879; formerly from Monton, N. B. His address will be thankfully received by J. L. Conners, N. W. Tel. office, Winnipeg, Manitoba.

Mr. Wm. H. Huff, ticket agent and operator at Mt. Holly, N. J., has accepted a position at Camden, N. J., as train dispatcher and operator for the Penna. R. R. Co. Mr. J. L. P. Eckman has been appointed day operator and ticket agent at Mt. Holly, with Mr. J. S. Baugh as night operator.

Dr. Orazio Lugo, a pupil of Professor Henry, and an electrician, who for the last fifteen years has been experimenting with dynamo-electric machines, has recently taken out several patents for improvements in these machines. Mr. Stephen D. Field denies that there is anything new in Doctor Lugo's researches.

Mr. Geo. V. B. Frost was chosen general superintendent of the Mutual District Messenger Company of this city, limited, at the last meeting of the board of directors of that company, and has entered upon his duties. It will be remembered that Mr. Frost has been for the last eight years with the American District Telegraph Company. His long experience in that branch of public service has gained him many friends, and will be of great value to him in the detail work of this new company.

PHILADELPHIA.—Mr. W. D. Black, late of the Western Union main office, has accepted a position with the American Union at No. 30 South Third street. Mr. Charles Moore has taken charge of the A. U. office at the Stock Exchange, relieving Mr. Dillon, transferred to the main office. Mr. George L. Sparks, night manager of the American Union office at the Continental Hotel, has resigned to take charge of American Union affairs in Camden, N. J. Mr. L. E. C. Moore, of the Western Union, has taken the position lately occupied by Mr. Sparks.

KANSAS CITY, MO.—Mr. W. H. Patton, extra for W. U., has resigned. Mr. Matson, from the West, is here. He puts down a magnificent copy. Mr. Eccles, all-night man, also takes A. & P. report aside from his regular trick. Business is pretty lively of late, the wires from Chicago all being down to the West. E. H. McGinty, who has been working for the A. U., has resigned. The boys are feeling blue over the consolidation.

Richard S. O'Brien, a lineman in the employ of the Western Union Company, ascended a pole at the corner of Flushing and Carlton avenues, Brooklyn, during the storm of the 21st ult., for the purpose of repairing the wires, which had broken. While occupied at the top of the pole, the latter suddenly gave way beneath the weight of wires and snapped in twain, throwing the unfortunate man to the ground with great violence. He was picked up by his associate workmen and died shortly afterward. Mr. O'Brien was 24 years of age and a good workman, and literally died in harness.

ST. LOUIS, MO.—On Christmas eve Mr. E. L. Parmelee, the W. U. all-night chief, was surprised by some of his friends, who presented to him, without any formal remarks, a silver water service consisting of four pieces, each article having his name engraved thereon. Ed's face was an index of his feelings, smiling all over, and his heart was so near his throat that his tongue could not utter the gratefulness he evidently felt. In about an hour after he thought of many an eloquent phrase he might have expressed, and which he will keep in reserve for another occasion. Everybody congratulated him.

OLD TIMER.

John H. Kratz, a Pennsylvania operator, 20 years of age, has been missing since September. Two years ago he learned telegraphy under Mr. Selser, and became a good operator. Subsequently he entered the service of the Philadelphia, Wilmington & Baltimore Railroad, and was stationed at Castleville. While there he was appointed night operator at another place, but not liking it he resigned and left the service of the company about the 20th of September. Getting an order for his pay, he went to Wilmington, Del., to draw it, but has not been heard of since that time. He left his trunk and clothes at the hotel where he boarded at Castleville, and took nothing away with him.

WISCONSIN, MINNESOTA AND DAKOTA.—Mr. J. F. Moore is now agent and operator at Balaton, Minn., on the Chicago & Dakota Railroad. Mr. A. F. Schauble, formerly agent and operator at Verdi, now fills a similar position at Lake Benton, on the same road. Mr. L. H. Hall, of the train dispatcher's office at Sleepy Eye, has taken Mr. Schauble's place at Verdi. Mr. H. G. Smith, formerly agent at Canby, is now agent and operator at Brookings, Dakota, on the D. C. R. Mr. H. L. Wadsworth succeeds Mr. D. H. Moore at Volga, Dakota, same road. Mr. O. W. Berry, formerly agent and operator at Lamberton, Minn., W. & St. P. Ry., is now with the C. & N. W. Ry., Wisconsin division, at Oakfield, Wis.

TOPEKA, KANSAS.—The Western Union force in this city is as follows: Manager, Mr. E. L. Smith; Messrs. W. B. Paddock, F. C. Lacey, and E. A. Bliss, operators. Messrs. Paddock and Lacey work "week about" on report. The W.

U. branch office in North Topeka is presided over by Miss Bessie Larsh. Mr. Geo. C. Sperry is operator at the Atchison, Topeka & Santa Fe general offices. Mr. S. J. Bear is manager of the American Union office. At the A., T. & S. F. depot Messrs. B. McMurtrie and C. Gertisen are train dispatchers, and Messrs. A. W. Parks, C. P. Foreman and C. E. Waterbury, operators. Mr. Frank Mullen is operator at machine shops of Santa Fe Railroad. At the M. P. Railway depot M. J. Nichols and L. J. Walker are operators.

ALLEGHENY VALLEY RAILROAD.—The general offices are at Pittsburgh, with Mr. J. F. Henrici as chief operator, and Mr. J. A. Smith at the superintendent's office. At the dispatchers' office are Mr. Jno. B. Stewart, an old-timer, and formerly our chief operator, but at present day dispatcher, and Mr. Wm. Truby, night dispatcher, with the Burns Bros. on hand to rush the boys with train orders. At Sharpsburg Mr. J. B. Meechs is agent and operator, while at Sandy Creek and Verona Messrs. Cyphers and Simpson fill the same position. Hulton people are accommodated by Mr. Jas. Marshall; Parnassus by J. E. Lang, while at Chartiers H. M. McGeary is agent and operator, with the post-office and express business to recreate on. Messrs. Weaver and Barras are at W. P. Junction; McCutcheon, at Kellys; Crusan and Carmody at Kittanning, and W. H. Hotham at Mahoning. This brings us to Red Bank Junction, where all business from the Low Grade Division is transferred. As agent we find here Mr. W. G. Wattson; day operator, W. F. Morris and W. S. McGeary as "owl."

MINNEAPOLIS, MINN.—Chief Rogers has made his appearance at the office but once for a week or more, and then he was as silent as Grant. 'Tis rumored the dentists are working on him, and that they expect to have his mouth "open for business" in a few days. Mr. Frank P. Brown, late of Chicago, has been taking night report here for the past two weeks, and is highly complimented on his "copy." Mr. Charles E. Schultz, who for the past three years has faithfully served in almost every capacity on either the day or night force here, has been appointed manager of the Stillwater, Minn., office. Here's our hand, "Sir," we wish you success; you certainly deserve it. The operators in this city are waking up to the fact that if they expect to keep posted on matters pertaining to their profession, they must subscribe for THE OPERATOR. Several noble Knights of the Key at "Na," as well as at the different railroad offices in the city, have accordingly planked up their little dollar for 1881 and are happy. Others declare their intention to be made happy in the same manner very soon.

## MARRIED.

WILEY—PUTNAM.—At Sparta, Ga., on Jan. 6, Edward Wiley to Miss Lucy D. Putnam, manager of the Western Union office at Sparta.

MCVEETY—DECKER.—Jan. 5, J. H. McVeety, agent and operator St. P., M. & M. Railway, Maple Plain, Minn., to Miss Sadie Decker.

MOORE—RICHARDS.—At Tolono, Ill., Jan. 19, by Rev. J. P. Mills, Mr. Roger P. Moore, manager A. U. office, to Miss Jennie Richards.

BOYER—SHUCK.—At Pottstown, Pa., Sunday, Oct. 31, 1880, by the Rev. Dr. Evans, Richard L. Boyer, of Philadelphia, to Miss Annie E. Shuck, of Pottstown, Pa.

HANDY—CULBERTSON.—At the residence of the bride's parents, Tolono, Ill., Jan. 13, by Rev. E. A. Hamelton, Mr. W. E. Handy, operator W., St. L. & P. R. R., to Miss Jennie Culbertson.

STEVENS—BORHEK.—Dec. 30, 1880, at the bride's residence, Bethlehem, Pa., Thomas J. Stevens, formerly manager W. U. office, Bethlehem, now connected with the A. U. Company, Toledo, O., to Miss Annie A. Borhek.

## DIED.

O'BRIEN.—On the 21st ult., at Brooklyn, Richard S. O'Brien, lineman in the employ of the Western Union Telegraph Co.

McKENKIE.—Jan. 19, at Hunnewell, Kansas, Mr. W. J. McKenzie, for several years operator for the K. C., F. S. & G. R. R.

CRANE.—Jan. 13, at Machias, Me., Mr. James E. Crane, formerly operator in the Portland W. U. office, aged 38 years.

## All Persons Sending for

Catalogues or ordering articles advertised in our columns will do us and our Advertisers both a great favor by mentioning that they saw the advertisement in

**"THE OPERATOR."**

### DR. BRYAN'S Electric Belts and Suspensories,

FOR THE SPEEDY AND PERMANENT CURE OF  
**Diseases of the Kidneys and Bladder, Nervous Debility, Seminal Weakness,**

Impotency and all derangements arising from SELF ABUSE or SEXUAL EXCESSES, and for which they are unequalled, for when these are used

**NO MEDICINE IS NECESSARY.**

Dr. Bryan's Electric Belt with Suspensory will cure when  
**Every other means have failed,**

And they are the only remedies that will cure. They can be worn without any inconvenience, or trouble, and without fear of discovery or exposure; the action begins as soon as they are put on, and unlike medicines they never do harm. This method, therefore, has many advantages over other modes of treatment.

THE

**American Bell Telephone Co.**

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly, or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This Company desire to arrange with persons of responsibility for establishing

**DISTRICT OR EXCHANGE SYSTEMS,**

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as agents, for the purpose of establishing

**PRIVATE LINE**

AND

**CLUB LINE**

systems, for business or social uses. Also to introduce the telephone for

**SPEAKING TUBE**

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company, No. 95 Milk street, Boston, Mass.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law,

### SPLENDID IMITATION GOLD WATCHES, FOR TRADING AND SPECULATING. ONLY \$6.

The Watch which we offer for sale is a good imitation of a Gold Hunting Cased Watch in color and appearance. The metal is a composition of other metals, so closely resembling gold that it is difficult to detect the difference except by chemical test. The works embrace the celebrated IMPROVED AMERICAN MOVEMENT and EXPANSION BALANCE. The case is Massive, Strong, and Exceedingly Handsome. The illustration is only half size and will give you only a faint idea of our justly celebrated Watch. This watch you can sell for \$15 to \$20, and take any goods you can find a market for in exchange. This will enable you to make a profit of \$10 to \$15 on the Watch, also a profit on the goods. For this reason Farmers as well as Agents can engage in this new and highly remunerative field of easy labor. We will send the watch by registered mail free of all charges on receipt of \$6 and guarantee safe delivery or we will send it C.O.D. on receipt of \$2.00 on account. Splendid IMITATION GOLD CHAINS only \$1 each. Medallion Charms 50 cents extra. This watch is extensively advertised and sold by other firms at \$10 each. Don't pay Ten Dollars when we will sell you precisely the same watch for \$6. We sell a great many and are willing to sell you a single one at a bargain, knowing you will order a number at a time when you find they are really good and salable. **World Manuf'g Co., 122 Nassau St. N. Y.**

Watch at wholesale price, in order to give you a chance to try and sell them, knowing you will order a number at a time when you find they are really good and salable. **World Manuf'g Co., 122 Nassau St. N. Y.**

Children learn arrangement of letters into words and words into sentences without a teacher. **125 TO 150 LETTERS WILL SET UP ANY NAME AND CAN BE CHANGED AT THOU SAND TIMES.** The best thing for marking Linen ever invented; Ink is indelible. can print 500 cards an hour, visiting or business and cango in any residence or store and take their order and print their cards while there. Address **WORLD MANUFACTURING CO., 122 Nassau St., New York.**

### THE STUDENT'S MANUAL OF PHONIC SHORT HAND

"The Student's Manual to Phonic Short Hand" is based wholly upon a system that has been reduced to every day practice. The signs can be written with extraordinary quickness. A boy of twelve by this method will learn in a week what it would take an adult a year to learn by the obsolete way. Every young man about to start in the world will find this art of immense service to him. To say nothing of its absolute necessity to an editor, a press or legal reporter, it is valuable to clerks, lawyers, travelers, and merchants. It is written with special reference to the requirements of those who desire to learn without the aid of a teacher. The book is illustrated with numerous Examples: so that any one can in a very short time, report Sermons, Speeches, Trials, etc. with ease, rapidity, and precision. Many Boys and Girls, from the instructions gained from this book alone, have become excellent Reporters, and are now receiving from \$1,500 to \$5,000 a year as Expert Stenographers. It is not a difficult study, and you can perfect yourself in a short time, so that you will have a life occupation, one that always commands high salaries. Price by mail, 50 Cents. Valuable Catalogue of Agents goods free. **WORLD MANUF'G CO., 122 Nassau St., New York.**

### LATEST AND BEST.

Complete introduction to the Stenographic Art, as used for Business Correspondence and Verbatim Reporting. Arranged By **E. B. BURNZ**, Principal of New York School of Phonography. Illustrated by Plates having Printed Keys. **THE SHOWMAN'S GUIDE.** This book contains most of the marvelous things in ancient and modern magic, and is the text-book for all showmen. It shows how to knock a tumbler through a table; to drive one tumbler through another; how to make protean liquid; to make a watch stop or go at the word of command; how to walk barefooted on a hot iron bar; to discover any card in the pack by its weight or smell; to turn water into wine; how to eat fire, to dip the hand into water without wetting it; how to fill a glass with two different liquids, without mixing them; how to light a candle by a glass of water; to freeze water by shaking it; to break a stone with a blow of the fist; to tear a handkerchief into pieces, and make it whole again; how to fire a loaded pistol at the hand without hurting it; to change a bowl of ink into clear water with fish swimming in it; to produce candies, nuts, etc., from a handkerchief; and many other tricks too numerous to mention. Price 15 cents. Address **WORLD MANUFACTURING CO., 122 NASSAU STREET, NEW YORK.**

**Polly Titbits** FOR MIRTHFUL MORTALS. It is not too much to say that this book contains the principal and choicest Humor in the Language. Its size is amoth, containing over 1,000 of the Rarest Jest, Exhibiting Stories, Excruciating Jokes, Rollicking Songs, Darkly Comicalities, Button-Bursting Conundrums, End-Men's Jokes, Antation Humor, Funny Caricatures, Hifalutin' Dialogues, omical Hits, Flowers of Wit, Uproarious Poems, Laughable catches, Clown's Efforts, Kurious Scenes, Kute Sayings, adicrous Drolleries, Peculiar Repartees. In fact it is a complete "Joe Miller" and "Tom Brown" in one volume. All the Great Comic Stars refer to it, because they can find in it nothing to "touch the funny bone" every time. It contains a immense collection of Irish Bulls, Dutch Comicalities, and ankee Yarns, affording fun for a lifetime. Humorously illustrated by lots of Komikal Kuts. Price 25 cents. Address, **WORLD MANUFACTURING CO., 122 NASSAU STREET, NEW YORK.**

### The Hand-Book OF GOOD MANNERS,

and customs of good society in public and private life. This is the best work on Etiquette ever published. No antiquated customs or obsolete usages are here introduced, but everything is modern, and presented in a clear, interesting and forcible manner. It is an authority on all matters relating to behavior and social intercourse of every kind. Among the subjects treated, are: Dress, Introductions, Cards, Shaking Hands, Letters and Presents, Conversation, Morning Calls, Dinners, Carving, Balls, Evening Parties, Riding and Driving, Boating, Staying with Friends, Public Meetings, Picnics, The Promenade, Love, Courtship and Marriage. With this book no one need be at a loss how to act in any emergency that may arise, or hesitate to enter into any society, without being subject to discomfort or embarrassment. Price 15 cents. Address, **WORLD MANUFACTURING CO., 122 NASSAU STREET, NEW YORK.**

## PRICE REDUCED TO ONE DOLLAR. Lightning Flashes and Electric Dashes;

A VOLUME OF  
Choice Telegraphic Literature, Humor, Fun, Wit and Wisdom.  
CONTRIBUTED TO BY  
ALL THE PRINCIPAL WRITERS IN THE RANKS OF TELEGRAPHIC LITERATURE, AS WELL AS SEVERAL WELL-KNOWN OUTSIDERS.  
COPIOUSLY ILLUSTRATED.

176 Large Octavo Pages. Cloth. Price, \$1.  
This book is a lasting example of the literary talent and native wit of American telegraphers, all the lights of the profession having banded together to give us a book well worth reading.

"Every person who has the fortune to see this volume will desire to possess it."—*N. Y. Hebrew Leader.*  
"Written in a bright and sparkling style, and the numerous illustrations lend an additional interest to the work."—*N. Y. Graphic.*  
"The interest of the reader commences with the initial chapter, and from this to the end of the volume there is nothing but a succession of pleasurable surprises."—*Harrisburg (Pa.) Independent.*  
"Thoroughly telegraphic and highly amusing, the cartoons cleverly executed, the narratives pithily and in part brilliantly worded, while the variety supplied will make it difficult for any who may have the privilege of reading the book to do so without enjoyment."—*London (Eng.) Telegraphist.*

**EAST TWENTY-FIFTH ST., N. Y.**

ESTABLISHED IN 1847.

### S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description, under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA for Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds.

**Submarine Telegraph Cables**, 50 varieties, one to ten conductors.

**Submarine Telegraph Canal Cables**—any number of conductors.

**Aerial and Underground Cables** of all styles. Hemp armor covered.

**Lead-Covered Telegraph Cables**, one to seven conductors.

**Office Cables**, one to seventy-five conductors, gutta-percha and cotton-covered.

**G. P. Insulated Wire** of all sizes.

**Fuse, Leading and Connecting Wires** for submarine and mining purposes.

**Marks' Compound Office Wires**, various sizes, for office, underground, and outdoor use.

**G. P. Office Wire**, cotton-covered.

**Flexible Elevator Cables**, any number conductors desired, of every style, and for all purposes.

**Compressed Electric Cotton and Linen Double and Triple Covered Cordage** any style or pattern.

**Burglar Alarm, Call Bell and Annunciator Wires**, double cotton wrapped and saturated with any preparation.

**Magnet Wires**, copper and German-silver, cotton, silk, and fibre covered.

**Copper Wires**, specially covered for electrical lightning purposes.

**Telephone Flexible Cords and Magnet Wires**, finest and best manufactured.

Principal Office:

No. 58 Broadway, Rooms 22, 23 and 24, New York.

This property is situated on the south bank of the Merced river, and comprises 3,000 feet, continuous, on the lode northwest of the well-known and valuable Hite Mine.

The vein is a true fissure, with a general width of from ten to twenty feet, and is undoubtedly a continuation of the Hite vein, from which property some \$5,000,000 has been taken. The main shaft of the Hite Mine is within 250 feet of the south line of the North Hite. The ore assays from a trace of gold to \$1,500 per ton, and an average of \$20 to \$30 may be depended upon.

GENERAL THOMAS T. ECKERT,  
*General Manager of the Western Union Telegraph Company.*

### Thomas Thompson Eckert.

General Thomas T. Eckert, the newly-appointed General Manager of the consolidated lines of the Western Union, American Union and Atlantic & Pacific telegraph companies, was born at St. Clairsville, Ohio, April 23, 1825. He has always been distinguished particularly for his clear insight and a general intellectual make-up which can see two sides of a question at one time, a constitutional tendency to search into the causes which produce certain effects, and his indefatigable industry. These qualities have led him to succeed—but it is paying no particular compliment to General Eckert to say he succeeded—in all the vast enterprises with which he has been connected, until he has come to be considered as a natural leader of men and a benefactor to every telegrapher. He learned telegraphing in 1848, and in the following year was appointed postmaster at Wooster, Ohio, managing the post-office in connection with the telegraph office. It was here—more than a quarter of a century ago—that the swift flowing current of his earnestness and ability first made itself felt. In 1852, young Eckert had constructed the "Union Telegraph" lines from Pittsburg to Chicago; he was superintendent of the lines west of Pittsburgh, and with Mr. J. H. Wade, afterward president of the Western Union Telegraph Company, built most of the original lines in that part of the country. In 1859 he left the business, and spent two years, until 1861, superintending the affairs of a gold mining company in North Carolina.

At the breaking out of the civil war he returned to Cincinnati, but was soon afterward called to Washington and placed in charge of the military telegraph office at the headquarters of General McClellan, accompanying that distinguished soldier as superintendent of the Military Telegraph, Department of the Potomac, with the rank of captain. It was here that Captain Eckert's versatile character showed its matured strength, and from that time onward his promotion was rapid. His steady advancement to be Major, Lieutenant-Colonel, Brigadier General and Assistant Secretary of War, under Edwin M. Stanton, marked the value set upon his brilliant services by President Lincoln and Secretary Stanton, and led to his appointment, in January, 1865, as a commissioner to meet and treat with the Peace Commissioners of the Confederate States, at City Point.

In August, 1866, General Eckert resigned the office of Assistant Secretary of War, to accept the position of General Superintendent of the Eastern Division of the Western Union Telegraph Company. This position he held for nearly nine years, introducing many reforms in the telegraphic service. He found extravagance, and abolished it by his wise administrative qualities; he found chaos in the prevailing telegraphic routine, and reduced it to a method. He built the first trustworthy land lines connecting with ocean cables, and to him is due the credit of organizing the first cable service in this country. There were, indeed, telegraphs before, but he gave us system.

In January, 1875, General Eckert severed his connection with the Western Union Telegraph Company, and accepted the Presidency of the Atlantic & Pacific Telegraph Company, which under his direction soon became largely extended, and in August, 1877, entered into a pooling arrangement with the Western Union Telegraph Company. On the first of January, 1880, he was elected President of the new American Union

Telegraph Company, which in eighteen months constructed over 50,000 miles of wire and developed into the most extensive and powerful company ever established in opposition to the Western Union.

The end of this brilliant enterprise, and the transfer of General Eckert's services to a wider field is a familiar story to all. Speaking of this latter change, the *New York Sun* said, during the past week: "It is to the energy and practical skill of General Eckert that the American Union owes the extended and excellent system of lines which has made it so formidable as a competitor that its alliance has been sought. He planned the system and supervised the work of its construction. We suppose there is no other telegrapher living who could have accomplished this task so promptly, efficiently, and economically as it has been done by Gen. Eckert." The *Tribune*, of the same date, said: "With yesterday's work General Thomas T. Eckert becomes the controlling spirit in managing the telegraph system of the country. For a dozen years he has been recognized, among those qualified to judge, as the ablest telegrapher the business has yet produced. A man of consummate executive ability, cautious, far-seeing, tremendously energetic, he is also known, in the expressive language of Wall street, as a thoroughly square man. What he promises he performs; his word is his bond, and you always know where to find him. He never sought the present consolidation; and the public may be sure that, so long as he shapes its course, its tendency will be only to perfect the work and popularize the service by making it at once cheaper and more certain."

But perhaps General Eckert's best work is yet to come. Before the recent consolidation, two new Atlantic ocean cables were ordered from Siemens Bros., London, England, to be laid during the summer of 1881. The cables are now being made, under Gen. Eckert's arrangements and are to be the nucleus of a new and vast extension of the Ocean Cable Service. It is hoped thus to carry out a long-cherished scheme of developing an efficient system of cheap telegraphy on a grand scale, both by land and sea, and of which General Eckert will be the Aladdin. The consummation of this plan will establish direct special wires between the business exchanges all over the country and put them into direct communication with each other and with the great markets of Europe. It will supply everybody who wishes the control of telegraphic facilities with those facilities, giving private business houses wires and operators of their own whenever they require them, and doing the same thing for newspapers, exchanges, railways—in short, all interests. There will be an efficient cable service stretching from New York to London and from San Francisco to Yokohama, Shanghai, Melbourne and Auckland, and operated in connection with an equally efficient Continental telegraphic service throughout the United States, which will open a new era in the commercial history of this country and of the civilized world. In this way New York must soon become the metropolis of the telegraphic world, and England will reach her Australian colonies through New York, and by our American lines, more cheaply and expeditiously than over English wires through the Red Sea and by way of India.

In this connection there was filed at Albany, on the 19th of January, the certificate of "The American Telegraph and Cable Company." The capital stock of this gigantic company will be

\$20,000,000, with power to increase the same to such amount as may be necessary to build and construct the lines of telegraph and cable contemplated by the company, and the term of the association is fixed for 50 years, from the 18th of January, 1881, to the 16th of January, 1930, and its head-quarters are to be in the City of New York.

Thus, we shall have the poetical "girdle round about the earth," buckle it in New York, and the poet's dream will be fulfilled. No telegrapher can see poetry in the wire on which he toils for his bread; but, for all that, it may not be out of place to illustrate both the prose and poetry of such a vast scheme by an extract from a speech made by the eloquent W. Hepworth Dixon, in London, some years ago: "In the Syrian desert you come on the telegraph line connecting London with Calcutta by way of the Euphrates Valley. You may find a Bedouin Sheikh standing near with a carbine in his hand, a dozen of his servants by his side, his mare and camels in a group apart, and this bit of wire—to him a Sheitan's messenger—running through the wild man's country, and a blackbird perched on one of the telegraph poles, an emblem of that Sheitan which the untamed Arab Sheikh conceives alighted on his throne! That wire, at which the bird pecks and the Arab glares, is thrilling with a thousand human emotions—a word of whispered love from separated hearts; a dying mother's blessing to her son; a desperate merchant's order to buy or sell; a Minister's command to levy war. Who knows? The same thing, in equally poetic aspect, may be seen among the Rocky Mountains, and along the arid plains near Santa Fé. Through desolate hunting grounds on which the Sioux and Osages chase their prey and scalp their enemies, the wire runs forward, wedding the wealth, energy and civilization of New York and Boston with the growing wealth, energy and civilization of Sacramento, San Francisco and Los Angeles. When you see how we girdle the earth in a few minutes—how we throw our chains over the wildest chasms, making the wild inhabitants of these waste places wonder and inquire—the first step toward their better knowledge and their ultimate civilization—can you say there is no quickening spirit in that wire, no poetry or drama in that electric spark? The wire is a poetic and dramatic instrument. It brings the very ends of the earth together, fusing the sum of human emotions into one common sentiment.

\* \* \* \* These things are done in a dozen hours, and in another dozen hours men are talking in their breathless haste and fever of great events, not only in Paris and Berlin, but in the mosques of Cairo and in the streets of Archangel; in the bazaars of Calcutta and on the quays of Rio; by the Falls of Ottawa; in the market-places of San Francisco and in the shops at Sydney. Within a day the news is told, and at the same instant of time every human heart is quivering with the shock of those great events. Just as in the theatre you speak directly face to face with five or six hundred persons, so that every one laughs or weeps under a common impulse—laughing with the same wave of merriment, crying with the same pang of emotion—so the poetical telegraph speaks to the whole world—now become a theatre—bringing joy and sorrow, exaltation and remorse, to every kind and race of men."

The "quickenings spirit" of such a dream and the hand to wave the magic wand above all is General Eckert's; and, if his plans can be consummated, it will be at no distant day.

General Eckert's stalwart regard for his friends, and none are friends who are not deserving, has endeared him to the working force; and every operator will rejoice to see such a man coming from their own ranks to teach the world "those inspiring deeds by which Man conquers men."

### The Telegraph Agreement.

THE CONTRACT FORMALLY RATIFIED BY THE STOCKHOLDERS AND THE WESTERN UNION IN FULL POSSESSION OF ITS PURCHASED LINES—CHANGES IN THE WESTERN UNION DIRECTORY. Although it was generally understood that no action would be taken in the matter of ratifying the agreement of consolidation between the Western Union, American Union, and Atlantic & Pacific telegraph companies before the 5th inst., the public was surprised on the 3d inst. by the announcement that the transfer was 'legalized' and formally made upon that day. No reason was given for this anticipation of the stockholders' meetings, which had been called for the 5th inst., but the general opinion is that it was done to forestall any possible prohibitory action by the legislature. It was a perfectly legal transaction, however, since the law permits a corporation to secure the approval of the stockholders either by a vote of three-fifths in favor, cast at a meeting called upon sufficient notice; or at any time by the consent in writing of the same number. As Messrs. Vanderbilt and Gould alone control more than three-fifths of the stock of all three companies, there has never been any difficulty in complying with the statute on an hour's notice. On the same evening, American Union and Atlantic & Pacific blanks were withdrawn from the various offices, and Western Union blanks substituted. Orders were sent out to all the offices in the country, notifying them of the change, and in many places the signs of the two smaller companies were taken down and Western Union signs put up instead.

Supplementary to this agreement the regular called meetings of the stockholders were held. On the 5th inst. the Western Union stockholders assembled. Mr. Augustus Schell presided, and the first proposition laid before the meeting was 'Shall the capital stock of the company be increased to eighty millions?' Seventy-four and three-quarters per cent. of the stock was represented, and the vote stood 307,189 shares in the affirmative and 100 in the negative. The next proposition was to ratify the action of three-fifths of the stockholders, who on the 3d inst. voted to approve the purchase of American Union and Atlantic & Pacific by Western Union. This was carried by a vote of 307,225 shares against 600 shares. Of the 600 shares voted in the negative 500 were voted by Rufus Hatch, who was present with ex-Judge Fullerton, his counsel, and in casting his vote entered what he said was a protest against the consolidation and the increase of the stock. Nobody seemed to know or care who voted the other 100 shares. Mr. Rufus Hatch then withdrew.

At 1.30 the board of directors went into session, and the contract of purchase was again ratified by their unanimous vote. The resignations of Messrs. Hamilton McK. Twombly and Chester W. Chopin from the board were received and accepted. Mr. Jay Gould was elected to fill the vacancy caused by the death of Mr. David Jones, and Mr. Russell Sage was elected to fill the place of Mr. Chopin. The resignation of General Anson Stager as vice-president of the company, but not as director, was received. General Eckert, who was chosen a director in place of Mr. Twombly, was elected vice-president in place of General Stager, and was appointed general manager of the consolidated lines. Mr. Gould replaces Mr. Twombly on the executive committee of the directors, having as his associates on the committee Dr. Green, ex-Governor Morgan, Mr. W. H. Vanderbilt, Mr. Wilson G. Hunt, Mr. Samuel F. Barger, Governor Cornell and Mr. Augustus Schell.

The stockholders of the A. & P., consisting principally of those who had attended the other meeting, met at 2 o'clock the same day, and by a unanimous vote ratified the terms of sale to the Western Union adopted Jan. 19, and the supplemental agreement of Feb. 3. One hundred and our thousand shares were voted, mainly by proxy.

On the 7th inst., the stockholders of the American Union met and unanimously ratified the consolidation. Over three-fifths of the stock was represented.

No further action is now necessary so far as the fact of consolidation is concerned. The franchises of the Atlantic & Pacific and American Union companies have not been purchased, as the law would not permit that to be done, and those companies remain nominally in existence though actually they have been wiped out. On Feb. 19, when the regular notice to the Stock Exchange will expire, the stocks of the two absorbed companies will be removed from the lists, and the new stock publicly dealt in. On that date dividends will cease on the present stock of all three companies. The market price of the new stock will be the market price at which American Union stock may be selling, that stock being exchangeable at par into the new stock.

Our latest information indicates the selection of the following officers for the consolidated companies: President, Dr. Norvin Green; first vice-president, Gen. T. T. Eckert; second vice-president, D. H. Bates; superintendent of construction and general manager, Gen. T. T. Eckert. Thus the new scheme is fairly launched upon the world, and if the high character and ability of its list of directors and managers may be taken as criteria, its success is assured.

### Efforts to Break the Combination.

The rather difficult job of fighting the "Monopoly" goes bravely on, although the efforts which were recently directed toward preventing the great combination must now be devoted to the immeasurably greater task of breaking it. Legislation has so far signally failed; as, indeed, it must when attempting the monarchical plan of interfering between rival tradesmen. In Pennsylvania and Ohio, the American Union company, which is foreign to both those States, has virtually shut up shop and gone home; and the ridiculous spectacle is presented of the local "statesmen" of those States endeavoring by legislation to compel citizens of a neighboring State to return, open up shop again and carry on a business which the said citizens have retired from. It must thus be clear to all that, instead of endeavoring to make certain men do a telegraph business against their will, these State officials had better devote their energies toward organizing a new company to compete with the surviving one for the business which the retiring company has voluntarily abandoned.

Mr. Rufus Hatch's application for a temporary injunction to restrain the purchase of the American Union and Atlantic & Pacific by the Western Union has come to grief by the decision of Judge Barrett. Attorney-General Ward, of this State, has also rendered an official opinion asserting that the consolidation is perfectly legal. To the level-minded, this has been clear from the first; that is, if we are to maintain a republican form of government.

It is a keen sarcasm on the proposed system of government supervision, to observe that the government officials and local legislators have been the only ones to lose their equilibrium, while those most deeply interested, the bankers, brokers and produce men, have calmly set to work on the only legal, fair and reasonably hopeful scheme of opposition—the organization of stable competing companies.

Chicago has the honor of first recovering from the panic, and of organizing a rival company, under the auspices of her Board of Trade, with a capital of \$1,000,000. They sent delegates to this city, where they had a hearing before the Produce Exchange on the 4th inst. The outcome was the organization, in this city, on the 7th inst., of "The Merchants' Telegraph Company." Mr. A. M. Hoyt, of Jesse Hoyt & Co., was chosen President; Charles R. Hickox, of Hughes, Hickox & Co., Vice-President; George P. Martin, of David Dows & Co., Secretary and Treasurer, and the following Board of Directors was elected: E. R. Livermore, of E. R. & R. S. Livermore; Edward Annan, of Hazelton & Annan; Franklin Edson, of F. Edson & Co.; and David Bingham, of Bingham Brothers. Articles of incorporation were prepared and sent to Albany. In the allotment of the \$1,000,000 capital, Chicago will be given \$500,000 worth of stock, New York, \$300,000; Buffalo, \$50,000; Toledo, \$50,000; Detroit,

\$50,000; Cleveland, \$25,000, and Milwaukee, \$25,000. The shares are to be of a par value of \$50 each, and no merchant can take more than \$5,000 worth. Each of the officers took a subscription list and in five minutes Mr. Bingham had secured subscriptions for \$20,000. The new line between New York and Chicago will be 1,000 miles long, and will be provided at first with four No. 8 wires. Cincinnati merchants are already prepared to tap the proposed line either at Toledo or Cleveland. Messages will be transmitted at the rate of 20 cents for 10 words, against 50 cents now charged by the Western Union, and customers will receive a rebate at the end of the year, after providing for expenses and a sinking fund, out of 40 per cent. of the gross receipts in proportion to the number of messages they send. We fail to see, though, what use this new "opposition" will be to the general public, since it is not intended to enter into any competition with any existing telegraph company, but to confine the business of the company exclusively and entirely to the transmission of Produce Exchange messages. No outside business of any kind will be accepted, nor at any time does the company propose to transact a general telegraphic business. We have not noticed the name of any experienced telegrapher in connection with it, and the report that Col. R. C. Clowery, general superintendent of the Western Union, would assume the presidency of the company is emphatically contradicted by the colonel himself. In addition to the want of experienced leaders, there are other elements of dissension in the new concern. The Produce Exchange men want the facilities extended West, while the Cotton Exchange men naturally want wires South, though both exchanges have approved the general plan.

The New York Petroleum Exchange has appointed a committee to confer with the committees of other exchanges with a view to securing telegraphic facilities independent of the monopoly. The United and Tide-water Oil Pipe Line have their own telegraph wires to the oil region, and a proposition is on foot to secure the privilege of their poles for a special wire for the use of the members of the exchange.

At Trenton, N. J., a bill has been introduced in the Senate, empowering the Pennsylvania Railroad Company to maintain telegraph lines for public and commercial uses.

The American Rapid is pushing ahead, and has just given out the contracts for 8,000 miles of line, the erection of which is to be commenced at once.

At Albany, on the 1st inst., "The Central and South American Telegraph Company," with a capital of \$5,000, filed articles of incorporation. The lines are to run from New York to Texas, and thence to South America.

The Mutual Union Telegraph Company seems, thus far, to be the most powerful opposition. It is pushing the construction of its lines in a business-like way, and President Evans hopes to extend them as far as Washington before another month.

Meanwhile the consolidated Western Union and its friends are not idle. We have before referred to the "Land and Ocean Telegraph Company." On the 1st inst., "The American Cable Construction Company" filed articles of incorporation, at Trenton, N. J. The incorporators are Denis Doren, Wager Swayne, Solon Humphreys, G. P. Morosini and A. F. Calif. The capital of the company is fixed at \$1,000,000, and the company is empowered to lay ocean cables around the world. At a meeting of the Board of Directors, held at Bayonne, N. J., the following officers were chosen: Denis Doren, President; G. P. Morosini, Treasurer; and A. F. Calif, Secretary.

By far the coolest of all the projected new companies is "The United States Postal Telegraph Company," a bill to aid which was introduced in the United States Senate, by Senator Kirkwood, of Iowa, on the 28th ultimo. The bill proposes to authorize this company to construct lines throughout the United States and in all the waters embraced in treaties made with other governments, and to enter and occupy any and all government post-offices for the establishment of stations and the performance of postal telegraph service during 100 years, with a right of renewal. Further, that the company shall be empowered to construct and maintain lines over all public and pri-

vate lands, post-roads, bridges, etc., to the same extent that the government might exercise its "right of eminent domain" for the same purposes; that a Fourth Assistant Postmaster-General shall be appointed to exercise a supervision over the affairs of the company; that the tariff to the public shall not exceed 20 cents for twenty words or less, for any distance in the United States, and where delivery is made through the Postal Department the government shall assume all responsibilities and charge 1 cent per message for drop-letter delivery, 2 cents for carrier delivery, and such rates as may be fixed by the Postmaster General for special delivery when a receipt may be demanded by the sender. The capital stock is to be limited to \$100,000,000, in two series, "A" and "B," of equal amounts, each series limited to \$45 per mile for each mile equipped with one wire, and \$50 per mile for each additional wire. Series "A" is to be dividend-bearing, and shall alone represent the ownership and management of the property. This stock is to be sold to the public. Series "B" is to be non-dividend bearing, and allowed no voice in the management, except in the disposition of property and franchises, and shall be donated to the United States in return for the privileges granted. Thus, this company desires the government as a sleeping partner, with a proviso that, after defraying the expenses, the government must sleep very sound, drawing no interest, and having "no voice in the management."

Another chimerical scheme is "The National Anti-Monopoly League," which has so far done no more than pass resolutions, some of them of a decidedly Kearneyistic turn, and many of them calculated, if they were put into effect, to compel shareholders to withdraw their savings from all telegraph companies.

It will thus be seen that the merchants are the only responsible body of men who have recognized the true exigencies of the occasion, and who have depended solely upon fair means, and disdained to join in the unmanly and un-American cry for government aid. What the American Union did in its own excellent way in eleven months can be done again, and so long as we produce the brain, brawn and capital typical of our country, no "Monopoly," great as it may seem, can have more than a temporary existence.

On Thursday, Feb. 10, President Reed, of the American Rapid Telegraph Company, appeared before a committee of the Produce Exchange and explained the system of his telegraph company, and proposed a plan to the committee by which, with the co-operation of the merchants, the company shall extend its wires to various markets, so as to meet the special wants of the commercial community. The plan suggested by Mr. Reed will be taken into consideration. If it is accepted by the Produce Exchange merchants it is possible that a traffic arrangement will be entered into by the Rapid Company with the new Merchants' line, all the stock for which has now been subscribed.

On Saturday last Judge Truax, on the application of William S. Williams, who holds 100 shares of Western Union stock, granted a temporary injunction, restraining the company from increasing its capital stock, and from ratifying any contract for the purchase of the stock and franchises of the A. & P. and American Union companies. The ground taken by Mr. Williams is that the Western Union is paying \$15,000,000 for American Union stock which is only worth \$5,000,000, and \$8,000,000 for Atlantic & Pacific stock which is only worth \$3,000,000, which causes a depreciation in Western Union stock. The order is returnable on the 17th inst.

#### An Electrical Society Organized.

The preliminary meeting called for the purpose of discussing the feasibility of establishing an electrical society in New York took place, as announced in last issue of THE OPERATOR, at the United States Hotel, on Tuesday evening, Feb. 8. Although the evening was not a pleasant one for walking, the attendance was very much larger than the most enthusiastic friend of the movement had anticipated.

The meeting was called to order at 8.25, by Mr. E. A. Leslie.

Mr. D. R. Downer was nominated for chairman, but said that as Mr. Leslie was in a great measure instrumental, in conjunction with Mr. F. W. Cushing, in bringing about this movement of forming an electrical society, he should have the honor of being chairman of the meeting. Mr. Leslie, however, declined the position, and Mr. F. W. Jones, general circuit manager of the Western Union Telegraph Company, was chosen to preside, with Mr. J. W. Moreland as secretary.

Mr. Jones, in taking the chair, said that he was heartily in favor of the establishment of an electrical society in New York, and that, as the present meeting was called for the purpose of talking the matter over, he would give a brief history of the American Electrical Society of Chicago, and of some of the difficulties it had to contend against in its earliest days. Mr. Jones concluded by saying that the intention to-night was not to spring any particular plan; he had not heard a plan proposed by anybody; it was merely a meeting to think the matter over and give expression to individual views, so that a plan of organization might thus be arrived at. For his part he was in favor of not confining the society merely to the telegraphic branch of electrical science, but to admit into it those in any way connected with or interested in the general subject of electricity.

Mr. Downer said that there was no doubt but that a society of this kind was much needed. Scarcely a day passed that did not bring some one to him asking for information on electrical matters, or on the mechanical construction of telegraph instruments, especially of the more recent forms. If he referred them to books, they had not the time to read them. He thought, therefore, that an electrical society would prove an inestimable boon to the telegraphers in this city, and that in connection with the society there ought to be a reading room and library, containing not only the American and foreign electrical journals, but also the leading magazines, scientific and popular, as well as the daily papers and electrical and other suitable books. He said that he had several books which he had been saving to donate to a society of this kind. Mr. Downer spoke of the efforts made by the late Mr. John Horne and others to establish such a society; he hoped the present movement would prove successful. The promoters, he thought, had everything in the world to encourage and nothing to discourage them.

Mr. W. G. Magowan thought that the members of the society should be largely composed of working operators, and for the benefit of this class and of others whose electrical knowledge was very limited, should begin low and gradually work up to the more complicated departments of electrical science.

Mr. Leslie concurred in this view.

Mr. George B. Scott thought that a library was indispensable—a place where the members and telegraphers generally could spend their leisure time, and study and consult scientific books and periodicals, especially the current newspapers and magazines devoted to electricity, as the latest developments of electricity, he very properly added, are not found in books, but in the journals devoted to the subject. Mr. Scott believed that by attendance on the lectures, and an interchange of views, most of the members would find that they knew more about the subject of electricity than they at first supposed.

Mr. E. C. Cockey, while heartily in favor of the society, did not think that it should be turned into a school. He thought the society would prove beneficial and instructive without going through a regular course of study. After the lecture of the evening the audience should criticize or ask for information on obscure points. In this way the meetings would prove interesting and beneficial by an interchange of views.

Mr. J. N. Ashley being called upon for his views said he was gratified to see so many present. His idea was, first organize an electrical society, and provide a place and time for meeting; then make a start, and the other things, such as a library, reading room, etc., would naturally follow. After speaking of the success of the American Electrical Society, and of the interest he had taken in the reports of the meetings, he said he hoped that a society would be started that night, which would be equally

as successful and its meetings equally as interesting, and promised to do all in his power toward that end in the columns of the *Journal of the Telegraph*. He was sure Mr. Johnston would do the same thing so far as THE OPERATOR was concerned.

The chairman said that he was just about to call upon Mr. Johnston, who had done so much for the fraternity already, and would, he was sure, do anything he could to further such a society as this.

Mr. Johnston said that Mr. H. W. Pope had suggested to him, some months ago, the idea of establishing a telegraph and telephone club in New York. He did not see why the foundation might not be laid for a club of this character, and also for a reading room and library, in connection with the proposed society. He thought the society should open its doors to doctors, amateur electricians and any others interested in the subject who might wish to become members, and that a subscription list for the purpose of securing money enough to put the society, as far as possible, on its feet financially from the outset, would be generously responded to. He was glad to notice the increased demand for electrical knowledge, as evidenced by the large number of letters he is constantly in receipt of, asking what books he would recommend to those wishing to study electricity. He was also pleased to say that the series of scientific articles by Mr. T. D. Lockwood, now running in THE OPERATOR, had met with much success.

Mr. Cushing, being called upon, said that it seemed to him that the sense of the meeting was unanimously in favor of the establishment of an electrical society and, in conjunction with Mr. Ashley, he offered the following resolution:

*Resolved*, That we form an electrical society, and that a committee of seven, of which the chairman of this meeting shall be chairman, be appointed to prepare a constitution and by-laws for the society.

Messrs. F. W. Jones, Geo. E. Baker, Geo. B. Scott, E. A. Leslie, J. W. Moreland, E. C. Cockey, and F. W. Cushing were appointed as such committee.

The secretary read during the evening the following anonymous letter:

"Upon the condition that this society will induce the several local societies of similar character to combine, making one *grand national society*, to meet in New York, a gentleman will give free use of a library, some electrical and telegraph books and papers and a room in the center of the city free for some time for the meetings, and furnish free electrical and telegraph journals."

As this letter was neither dated nor signed the meeting could not, of course, take any action upon it. Mr. Jones, however, referring to the proposition it contained, said that he did not think it at all probable that such a consolidation suggested was possible. The American Electrical Society of Chicago, established several years ago, and numbering among its members many prominent electricians and scientists, would hardly, he thought, care to become subordinate to the New York society. The various local societies, too, would not be likely to consider a consolidation desirable. If, however, the offer were made in good faith, he did not see any reason why the writer, were the matter properly explained to him, should not make the offer to the proposed society itself as it stood, irrespective of any question of consolidation.

The following names were placed on the membership list, and the meeting adjourned to meet at the same place on Wednesday evening, February 23:

F. W. Jones,  
J. K. Knight,  
Theo. Torrey,  
E. C. Cockey,  
F. W. Cushing,  
Chas. E. Davis,  
Geo. B. Scott,  
D. R. Downer,  
J. N. Ashley,  
D. Le Rougetel,  
Joseph L. Edwards,  
A. T. Creelman,  
Geo. E. Baker,  
Edward H. Murphy,  
E. T. Barberie,  
J. W. McLaren,  
J. M. Moffatt,

Jas. W. Phinney,  
Thos. R. Taltavall,  
Minor M. Davis,  
H. L. Storke,  
Richard Smith,  
Geo. F. Stainton,  
W. B. Waycott,  
J. R. Calder,  
W. J. Johnston,  
H. W. Gilbert,  
Wm. G. Magowan,  
M. H. Collins,  
C. A. Stimpson,  
F. Catlin,  
A. S. Downer,  
W. J. Dealy,  
J. W. Moreland,

### The Man I Met on the Train.

I met a man on the train a short time ago. By the way, as Dundreary would remark, "A f-fe-fellow frequently meets other f-fe-fellows on the train, you know."

Well, there was something striking in the appearance of this young man. His hat was set jauntily over his left ear, and the cigar in his mouth was pointing over his right shoulder, in that particular position which necessitates a peculiar knowing squint of the right eye. He stood out on the platform, with his hands in his pockets, apparently regardless of the fact that the train was moving at the reckless speed of 12 miles an hour! There was such an expression of supreme wisdom upon his countenance, and his aspect was so generally intelligent, that I at once concluded he was a telegraph operator. Acting upon this hypothesis I approached him, influenced by the same motive which induces me when in a library to pick up a massive encyclopedia, viz., to procure information, being of an inquisitive temperament. The Impersonation of Knowledge proved to be quite approachable. He was affable, loquacious and condescending, and before long became confidential. He asked my name, and, upon being told that my inherited patronymic was Smith, immediately inquired if I were a relative of Constantius Smith, whom he remembered to have met at a select social reception given to him by the "Segregated Order of Unmitigated Plugs," in the city of Boston, when Billy Kettles, Eitemiller, Hank Cowan, Lin C. Doyle and one or two other noted telegraphers were present. Having, with my customary frankness, assured him that Constantius was a near relative and valued friend of mine, he became more loquacious and confidentially communicative than before.

A telegraph operator? Why, of course. At least, that was one of his numerous professions, although at present he was just a little out of practice, not having worked at the mystic art since he resigned his position in the "Central office" at Paudunk Flats, to accompany Andy Johnson on his swing around the circle several years ago, being a particular friend of the Tennessee tailor, who had promised him a Cabinet position in the event of his (Andrew's) re-election. Andrew got left, however, and our friend was also left—to his own resources. He shipped for a three-years' cruise before the mast; was shipwrecked in the Suez Canal; washed ashore by a bar of soap, which he happened to have in his pocket, was captured by Chinese pirates, married the daughter of the "Hi-Yu-muck-a-muck" of the Buccaneers, became King of the Hoop-la cannibals; deserted his adopted tribe; claimed the protection of the American Consul, who gave him a half-fare railroad ticket to America, where he arrived in safety a short time ago, and is now a candidate for the legislature from Whoopemup County, Arizona! Naturally enough, I was completely overawed when I heard from his own lips that I was in the presence of a genuine nineteenth century hero of the dime-novel school; and, being perfectly satisfied that the untold portion of his history could not be more interesting than the brief chapter outlined above, I modestly returned to the original subject by remarking that I myself had acquired a somewhat brilliant reputation as an operator, hoping thus to be able to draw him out and induce him to expatiate upon a subject which I was capable of comprehending and conversing upon intelligently. The effort was a failure,

however. He made one or two feeble remarks, and then went wandering off toward the Suez Canal, Chinese pirates, Mexican banditti, etc., mixing things up regardless of geographical lines, and really shaking my confidence in the veracity of his narrations by the reckless profusion of his "hair-breadth 'scapes" crowded into a short portion of time.

At last, however, I succeeded in getting him located at 145 Broadway in 1864. Then I incidentally remarked that I also officiated in that particular office at that identical time, whereupon, with the most nonchalant air imaginable, this telegraphic veteran inquired: "Did you—ah—did you send or receive?" I promptly informed him that I received messages with a crow-bar, dispatched them with a hatchet, and delivered them by special police.

Just then the conductor came along for the tickets, and as the train had providentially or otherwise slackened its speed, my acquaintance with 'ye I-know-it-all countenance and interesting history, embraced the opportunity of "silently stealing away," obviously for the purpose of eluding the uniformed minion of a grasping monopoly, who wanted to oppress the passengers by collecting fares; and, as he disappeared, there ran through my mind a nonsensical jingle by Shakespeare, "Pinafore" Gilbert or somebody else, the words of which are about as follows:

"You can't sometimes most always tell  
An electrical 'bilk' from a genuine swell,  
And I've seldom seen—or scarcely ever—  
A fellow as smart as he thought himself  
clever." PACIFICUS.

### Money by Telephone.

"Say, Miss," said a rather hard-looking customer to the young lady in charge of the Central telephone office, one day last week. "Say, Miss, I'd like to talk with Mr. Joseph Snooks a moment."

The lady called Snooks and turned the instrument over to the guest.

"Halloo, halloo! Mr. Snooks!"

Snooks answered, and in the ensuing colloquy the lady could, of course, only hear the hard-looking customer.

"Snooks, old boy, I can't come up for that money to-day; I'm too busy."

"Eh?"

"No, can't get away."

"I know, but I'm sorry; I've got to meet Brace about your affair."

"But I'd jeopardize all our interests. I positively can't come. Can you send the money down?"

"Down here."

"I don't believe she'll do it, will she?"

"No, I don't know her. She's a handsome girl, with blue eyes and light hair. Know her?"

"I'll ask her about it. Wait, keep your ear there [Miss, Mr. Snooks wants to pay me four dollars, and says for you to let me have the money. I'll ask again to make sure]. Snooks, did you mean for this fine young lady to pay me and charge it to you?"

"Don't hear you."

"Yes, yes, all right. [He says, Miss, for you to take my receipt and let me have the cash. You are to put it in his telephone bill]. All right, Snooks, good-by, see you to-morrow," and he hung the mouth-piece on the hook.

"Fine fellow, Snooks," he continued, looking pleasantly at the manageress. "I never heard of sending money by telephone before, did you?"

"No," responded the lady.

"Perhaps you haven't the change handy?"

"Yes," said she.

"You'll trust Snooks, I presume," he went on in a faltering manner.

"Certainly," she replied, "if he says to let you have it."

"You don't think the telephone would lie, do you?"

"Assuredly not. I'll just ask Mr. Snooks."

"No, no. He's a sensitive man; he wouldn't like to have so much fuss over a small amount. Make it two dollars and I will give him a receipt on account."

"I'll pay anything Mr. Snook says. I'll call him."

"Rather than trouble him again, I'll make it a dollar. Give me a dollar—"

"But I prefer to call him."

"Miss," said the man, "don't go near the wire now. There's a cloud coming up. You're going to be struck by lightning. Rather than that I'd take fifty cents—a quarter."

"Oh! I'm not afraid," and she approached the instrument.

"Keep away from that wire!" he howled; "don't call Snooks; he might be struck. If you don't care for yourself, have some mercy on his family. You needn't pay the amount at all. I wouldn't risk Snooks for all the money in town."

"I shall either call Snooks or a policeman," said the girl firmly.

"Make it a policeman and I'll go for him myself," shouted the tramp, as he jumped over the rail.

And then she called Snooks, who had been swearing at his end of the wire in the hope of making some one hear him, and told him it was all right, she hadn't quite paid the money.

### Still in the Law Courts.

Readers of THE OPERATOR have already been informed that, prior to the consolidation, the Pennsylvania Railroad Company directed the Western Union Telegraph Company to withdraw its agents and operators from all the officers on the lines controlled by the Pennsylvania system, and that the telegraph business would be turned over to the American Union Company, at the same time threatening to throw down the Western Union wires unless they were removed by a certain date. The latter company then appealed to the United States Court at Philadelphia for a temporary injunction to restrain the railroad company from carrying out its threat. The case was argued before Judges McKennan and Butler, and is still held under advisement. Meanwhile, the Pennsylvania Railroad, as a supplement to this suit, filed an application for a counterinjunction to restrain the Western Union Telegraph Company from using the rights and privileges granted by the Pennsylvania Railroad to the American Union Telegraph Company, and on the 8th inst. the Court made the following order:

"It is ordered that the Western Union Telegraph Company be restrained from using the telegraph poles and wires of the American Union Telegraph Company in such a manner as to violate the right of the Pennsylvania Railroad Company, under the agreement of Jan. 17, 1880, with the American Union Telegraph Company."

Last Wednesday, the 9th inst., a conference was held in Philadelphia between the officers of the Pennsylvania Railroad and their counsel and Jay Gould, Gen. Eckert and Mr. D. H. Bates, representing the consolidated companies. It was then decided to suspend all operations in the matter of litigation for the present. This action is intended to hold the present proceedings in abeyance until new terms can be agreed upon.

The Faraday lecture for 1881 will be delivered by Professor Helmholtz in the theatre of the Royal Institution, April 5. The subject will be "The Modern Development of Faraday's Conception of Electricity."

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, FEBRUARY 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

## NOTICE.

MR. J. R. CALDER, a representative of this paper, expects to leave New York on Monday, Feb. 21, for a trip to Philadelphia, Pittsburgh, Baltimore, Washington and intermediate points, on the business of *THE OPERATOR*, both subscription and advertisement. Any courtesies shown or favors extended to Mr. Calder will be appreciated by the Publisher precisely as if rendered direct.

## GENERAL THOMAS T. ECKERT.

We present to the profession to-day an engraving of the newly appointed General Manager of the Western Union Telegraph Company. We present the picture also to General Eckert as a valentine; the time being appropriate and the surprise complete, for none probably will be more astonished to see it than the General himself.

Nothing that we could say can add to the prestige of the illustrious subject of our sketch. Our feeble commendation may even be a matter of no concern to him; but, in accordance with our rule, when a working operator rises from the ranks to eminence we must, as an incentive to other workers, call attention to his successful career.

At the same time we heartily commend the wisdom of the choice of General Eckert to reorganize and perfect the telegraphic system of the country. He has always been a staunch advocate of reasonably cheap telegraphy; for many years it has been his aim to give to the people a perfect telegraphic service at low rates, and now that the duty of shaping the course of telegraphic events has devolved upon him, we are confident that the excellent ideas which he has so long fostered and advocated will speedily be realized. General Eckert, with his vast experience at home and abroad—as an operator at the key, as superintendent, as chief of construction, as Assistant Secretary of War, and as the guiding spirit of vast corporations—has fairly won the esteem and confidence of those around him, and his appointment is a guaranty to all deserving men of fair treatment and recognition.

Since the Congress of the United States presented its gold medal to the great originator of Atlantic cable telegraphy, and “Honor to Cyrus W. Field” blazed forth in gas-jets in front of our City Hall, no American telegrapher—with the single exception of Professor Morse—has received more distinguished honor than General Eckert; none has better deserved it. Nearly a score of years ago, President Lincoln appropriately styled him the Prince of Telegraphers, and to-day he

stands forth as the foremost practical telegrapher in the world.

As an executive officer, General Eckert is generous and kind to deserving ones, but at the same time he is always a stern and strict disciplinarian. His presence is sufficient to dispel the spirit of fear and distrust which is too frequently found among employes; for General Eckert not only rules, but understands and appreciates the principles that underlie his ruling, and recognizes always how thoroughly the well-being of each worker is involved in the welfare of the whole. In this way that spirit of enterprise which has swept his former undertakings rapidly to success is awakened and sustained in others; since, under the spur of an excellent example, and fired with the common enthusiasm, the humblest worker in the ranks claims kinship with his great chief. The inevitable result is, untiring perseverance in all quarters, loyalty of the workers each to the other, unmelting unanimity in striving for the common good, and Contentment and Success.

Thus, as years roll on—many of them, we hope—and the world goes whirling down the ringing grooves of change, General Eckert may look with satisfaction upon the prosperity among his subordinates which his administration has given them; while the civilization and the stronger bond of amity between nations which his work is now spreading, and to which he has brought such a wealth of thought, experience and energy, will be his monument.

ALTHOUGH we have tried to bring operators to see how short-sighted a policy it is for them to turn their offices into telegraph colleges, this journal has never objected to a freeman making an honest living in any way that may suit him, and the doctrine covers even the professors who are teaching our mystic art for a stated sum. They have as clear a right to make a living by teaching telegraphy as any other monitor has by teaching free-hand drawing, or architecture, or the mysteries of Coke and Blackstone. The country is free, and if there is any man particularly fond of freedom it is your old-time, genuine operator, free as a bird. But we object to deception and sophistry, and when we detect alleged telegraphers in attempts to beguile the uninitiated, we feel bound to oppose them. There, for instance, is N. J. Saviers—or, rather, what is left of him—to whom we accord a free advertisement in this issue. We object to his circular as a double infliction of falsehood and bad grammar upon the suffering public. Read it carefully. “Owing” is a good word for one of these peripatetic professors to commence a screed with, although it is in the natural order of things. The “scarcety” of operators is as nothing beside what the “scarcety” of such shocking orthography is in our profession. “It is proposed to place it in the reach of every one who wishes to avail themselves” is such a master-piece of composition that we do not wonder that “hence terms are made unapproachable,” except for millionaires. All through the circular is found the same enchanting disregard of grammatical conventionalities, and philanthropic invitations to spend your money flow from the writer’s pen like charming music from the throat of the nightingale. But it is in the matter of board where he comes out strong; although “three dollars per week” is enough to make the hair in the butter stand on end. As we said before, we have no objection to any man making a trade of teaching telegraphy, including the abstruse art of taking a “salting” with a

good grace; the proper way to “frite gerse,” the inner mysteries of dots and dashes, and breaks, and reds, and blacks, and quads, and duplexes, 27, 18, 134 and all the business, in the short period of two months—if he could do so; we desire to interfere with no man’s educational labors, but what we do object to is this: We object, among other things, to the following statements, which are as false as the ingenuity and shamelessness of a swindler could make them: “Two months will qualify anyone with ordinary intelligence to take a position.” “We can guarantee a situation in every instance.” “We want fifty operators on May 1 for one company.”

Saviors? Saviers! Can this be the well but not favorably known N. J. Saviers against whom the Western Union Company has a suit at law? For his silent partner in the business, who uses the Atlantic and Pacific Company’s wires in connection with the “College,” we have an appropriate motto, which we hope he will paste in his hat: “A rolling Stone gathers no Morse.”

ON the 11th of June, 1873, John George Boyce was admitted to the Telegraphers’ Mutual Benefit Association. He allowed his membership to lapse, through poverty, December, 1873; was fully reinstated October, 1876, and died at Lake City, Florida, Nov. 15, 1877. It was reported to our executive committee that he died of consumption, although the attendant physician swears he died of some other disease, having been confined to his bed only five days. His claim was rejected by a majority of one, out of nine votes. The obligation put by our exacting rules upon those faithful and tried officers left them, in the light of the grossly perverted testimony placed before them, no alternative but to reject the claim, as the mitigating circumstances could not weigh with them, considering their prime duty to us. The reluctance with which they were forced to this decision is best illustrated by the prompt and generous manner in which, after voting down the claim on our Association, they recognized the equity in the case, and gave double, thrice and even ten times the amount called for by a regular assessment.

In this connection, Mr. Watson, the able Secretary of the Association, wrote: “It is certainly by far the hardest and most pitiful case we have ever known, and as far as my personal feelings go I should much have preferred to recommend payment.” Mr. J. M. Crowley, of Augusta (the district where Boyce died), wrote: “I am sorry to hear that this claim has not been settled. It is my opinion that the Association is bound for it, and hope it will yet settle it.” Mr. Heber C. Robinson, the agent who readmitted Mr. Boyce, solemnly avers that the candidate was in as good health at the time of his reinstatement as when, through his inability to pay, he allowed his first policy to lapse.

THE OPERATOR believes that, in case of a grave doubt, our executive committee, about whose integrity there can be no question, should have discretionary power to accord the benefit of that doubt to the deceased. We believe that when once a certificate of membership has been issued to an operator, and he has paid his assessments regularly for one year, his claim should be indisputable, unless vitiated by his own conduct subsequently to his admission. Moreover, we believe that the payment of this claim is a debt of honor which the members of the T. M. B. A. can not with justice ignore; and, therefore, we hope that it will be speedily paid.

If remittances are made to this office, we will promptly turn over the amount to Mr. James N.

Ashley, Secretary, and acknowledge receipt in these columns.

IN the light of several recent fast-sending tests, and much discussion upon the subject, it may be well to cull from the records a few well authenticated instances of rapid telegraphy, and which we believe to be the fastest on record: About New Year's, 1868, "Circular No. 4," issued by the Western Union Company, instructed certain local officials to try the speed of the ordinary Morse instrument, and several trials were made, East and West, under this order. On the 21st of January, 1868, Messrs. D. F. Marks and Charles Bagley, of the New York Western Union office, sent to Nicholas J. Snyder, at Philadelphia, 2,514 words of press in one hour. On the 20th of February, 1868, Mr. Edward Stewart, of Washington, D. C., sent to Mr. Nicholas J. Snyder, at Philadelphia, 2,540 words of press in one hour. This was the first half of a speech delivered by M. Thiers, in the French Assembly, and was sent from the columns of the *Tribune*. This record is sworn to by Mr. James Merrihew, at that time Western Union Manager at Philadelphia. On the 8th of February, 1863, Mr. E. M. Sharpe, of Cleveland, Ohio, sent to Mr. E. Curry, of St. Paul, Minn., over one continuous circuit, a distance of 450 miles, 2,631 words in one hour. This was also sworn to, and was the fastest of the official tests. On the 8th of May, 1868, between 9 and 10 o'clock P. M., Mr. P. H. Burns, of Boston, sent to Mr. Walter P. Phillips, at Providence, R. I., 2,731 words in one hour. This was a selection from the sixth chapter of Dean Swift's "Gulliver's Travels." Messrs. Snyder and Phillips received personal recognition from Professor Morse. For a half-hour test, Mr. R. I. Hutchinson, at New York, on the 19th of February, 1863, sent to Mr. Nicholas S. Snyder, of Philadelphia, 1,352 words of press (cut at random from a paper of that date) in thirty minutes. This was at the rate of 2,704 words an hour, and was also an official test. In off-hand working, 220 messages, averaging 10 words each, were exchanged over the Parker, Pennsylvania, duplex, between Parker and Oil City, in one hour, December, 1879. Fast work of a later date scarcely needs to be repeated; and, in any case, the official tests, accompanied by the sworn statements of the respective managers, can be the only reliable standards. It may be well to state that in these tests the sending must be received and copied in a legible hand by a receiving operator.

MESSRS. J. H. BUNNELL & Co. believe that the best way to demonstrate the value of their steel lever keys is to publish the opinions of them expressed by those who have used them. In today's issue will be found a full page advertisement devoted to this subject, giving strong indorsements of the keys, not only by some of the best known operators in the country, but also by several superintendents, managers and others who have practically tested the new key, and all of whom unite in recommending it to others. The firm of J. H. Bunnell & Co. stands in somewhat the same relation to telegraph manufacturers that the American Union did to telegraph companies. Although only in business for a comparatively brief period its progress has been remarkable, but no more so than the high quality and reasonable prices of the goods manufactured by the firm entitle it to.

TO-DAY is the anniversary of the birth of that sprightly telegraphic paper, *The Magnet*. Its untimely ending would, if space permitted to-day,

lead us to inquire what becomes of all the shipwrecked telegraphic journals: and, since talent has never been scarce, why the thousands of dollars invested—foolishly, it would seem—cannot keep them afloat for even as long a period as one year. But, perhaps, it is as well not to inquire too closely, and to leave the everlasting mystery for future venturesome scribblers to discover by experience, which is, after all, the best teacher. *The Magnet*, with such names as Christie, Phillips, Lucy Dana, U. S. Consul Catlin and ex-Governor Bullock to sustain it, was a journal of infinite jest. "Alas, poor Yorick," etc.

SOME of the merchants, brokers and capitalists generally who are displaying so much childish confidence in the great number of projected new companies, on condition that in the course of time they shall not consolidate with the older companies, would do well to demand real estate security for the fulfillment of those promises. Some such condition has been exacted from the Mutual Union Company in Philadelphia, where, as one of the conditions of obtaining the privilege of erecting poles and stringing wires through that city, they have been compelled to file a bond for \$20,000, which is to be forfeited in the event of a possible consolidation.

WE have frequently wondered why the pathway of the student in the wide field of electrical science cannot be kept clearer of the stumbling blocks of arbitrary signs and monstrosities of expression. Algebra is, of course, a necessity, but there can be nothing gained by loading down the student with E. M. F.'s and such pedantry. Mr. Lockwood appears to have appreciated this drawback to study, and, in confining his technicalities to reasonable bounds, he is insuring for his work a wider circle of readers than is usually found by writers on electrical subjects.

THE frequent announcements of new combinations and startling changes come before us like milestones in our professional path, recording our onward flight, marking the end of one stage and the opening of another. The consummation of the consolidation scheme reminds us that another milestone has been passed; new scenes and fresher and wider fields are spreading themselves before our eyes, and there is nothing for it but to settle down once more to the steady trot necessary to keep pace with the rapid march of events.

THE great want in telephonic apparatus of an individual call-bell, by which the party desired is called and no one else disturbed, is supplied by the inventive genius of Mr. George H. Bliss. The arrangement is quickly attached to or removed from a wire without change in the present line arrangements, and is being supplied by the Telephonic Signal Corporation. Mr. George H. Bliss, of Pittsfield, Mass., is president of the corporation, and Mr. Fred. S. Potter, of New Bedford, Mass., secretary.

THAT is a patriotic, even if a phantom, telegraph company—the United States Postal Telegraph Company—which, hailing from Iowa, coolly proposes to build and operate a system of telegraphs, providing the government gives it office room, rent free, in all the post-offices; the right of way everywhere, over public and private lands, and supplies all the money for construction. Well, as these Iowa men would doubtless phrase it, "we should gently relax the rigidity of our countenance."

WHILE they are nailing up the coffin of that wonderful organization, the American Union, the recollection of its superb administration, and its rapid development in eleven months, raises the usual post-mortem thought of "what might have been." The friends of the deceased company must, however, find some satisfaction in beholding Col. John Lenhart smiling through his tears; and, in laying down his votive offering, swelling the sorrowing and reverent enthanasia.

THE unreasonable craze for jumping out of the frying-pan into the fire, by giving dictatorial powers to the government in matters telegraphic, seems to have come to an end, and the Postal Telegraph scheme has been once more put away to rest. Such an ending of a mad stampede must be hailed with satisfaction by all true friends of a free and independent people. Let the people right their own wrongs.

THE resignation of Gen. Anson Stager from the vice-presidency of the Western Union Company, after a service of thirty years, is a matter of regret to all. Gen. Stager's steady advancement, step by step, until he reached the second highest position in the service, bears testimony to his energy and ability. He will still remain with the company as a director.

MR. H. C. TOWNSEND, late principal examiner in the U. S. Patent Office, in charge of the class of "Electricity," has taken an office as counsellor in patent cases at 237 Broadway, this city. Mr. Townsend was for eight years connected with the electrical division of the Patent Office, nearly four of which he served as principal examiner.

THE letter of our esteemed Chicago correspondent touches, with characteristic skill, on a subject which closely concerns us all—the relations between managers and subordinates. His timely argument speaks for itself, and merits the attention of those who have at heart the advancement of the profession at large.

THE unusual demand for copies of last issue exhausted our supply before all of our new subscribers had been supplied with copies. We would thank those having copies of Feb. 1 on hand which they do not want to mail them to us.

AWAY from the clamor and excitement of consolidations and legal squabbles, Mr. Cyrus W. Field is to-day enjoying his well-earned holiday in India. He is to spend Washington's Birthday in Calcutta.

AGAIN the pressure of current news has crowded out much valuable and interesting matter, for which we owe an explanation to our esteemed correspondents.

OWING to the continued crowded state of our columns, and a commendable desire to "clean up" some of the matter on hand, we to-day present our readers with a twenty-four-page paper.

WESTERN UNION stock is quoted at 111½, American Union at 79½ and A. & P. at 46½. Last issue they were 118, 84½ and 47 respectively.

WE are under obligations for an invitation to the Chicago telegraphers' ball, Feb. 24, and only regret our inability to be present.

# Notes and Queries on Electricity and Electro-Magnetism and their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

BY T. D. LOCKWOOD.

Q. 88. Describe the simplest and best methods of measuring the internal resistance of a battery.

A. There are various methods of determining the internal resistance of a battery. We give three ways which are as simple as any. The first, often called Mance's method, from its discoverer, is to place the battery to be measured in the fourth branch of a Wheatstone bridge. Let the first two branches be fixed resistances, and the third a rheostat or adjustable resistance. The galvanometer is kept in the usual place on the cross wire, but in the usual place of the battery we substitute a key, which permits us to connect or disconnect the wires, thereby enabling us to close or open the circuit at the point where the battery is generally placed. The adjustable resistance is then varied until the making and breaking of contact by the key does not alter the deflection of the needle. Then, as the resistance in branch 1 of the bridge is to branch 2, so is the resistance unplugged from the rheostat in branch 3 to the internal resistance of the battery in branch 4. Or, if the two branches at the first end are made equal, the resistance of the battery is also equal to that of the rheostat.

To illustrate: We will call the four branches of the bridge A, B, C and D, and have a resistance of 10 ohms in each of the branches A and B. We place the battery to be measured in D, and the rheostat in C. We then close the key and the needle deflects; but, on raising the key the deflection alters materially. We unplug, say, 50 ohms from the rheostat, and find then that the deflection remains the same, whether we depress or raise the key. Then, as A and B are equal, both being 10 ohms, D must also be equal to C; that is, 50 ohms. This method is practically independent of the galvanometer resistance, and is extremely accurate, because it is not affected by variations in the strength of the battery.

In the second method, here given, the tangent or sine galvanometer may be used. Connect a rheostat, a tangent galvanometer and the battery to be measured in circuit together. Vary the resistance in the rheostat till the needle shows a deflection, for example, of 45 degrees. Then, referring to the table of tangents, we find that the tangent of 45 degrees is 1. Note the resistance unplugged and find what half of the tangent of the deflection is. In this case, as the tangent is 1, its half will be, of course, one-half, or in decimals .5. Referring again to the table, we see that the degree of which .5 is the tangent is 27. Then unplug resistance until the deflection is reduced to 27. Again note the resistance unplugged. Then, to ascertain the battery resistance, double the smaller resistance noted and add to the result the resistance of the galvanometer, and subtract the total from the larger resistance. The difference is the resistance of the battery. For example: We use a galvanometer of 100 ohms resistance, and unplug for the first deflection 80 ohms. To halve the tangent of the first deflection, we have to unplug 400 ohms. We then double the smaller resistance, the result being 160 ohms, to which we add the resistance of the galvanometer, 100 ohms, making in all 260. Then we subtract 260 from the larger resistance unplugged, 400 ohms, and find that the difference is 140, which is the resistance of the battery.

The third method is also simple, and may also be worked out with a sine or tangent galvanometer. Place the battery in circuit with a sine or tangent galvanometer and a rheostat, and note the deflection. Insert resistance till the sine, or tangent, of the deflection becomes half of that of the original deflection. The total resistance is now doubled. Then deduct the resistance of the galvanometer wire and connections from the resistance added, and the remainder will be the resistance of the battery.

Q. 89. How shall we ascertain the resistance of a galvanometer?

A. If we have more than one galvanometer at hand, the obvious way of ascertaining

the resistance of either is, of course, to regard them as any other ordinary resistance to be measured, using one of them as an instrument with which to measure the other. But circumstances sometimes occur which render it desirable that we should know the resistance of the galvanometer which we are using when we have no other to use as a measuring instrument. There are several ways whereby this may be accomplished. The two simplest are here given: First, using the Wheatstone bridge. The galvanometer is placed in one of the branches of the bridge—branch 4, for instance—instead of being left in the cross wire as usual; and in the regular place of the galvanometer a circuit-closing key is placed, so that we may connect or disconnect the two points which would ordinarily be connected to the galvanometer. The battery is retained in its regular position; and, of course, the current flowing from it passes through the branches of the bridge, and causes the galvanometer needle to deflect. The coils in the other branches are then adjusted until the deflection remains unaltered, whether the key in the cross wire is depressed or not. When this is the case, a balance has evidently been effected, and consequently, we get the resistance of the galvanometer by the usual proportion; thus, as branch 1 is to branch 2, so is the resistance of branch 3 to the resistance of the galvanometer in branch 4. To illustrate: If we have 100 ohms unplugged in branches 1 and 2, and to effect a balance we have to unplug 250 ohms, the first two branches being equal, the galvanometer in branch 4 is also equal to the amount unplugged in branch 3; that is, 250 ohms. That this method may be clearly understood, we must go back for an instant to the principle of the bridge. We will see that if a balance is not established, and a current is flowing in the coils of the galvanometer, which will be in its usual place on the cross wire, the current will be denoted by the deflection of the needle; and, as a matter of course, any change in the resistance of the galvanometer, or of any part of the cross wire, will affect the strength of current in all of the four branches of the bridge. If, on the contrary, a balance is established, and the fact is indicated by the needle remaining undeflected, we may alter the resistance of the galvanometer, or even take it away altogether, without in any way affecting the current in the branches.

So, in measuring the resistance of the galvanometer by this method, when equilibrium is once attained, it matters not whether the key in the cross wire is open or closed; the deflection remains stationary.

The second method may be adopted, when the bridge cannot be used, and is as follows: Put the galvanometer in circuit with a resistance box and a battery, whose internal resistance is so small that it may be neglected; unplug any resistance, say 400 ohms, and note the deflection. We will assume it to be 20 degrees. Then put plugs back, withdrawing resistance from the circuit until the former deflection is doubled, so as to reach 40 degrees; there being then 300 ohms unplugged. Then multiply the two resistances by the respective deflections, subtract the smaller product from the larger and divide the result by the difference between the two deflections; thus, 400 ohms multiplied by 20 is 8,000; and 300 multiplied by its deflection, 40, is 12,000. Then 12,000 minus 8,000 leaves 4,000. That amount divided by 20, which is the difference between the deflections 20 and 40 degrees, gives us, as the resistance of the galvanometer, 200 ohms.

Q. 90. How may the electromotive force of batteries be measured, compared or estimated?

A. The electromotive force of a voltaic battery may be determined by several methods, but as no absolute standard of electromotive force is known, we cannot determine the force of any particular battery in standard units (volts), but can only compare the relative force of two or more batteries. We will consider several of the most simple and reliable methods:

1st. If we join up a number of cells in circuit with a number of other cells and a galvanometer, by adjusting the number of cells so that no current passes, and that consequently the needle has deflection, the relative force of the two batteries may be determined.

For example: We desire to know the electro-

motive force of a chromic acid battery of 10 cells, and we have a Daniell battery with which we can compare it. We know that a Daniell cell in good order is about 1.079 volts. We connect one pole—the zinc, for instance of—our chromic acid battery, to one terminal of the galvanometer, and the carbon pole to the copper pole of a battery composed of an equal number of Daniell cells; the zinc pole of the Daniell battery is connected to the other terminal of the galvanometer. We then find that the chromic acid battery causes the needle to deflect. We add cells to the Daniell battery until the needle deflects no longer. We find that we have added 10 cells. Thus it has taken 20 Daniell cells to balance 10 of the chromic acid cells; showing that the chromic acid battery has just twice the electromotive force of the Daniell, or in the ratio of 2 to 1.

To ascertain the value in volts, multiply the electromotive force of the Daniell cell, 1.079, by the number of cells, 20, and divide by the number of acid cells, 10. The quotient is 2.158, which is the value of the chromic acid cell; or, in other words, as the larger number of cells is to the smaller number, so is the electromotive force of the larger number in volts, inversely, to that of the smaller number.

The second method, using a tangent galvanometer, is as follows: The electromotive forces of two batteries, which we will call No. 1 and No. 2, are to be compared. No. 1 is joined up in circuit with a galvanometer and a resistance box. Sufficient resistance is unplugged to cause a convenient deflection of the needle. The tangent of the deflection must be noted, as must also the total resistance in circuit; that is, the resistances of the battery, galvanometer and that unplugged from the box.

Then remove battery No. 1 and substitute No. 2. If the internal resistance of No. 2 is different from No. 1, the resistance unplugged must be adjusted, until the total resistance in circuit is the same as before. Again note the tangent of the deflection. Then the electromotive force of No. 1 is to the electromotive force of No. 2 as the first tangent noted is to the second.

For example: Let No. 1 battery have a resistance of 60 ohms and the galvanometer 100 ohms. We unplug 800 ohms in the resistance box, making a total resistance of 960 ohms. With this resistance, we will suppose the needle deflects to 35 degrees. Referring to the table of tangents, we find that the tangent of 35 is .70.

We note the above facts and disconnect battery No. 1, substituting in its place No. 2, which has a resistance of 100 ohms. We alter the resistance coil to 760 ohms, to make the total resistance the same as before, *i. e.*, 960 ohms. We find the deflection now to be 42 degrees, the tangent of which is .90.

Then as .70 is to .90 so is *e. m. f.* of No. 1 to the *e. m. f.* of No. 2. In these measurements it is supposed that we know the *e. m. f.* of one of the batteries, which is called the standard battery; so, to reduce the calculations to figures, we will call No. 1 the standard, and assume it to have a value of 20 volts; and as .70 is to 20 volts so is .90 to 25½ volts.

The third method is that of Wheatstone, which is by many electricians regarded as the most elegant method in use. It consists in placing each battery alternately in circuit, varying resistance to produce the same deflection with each, then adding the required resistance in both cases, to produce lower but, again, similar deflections; the *e. m. f.*s then being directly proportional to the added resistances, which in both cases were required.

To illustrate: No. 1 battery, which we will suppose has a known *e. m. f.* of 25 volts, is placed in circuit with a galvanometer and a resistance box. We unplug say 2,000 ohms, and note the deflection to be 30 degrees. Adding 200 ohms to that already unplugged, brings the deflection down to 24 degrees. Taking out battery No. 1 and inserting battery No. 2, we find that to produce the same deflection—30 degrees, as at first produced with No. 1—we have to unplug but 1,800 ohms; and by adding 150 ohms, we bring the deflection down to that produced by adding, when No. 1 was in circuit, 24 degrees. Now, the amount added in the measurement of No. 1, that is, 200 ohms, is to the amount added in the measurement of No. 2, *viz.*, 150 ohms, as the *e. m. f.* of No. 1, 25 volts, is to 18¾ volts, the *e. m. f.* of No. 2.

Q. 91 What is a shunt?

A. A shunt may be defined as a contrivance for leading by another route part of a current which, as a whole, is too powerful for the immediate purpose. In the present connection, it is a coil of wire used to divert some definite proportion of a current aside from or past a galvanometer or other instrument, instead of allowing it to pass through the instrument coils.

For instance, if the galvanometer has its two terminals connected by a wire which includes a resistance equal to one ninety-ninth of the resistance of the galvanometer, we reduce the galvanometer to one-hundredth of its original sensibility, ninety-nine-hundredths of the current passing through the shunt, and the remaining hundredth through the galvanometer. Similarly, if the shunt be exactly equal to the galvanometer, the current will divide in equal proportions between the galvanometer and the shunt. If the shunt is one-half the resistance of the galvanometer, two-thirds of the current will pass through the shunt, and one-third through the galvanometer, and so on. The rule is that the current divides between the galvanometer and the shunt in inverse proportion to their respective resistances, the greater portion of the current always going through the smaller resistance, and the smaller portion through the greater resistance.

When very strong currents are being used in measurements, it is necessary that a shunt be employed, in order that the needle's deflections may be reduced to a reasonable limit.

Galvanometers are usually provided with three shunts, which are respectively one-ninth, one ninety-ninth, and one nine-hundred-and-ninety-ninth. These reduce the current passing through the galvanometer, respectively, to its one-tenth, one hundredth, or one-thousandth part.

Q. 92. What is the formula for finding what resistance a shunt should be to reduce the sensibility of a galvanometer to any required fractional part, and what is meant by the multiplying power of a shunt?

A. The formula for finding what the resistance of a shunt should be, to give it a definite value, is to make the resistance of the shunt equal to the resistance of the galvanometer, divided by the multiplying power required, minus one.

For example: Suppose we have a galvanometer whose resistance is 100 ohms, and we wish to prepare a shunt which will reduce the sensitiveness to one-tenth. We divide the galvanometer resistance by the fractional part to which we wish to reduce the sensibility, minus one; that is, we divide the 100 by 10, minus 1, which is, of course, 9. The quotient of 100 ohms divided by 9 is 11 ohms and one-ninth, which is the resistance of the shunt required, and is one-ninth of the resistance of the galvanometer. This is called a shunt having a multiplying power of 10. To obtain the true value of a deflection taken, for instance, from a shunted tangent galvanometer, we must multiply the tangent by the multiplying power of the shunt used. To ascertain the multiplying power of any shunt whose resistance is known, we divide the resistance of the galvanometer by the resistance of the shunt, and add one to the quotient.

For example: We are using a galvanometer with a resistance of 100 ohms, and insert a shunt whose resistance we know to be 25 ohms. To find out by what number we have to multiply the shunted result, we divide the 100 by 25, which gives us a quotient of 4, to which must be added 1, showing that 5 is the multiplying power required.

Q. 93. If we employ a shunt of a given proportion, is the current which then passes through the galvanometer strictly the proportionate part of the original current to which it is apparently reduced?

A. No, because by the act of employing the shunt we furnish a double route for the current, and thereby diminish the external resistance of the circuit, and as a consequence the strength of current furnished by the battery is increased.

It is, therefore, the increased current that splits between the shunt and the galvanometer, instead of the original one.

For example: If we are using a tangent galvanometer, and the tangent of deflection without the shunt is .80, we would naturally have supposed that on the introduction of a shunt which reduces the sensitiveness of the galvanometer one half, the tangent would also be brought down one half; that is, to .40. But such is not the

case, the result being some higher tangent than .40; and to bring about an accurate result, we must first find the joint resistance of the shunt and galvanometer, by the rules previously given for the calculation of joint resistance, and then insert an additional resistance in the battery circuit equal to the amount by which the original resistance was decreased. Thus, if both the galvanometer and the shunt are 100 ohms resistance, the joint resistance of the two is 50 ohms. In this case, therefore, we should have to insert 50 ohms in the battery circuit to compensate for the decrease in resistance, and to bring the current back to its original strength.

### The "Prism" Leclanche Battery.

Apropos of the new advertisement of the Leclanché Battery Company in the present issue,

Fig. 1

Fig. 2

readers of THE OPERATOR will be interested in the following description of the improved form of Leclanché battery, which we copy from the *Scientific American*.

The Leclanche battery is now more generally used for open circuit lines than any other, and its peculiar adaptability to the telephone service has given it an immense field of application. In the battery shown in the annexed engraving the porous cup used in the ordinary Leclanche element is dispensed with, and a pair of compressed prisms containing all the materials formerly used in the porous cup are substituted for it. These prisms are placed upon opposite sides of the carbon plate, and are kept in place by rubber bands.

The negative pole consists of a pencil of amal-

gamated zinc, and the two poles are suspended from the cover in a solution of sal ammoniac and water.

The zinc being indefinitely preserved in the sal ammoniac solution, and the peroxide of manganese being insoluble in the solution, no action can take place when the battery is not in use.

After thorough tests by various telephone companies, this battery has been universally acknowledged to be better than any other for telephone purposes, as all of its parts are visible, and any derangement may be at once discovered. The battery is readily taken apart, cleaned, and set up again. To do this requires no special knowledge of electrical apparatus. When the elements become exhausted from long service, they may be renewed by taking off the prisms, soaking the carbon below the head in hot water, attaching new prisms, and setting it up with a new zinc and a fresh sal ammoniac solution.

Further information will be furnished by the Leclanche Battery Company, 40 West Eighteenth Street, New York.

### The Boyce Fund.

In answer to the call for the voluntary payment of the insurance due on the life of Mr. John G. Boyce, the following subscriptions have been received, and the amount turned over to the parties in immediate charge of the fund:

The individual subscriptions for \$17.50 have already been acknowledged in these columns.

Making a total of.....\$144  
List not yet completed.

## How the Operators View the Consolidation.

To the Editor of The Operator:

SIR: When we compare the advance of the telegraph proprietors—and many of the present magnates were among the pioneers in the business—and observe their great opulence, it seems to me that they ought not to forget the operators who helped them to lay the foundations of their present great wealth, nor reduce their salaries, thus reducing them to serfdom; but, where they are reliable and competent, remember the services of the past and give them a chance to live.

J. L.

BOSTON, Jan. 19, 1881.

To the Editor of The Operator:

SIR: Is it not better to bear the ills we have than fly to others that we know not of?

This was the thought of many a telegrapher, a year ago, when the American Union was talked of, and especially those who had had experience with opposition companies. But it promised so much that men who had vowed they would stay by the "great monopoly" were won over to the side of opposition. Only a single year has passed, and now we are called upon to witness another consolidation. During the past year salaries have been steadily increasing, for which we must thank the opposition company. Many of us are but just beginning to feel the benefits arising from an increase of pay when comes the death knell to all our hopes. Past experience would certainly warrant the belief that we are again approaching starvation salaries. These thoughts may be premature. Let us, at least, hope so. Time alone can tell.

X.

ST. LOUIS, January 25, 1880.

To the Editor of The Operator:

SIR: They have consolidated! Confound the word *consolidate*. Swearing! Whoopee! How the boys are swearing all over this bright land of flowers, early vegetables and other disorders, and yet our little talking must be of a very mild order, compared with the remarks of our Northern and Western brethren.

Oh! it got here (the American Union, I mean). Yes, it did manage to reach us, but our climate didn't seem to suit its constitution, and just as the boys were waking up from their long sleep, rubbing their eyes and catching a slight glimpse in the near future (very near we thought) of old time salaries, and some of the ancient appreciation on the part of our bosses of our services, why presto! change, the bottom drops out, consolidation is announced and the dev—the monopoly has got us again.

Did you ever hear of Buck Boyd? Guess you never did, for that's the fictitious name I am going to hide a friend of mine behind, while I tell you a sad tale of "bursting" ambition and disappointed hopes, which concerns in some measure the aforesaid friend.

Well, Buck had been working for 10! these many months, and even years, for the Western Union. He was a victim of "sliding scales" and "jumping scales," "general reductions" and "special Southern reductions" until his salary barely afforded him a living, but, good fellow, plodded along and managed to exist on promises until patience ceased to be a virtue, if it ever was, and then, like many others of his oppressed brethren, he accepted a good salary and a handsome new office from the American Union right in town, where he had so long been serving the Western Union. All this came to my knowledge while I was hunting alligators in Florida, through a correspondence with the superintendent of the district. The first telegram reads as follows: "Want you to go to Slobtown and take charge at once. Can you oblige me? Answer."

That was the most civil telegram I had ever had from a district superintendent, and I knew something was in the wind. So before replying I stepped into the telegraph office and asked all the boys within reach if they knew why Buck had quit Slobtown. I was at last informed that he was going to manage the Slobtown A. U. office at a big salary. Then there came over me that spirit of independence which imbued our forefathers when they drowned some nice tea for a certain royal gentleman across the waters, and I quietly wiled the superintendent that Slobtown salary (which I knew well) was too small, and I was doing better (though, in truth, I was doing nothing but longing for that very job). Soon, very soon, came the reply, about thus: "Boyd

has gone to the opposition. Must have you at Slobtown to fight them. Will make salary all right." I came at once, the salary was made O. K., and I began a vigorous fight against Buck and the sprightly opposition. I fought Buck, I fought his handsomely uniformed messengers, I fought his call boxes, I fought his D. H. press reports, I fought his low rates. Oh! I fought him well (too well) for three whole weeks, and then—yes, then, even before I once had the ecstatic pleasure of drawing from the W. U. Co. salary commensurate with my distinguished services, the things went and got married, and now neither Buck nor I can tell where we are. Has the W. U. gobbled up the A. U., or has the A. U. swallowed up the W. U.? Did Gould beat Vanderbilt or vice versa? We don't know, but little does it matter with us. Those salaries are coming down and that is what is the matter with Buck and I.

Poor Buck! I am sorry for him, because he expected promotion. It had been promised him by the A. U., and Buck is an ambitious kind of a fellow. He came over to see me last night, and, among other things, he said he felt like getting drunk for the first time in ten years, and, added he: "Rat, old fellow, when I get real mellow I want to smoke a genuine ten cent cigar. Then I can watch the smoke as it curls gracefully upward and learn the route my hopes have gone."

As I before remarked, poor Buck!

DIXIE LAND, Feb. 1881.

RATTLE TRAP.

## Don't "Go West."

A correspondent on the U. P. Railway writes as follows with regard to the relative merits of the East and West in the matter of telegraphic employment:

"The disposition with most of the telegraphers in the Eastern States has been to go to the West, where salaries are supposed to be better and money growing on trees. With eagerness and high anticipations, many have found their way to this land of milk and honey, and have, to their heart's content, tasted the sweets of the Far West. It is a fact beyond doubt, that the entire Western country is flooded with idle operators, all having flocked West with a mistaken idea; and, while throughout the East there is a general demand for operators, here there is but little demand, with hundreds of men ready to fill the vacancies. Many are opening their eyes to the fact that the chances are comparatively better in the East for good operators. In point of salaries there is nothing gained by going West, as living is much more expensive and the change does not justify any one to come West. There are a great many who are daily leaving the West and going back East, and unless a man can afford to lie around a month or so, or has a rich uncle back East to furnish him current funds, he had better stay East."

## How a Government Telegraph Rushes Press Dispatches.

We glean the following from the *St. James' Gazette* (London): Mr. Cameron, the able correspondent of the *Standard* in Afghanistan, first heard of Ayoub's defeat from some straggling Afghan horsemen, and as this would be an excellent "beat" on all the other London papers, Mr. Cameron at once galloped fifty miles with the precious news to be telegraphed to the *Standard*. Major Crawford, the commanding officer, instead of permitting the exclusive dispatch to be sent to the *Standard*, as it was directed, "sent the news" (We quote verbatim from *St. James' Gazette*) "first to the government and Sir Robert Sanderson, and the Commander-in-Chief, and then indulgently allowed it to be transmitted to the *Standard*," thus depriving that paper of the advantage of prior and exclusive intelligence of a great victory.

It is a crumb of comfort to know that Major Crawford has been "admonished" for his crookedness, but a government line on this side

of the water would show up some men who could discount the Major on the subject of gerrymandering private dispatches.

## Can this be Utilized as a Big Battery?

Some time ago the *Tribune* had occasion to call attention to the Ada mine, on Snake creek, in this territory. It will be remembered that mention was made of a strange kind of rock found in the tunnel of that mine that emitted a bright glow, as phosphorus does, when rubbed or hammered on with hammer or pick. This was at the time classified, for want of a better name, as phosphuretic rock. The miners in the district called it "hell's fire rock." R. N. Baskin, owner of the mine, recently forwarded some samples of this strange rock to the professors of chemistry at Yale College. On careful analysis it was found to contain no phosphorus, as at first surmised. The gangue was easily determined; but the subtle power that gave light to the rock baffled the sages of New Haven, and the broad term magnetic or electric rock was given to it. In this progressive age, when gas and coal oil begin to take a back seat, this discovery of a mountain of ready-made electricity may become a source of incalculable value to its owners. Our local telegraph offices need only run a wire from the Ada tunnel to their instruments to obtain a permanent supply of electricity. The trouble and expense of replenishing batteries, replacing broken jars, etc., would be entirely dispensed with and "hell's hole" home-made lightning always on hand free of charge.—*Salt Lake City Tribune*.

## Funeral of Edward G. Bradstreet.

The funeral of the late Edward G. Bradstreet, who died on the 26th ult., took place at Rochester, N. Y., Jan. 29, and was very largely attended by the friends of the family and members of the telegraphic fraternity. During the services a quartet of voices rendered several very affecting and appropriate selections of music. The floral offerings were elegant in the extreme. Members of the telegraphic fraternity who were in attendance from Buffalo contributed a pillow composed of the most beautiful flowers, upon which were the symbolic figures, "30." This beautiful offering was placed at the head of the casket. On the casket was a standard of flowers also contributed by the Buffalo operators, upon which were erected two telegraph poles, connected by three wires, one of which was broken. There were also other beautiful offerings of wreaths and crosses. The following operators acted as pall-bearers: W. J. Stupp, James C. Bryan, Dennis Moynihan, C. E. Terry, A. C. Orr and W. H. Lothredge. Among the members of the telegraphic profession who were in attendance at the funeral were the following from Buffalo: E. W. Abrams, A. C. Orr, C. E. Terry, F. Roesch, P. Smering, M. H. Thompson, F. L. Gardner, W. H. Mack, George W. Hann, G. J. Volger, W. H. Pinkney, M. O. Hoffman, G. H. Usher, E. C. Lapey and S. A. Farley. At a meeting of telegraphers at the American Union office, Buffalo, on the 28th ult., resolutions were adopted deploring the loss of Mr. Bradstreet.

## The Conklin Signals.

The Conklin Electric Signals, already referred to in these columns, and advertised in the present issue, have been in successful operation at several points on the elevated railways in this city for nearly a year, and give the most complete satisfaction. Fear was expressed, when they were first put up, that they would not work in the event of heavy snow. Throughout the recent unusually heavy snow and sleet storms, however, when all the telegraph wires were crushed to the ground and useless, these signals worked with what the *Elevated Railway News* calls the precision of interest accumulating on an unsettled account. In the words of the same journal, the Conklin electric signals are a success. The inventor of these signals is a well-known operator and manager on the Harlem Railroad.

Their construction is very simple, and they are entirely automatic in their working. An insulated iron bar is placed parallel with the rail at

any point desired, which, the engine passing over, an electric circuit is formed, and the danger signal immediately displayed. As the red disk swings into sight, an iron catch firmly locks it in its place, from which it cannot be shaken or jostled, but remains firmly fixed until the current is reversed and the armature brought down, when it swings again into its normal position of "safety," leaving the glass clear.

### The Chicago "School of Telegraphy."

EIGHT DOLLARS' WORTH OF FREE ADVERTISING CHEERFULLY GIVEN.

Owing to the scarcity (*sic*) of operators, the College of Telegraphy has been established in Chicago. It is proposed to place it in the reach of every one who wishes to avail themselves (*sic*) of this easy and honorable mode of earning a living, hence terms are made unapproachable. For a full course of instruction in all branches, commercial and railroad telegraphing, fire alarm, duplex, quadruplex, repeaters, etc., for \$40, payable \$10 upon entering, \$5 in one month, \$5 in two months, and \$20 after having learned, secured a position, and earned the money. Having made arrangements with all the leading companies and railroads to furnish them operators, we can guarantee a situation in every instance. Two months will qualify any one with ordinary intelligence to take a position. The money that is paid will barely cover the cost of learning. We furnish everything—instruments, ink, paper, pens, battery, etc.; you are at no expense except the tuition fee, and we wait for all our profits until you have earned it. This makes it to our interest to advance the student as fast as possible, and secure them (*sic*) positions, and makes our interests mutual.

*We want fifty operators to fill positions on May 1 for one company.*

We can give the best reference in the city that we do what we agree in the future as in the past.

*P. S.—Bear in mind we furnish all text books, manuals, etc., free of cost. NO INITIATION FEES. The only cost is tuition, as above.*

*Board and lodging, \$3.00 per week.*

N. J. SAVIERS.

### A Hope Fully Realized.

FEW people stop to think of the vast proportions to which telegraph investments have grown. An esteemed contemporary shows that an original investment of \$10,000 in Western Union is now held at \$481,700 and that the cash dividends have amounted to as much more. Contrast this exhibit and the eighty millions of dollars representing the new combination, with the following modest letter, written by Professor Morse to the assistant superintendent of the U. S. Magnetic Telegraph at Baltimore, thirty-six years ago. Observe the "hope that the receipts of each office will soon mount up to at least five dollars per day!"

"NEW YORK, MAY 24, 1845.

"DEAR SIR: I received yours inclosing Mr. Sanders' letter, which is an excellent one, and comes just now quite apropos. I showed it to the editors of the *Journal of Commerce*, who will make an article out of it, perhaps on Monday. If you are not in special want of the original letter, I will bring it with me when I come on, which will be in about a week. I have not had time yet to look after stamps for office, but will have them in hand soon.

"I am busy with the instruments. Telegraphic matters look well.

"I want all the minutiae of the last pranks of the lightning. You can give them to me when I see you.

"I hope the receipts of each office will soon mount up to at least five dollars per day; that sum will just pay expenses, exclusive of my salary and Vail's.

"Give my respects to Mrs. Rogers.

"Hoping soon to see you,

"Truly your friend and servant,

"SAM'L F. B. MORSE.

"HENRY J. ROGERS, ESQ."

### Chicago Notes.

*To the Editor of The Operator:*

SIR: Nothing definite or reliable to report regarding the near consequences of the consolidation upon the numerous offices and operating forces in this city. Many startling rumors have gained circulation to the effect that there is to occur a general "shaking up of dry bones" in official departments (and many an operator has thus found some consolation in the fact that he is not an official).

The *Inter-ocean* newspaper, of this city, and the *Pioneer Press*, of St. Paul, have conjointly leased from the Western Union and Northwestern Telegraph companies two wires, one to Washington and one to St. Paul, over which specials are nightly handled in the liveliest manner. Johnny Walker works the Washington and Dick Ledwith the St. Paul side, both elegant gentlemen and expert knights of the key.

About fifteen couples from our office recently took advantage of the fine sleighing to glide out to Englewood, a Chicago suburb about 10 miles out, where they joined in a merry dance, and supped sumptuously. During the return toward the city, and while yet too far away to even catch the glimmer of the limit lamps, they came to an inglorious "standstill." The huge conveyance had broken down hopelessly, and most of the party had either to walk in, or wait long hours for a passing train. They arrived home about 7 A. M., cold and weary, a solemn procession, in sad contrast to the gay and happy load of the evening before.

Off on vacations: Ed. Dodge, C. S. Alberts (sick), Miss Coates.

Returned from vacations: W. L. Cullen, Geo. Stapley, Billy Baker, N. Callett, Ed. Quick, and lastly, but not leastly, Mr. Frank Minor and bride (late Miss Goldsmith), to receive showers of hearty congratulations from numerous friends.

Several weeks ago a number of prominent operators met and formed a ball association. Mr. J. E. Pettit, assistant manager W. U., was elected president; Mr. E. P. Whitford, chief operator, secretary; D. L. Wilson, treasurer. The seventh annual ball is to be held on the night of Thursday, Feb. 24. Every effort will be used to make this the most brilliant and pleasurable gathering of telegraphers and their friends ever witnessed in this city. The best hall in Chicago for the purpose has been engaged, and the music and supper will be first class. Special arrangements have been completed for livery rigs, hotel accommodation, and every necessary convenience. The unique feature of the occasion will be the presence of Dr. Price's elegant perfumery fountain. Eight hundred invitations have now been issued, and deputations from Omaha, Cincinnati, St. Louis, Detroit and other places are assured.

We notice the following on committee of arrangements: A. C. Knapp, Manager Board of Trade; O. M. Stone, Manager A. & P.; L. B. Firman, American District; B. E. Sunny, Bell Telephone; C. B. Burch, American Union. Invitations can still be had on application to the secretary.

Manager Maynard had a narrow escape from being overcome with an elegant testimonial on Christmas Day. The subscription list was barely started, by some kindly-disposed individual, when Mr. Maynard, accidentally learning of the fact, immediately and earnestly requested that it go no further. The wisdom of his action, your correspondent believes, merits high commendation, and is worthy the emulation of other officials. There are, doubtless, but few who would begrudge Mr. Maynard the well-earned reputation of a popular and efficient manager, yet there are questions and principles (to say nothing of good taste) involved in the way of extravagant testimonials from employes to officials that he has no doubt recognized. The relations between the management and operators in an office of the magnitude of the Chicago Western Union office, where upward of a hundred and fifty men are employed, are peculiar and quite unlike those in the smaller interior offices, where you can count the number constituting "the force" upon the fingers of one or both hands; where honors are easy, and where official dignity may, if it chooses, get down off its pedestal and "swap lies" with the boys.

Here the manager must needs hold himself

in reserve, in an office by himself, apart and retired from the operating room. He communicates with an operator when he (the operator) is sent for, and the nature of the interview, as a rule, pertains strictly to business. He (the manager) must necessarily have few, if any, intimacies—that is, nine-tenths of the subordinates know him only in the cool and formal transaction of his official duties. He entertains no questionable bids for favor from any source whatsoever. The needs of the service are first considered, and the system of promotion extends only to those who are adjudged best qualified to attend to the detail or routine work assigned them. Hearty friendships are rarely formed between the manager and operators. There is a high fence of separation to any thing like such familiar intercourse, and each side finds a certain kind of pleasurable interest in keeping the fence in constant repair. The consequence follows that when a subscription paper is started for the purposes above mentioned, no matter what the motive of the starter, it actually goes begging. The required number of names might be obtained, and the purse might count out a magnificent sum of money, for the reason that, *under the circumstances*, few would have the hardihood to turn their backs upon an affair in which all were urgently invited to participate, yet how many of the number would be moved to sign their names by any feeling of affection, or even the charitable feeling that "it is better to give than to receive?" Of course, if the really intimate friends and ardent admirers of an official—no matter what the grade of their positions—should desire to testify their affection and admiration in the shape of an appropriate token, it would not be within the province of those less interested to question their motive or right to do so. The question of propriety would only arise when the solicitations for contributions became general, and should reach the eyes of many who would look upon the affair either with placid indifference or positive derision, and thus defeat and degrade the object and purposes sought to be furthered.

Your correspondent feels no hesitation in joining with all others so disposed in according our manager, socially, the title of a genial gentleman of well known distinction; and, officially, in testifying that his rulings appear conscientious and just, and that in his dealings with unfortunates and delinquents, he has, of late, in many notable instances, shown himself charitable and generous to a fault.

INEWRI.

CHICAGO, Feb. 6, 1881.

### The A. and P. in Chicago.

*To the Editor of The Operator:*

SIR: Your paper is read and enjoyed very much by the employes of this, the A. & P. office, but we feel slighted on account of not receiving any notice from your able correspondent in this city. We have, therefore, come to the conclusion that we had better puff ourselves at least once before the "end of the world." The boys consider the consolidation "the end of the world" to them, and that Mother Shipton's prophecy has come true.

Last spring, when the boom struck us, the office contained six men. Since then there have been from fifteen to twenty employed here. Our manager, Mr. O. M. Stone, is a gentleman from the sole of his number elevens to the crown of his seven and a half hat, and is universally liked by all. Mr. Gus Carroll, day chief, is a good humored young man, and there is not a man in the office but will work "eyes dim" for him. Mr. Chet Spencer is assistant day chief, and is assisted by Mr. "Jack" Wilbee. Mr. Fred Kreuzmarck works Cincinnati. John Robb is on Pittsburgh and St. Louis. Mr. Sam Miner sends reports to Omaha and handles all Southwest business. Mr. C. F. Patterson works Cleveland and Detroit wire. He has been out to Hot Springs for his health, and is much improved. On Board of Trade we have Mr. Ed. Angell, manager, whose rotundity of person is only equalled by his geniality. Mr. Emil Friend, our operatic critic, and the oldest man in the employ of this company in Chicago, works the Grand Rapids wire. He carries the "Chimes of Normandy" in his pocket. Mr. F. W. Kinne makes it lively with C. N. D.'s for Ottawa and Burlington.

We have an apartment exclusively for the

ladies, dubbed by the facetious "the Harem," in which Mrs. Tillotson works Milwaukee and Lafayette wires. Mrs. Prescott works South Water street and hotel wires. Her copy is a marvel of neatness and beauty. Miss Wiley works the stock yards and metropolitan wires.

On the night force are Mr. E. M. Myers, chief, and Mr. Sam. Derrickson, all-night man. The operators are: E. G. Foote, Andy Brady, Johnny Dwyer, Bill Long, and Messrs. Morris and Northway, who send reports west. Two day men work extra until 11 P. M.

At Christmas our manager was presented with a silver tea set, seven pieces, by the employes, which was a complete surprise. Gus. Carroll was the recipient of a gold-lined silver tobacco box, inscribed upon which was this: "Christmas, 1880, to A. C. Carroll from the Boys." The gift was greatly appreciated by Mr. Carroll, as showing the good will of his subordinates. Mr. Patterson received a case of Lubin's best. We all think it was presented to him by the ladies.

Wishing THE OPERATOR all the success in the world, we remain, yours fraternally,

A COMMITTEE.

CHICAGO, Jan. 26, 1881.

### The Telegraph in Denver.

To the Editor of The Operator:

SIR: Twelve months have witnessed wonderful changes. A year ago Denver was classed as an ordinary country office, requiring but two operators to handle the business. To-day ten men find employment in the W. U. office. Telegraphic communication with the interior of the State was quite limited; now there is scarcely a corner that we do not reach. But four wires entered this office a year ago; there are now twenty-one. Several old-timers were at various periods numbered among the force here. Conspicuous among them were Schermerhorn, Ed. Foote, Barney De Keyne, L. M. Smith, Fred. Loomis and John Smith. No one seems to know the whereabouts of "Skimmy." Ed. Foote, Fred. Loomis and John Smith have both been in the employ of the Denver & Rio Grande R. R. in this city for a year past.

Tom Fenton, our worthy and esteemed chief, has grown old in the service and is very popular. He has traveled extensively in this country and Europe, and is contemplating a trip to France during the coming summer, to investigate the workings of European telegraphs. Messrs. Todd and Warren have been in the service for at least twenty years. Mr. Todd is well known on the Pacific slope. George Warren, formerly of New York, has been here since last May and has shown himself to be a good, reliable man in every respect. He has decided to return to "N. Y." in the spring.

The remainder of the force consists of younger men, but all of them good operators.

There is much dissatisfaction with the small salaries paid. This office ought to pay at least ninety dollars to a good man, yet one may consider himself lucky to obtain seventy, although it costs from forty to fifty dollars per month for board alone. Operators can, therefore, do better East, and ought not to come this way, unless to benefit their health. More money can be saved out of a salary of \$50 in the East than \$80 here.

COLORADO.

DENVER, COL., Jan. 18, 1881.

### Cleveland Chronicles.

To the Editor of The Operator:

SIR: As considerable has been said lately of the Brush Electric Light, which illuminates a portion of New York City, it may be well to mention that Mr. Brush is, of course, an Ohio man, and further a Cleveland man. The company's extensive works are located here and give employment to several hundred men in their various departments. We are informed that a fifty thousand dollar order in one day is not an unusual occurrence. We exceedingly regret to chronicle the serious illness of Mr. Edgar W. Collins ("I dunno"). Although the doctors have great hopes of his final recovery, Mr. Collins is at present in a critical condition. Mr. George A. Lied has been appointed night manager of the A & P office, vice Mr. Griffin, resigned. Mr. Griffin came here from New York, and, we understand, has now re-

turned to that city, where he is connected with the A. & P. It is generally believed here that the consolidation will have no material effect upon operators, although some of them are wearing rather long faces. However, no one has received official notice that his services, etc. Among the late arrivals is Dickie Kaine, from the A. U., at Columbus. Dick can spread more ink in artistic chirography on a number one blank than any Spencerian College professor in the city. Mr. Al Babb and Mr. J. M. Cronenberg, the former of Chicago and the latter of Toledo, dropped in to see the boys a few days since. Both gentlemen were formerly operators in this office. It is rumored here that Fred Cooke, who works the New York end of the Cleveland quad, is about to consolidate. His friends in Cleveland wish him much joy, and, as our friend Gurley says, "May his cares be as scarce as hens' teeth." Lou Seibel is the happy father of a handsome boy.

BRUTUS.

### TELEPHONE DEPARTMENT.

There is, apparently, much dissatisfaction in Washington, D. C., with the management of the local telephone company.

While the American Union and Western Union operators are in a corybantic frame of mind, the telephone men smile complacently.

The telephone exchange at Taunton, Mass., is under the control of the Southeastern Massachusetts Telephone Company. Mr. Abner Coleman is the agent at Taunton.

Although it would only cost \$25 per session, and be a great convenience to members as well as others, the Pennsylvania House of Representatives at Harrisburg refused to have telephonic connection made with the railroads and hotels of that city.

A committee of Councils in Philadelphia has reported in favor of granting permission to the Bell Telephone Company to erect poles in that city, with the proviso that the company shall place their wires under ground when the system shall have been found to be successful.

Disagreements have arisen in England with regard to the management of the "United Telephone Company." At a business meeting, the other day, the discussion developed the astonishing fact that two men—Messrs. Scott and Wollaston—who had paid \$3,500 for their privilege of acting as the company's agent for the sale of telephones, are now being offered \$150,000 by the company to cancel the agreement.

Among other telephone companies not frequently heard of, besides the Bell Company, are the People's, of New York; the United States Telephone Manufacturing Company, of New York; the Eaton Telephone Company, of Brooklyn; the Hartford Company, of Hartford, Conn.; and the Law Telegraph and Telephone Company, of New York. Against some of these the Bell Company has begun infringement suits.

Mr. Gower's form of Bell telephone has been adopted by the British Post-office authorities, who have given an order for 20,000 of the instruments. It has been tried on the Southwestern Railway, England, with much satisfaction in communicating with the signal cabins on different sections of the line. The telephones were simply connected between the existing wire for working the "block" system and the "earth." Conversation was then distinctly carried on without interfering in the least with the ordinary signals. It was interesting to hear through the telephone the sound of the train itself leaving the distant station at the same time as the strokes of the signal bell announced its departure.

The *Electrician* describes a microphone invented by M. Boudet, of Paris, which transmits articulate speech very distinctly without altering the tone or causing any scratching noise. It is composed of a mouthpiece of the usual telephone kind, joined to the end of a glass tube, a centimeter in diameter, which is mounted on a jointed stand. The mouthpiece contains an ebony plate, one millimeter thick, to which is attached a piece of copper, penetrating the glass tube a little distance. In the tube are six carbon balls. At the end of the tube there is a piece of copper, which imparts the necessary degree of pressure to the carbons. In its action this microphone of multi-

ple contacts is like an ordinary middle-sized Gaiffe microphone, with six elements—peroxide of manganese and chloride of zinc—set up with a resistance of 800 ohms, with a Bell telephone for the receiver.

### DASHES HERE AND THERE.

The Brest-St. Pierre cable of the Compagnie Française du Télégraphe de Paris à New York has been repaired at a distance of forty miles from Brest.

Rolled Gold Solid 18 K. Rings, with initial or motto engraved, sent on receipt of 75 cents in postage stamps or currency. Read advertisement of G. Pettibone & Co. in this issue.

In England Mr. Fawcett has handed over to the Civil Service Commissioners the right exercised by previous postmaster generals to nominate candidates for the telegraph service.

Sanford's Liver Invigorator, advertised in another column, enjoys a very enviable reputation. A neat little pamphlet in reference to the Invigorator will be mailed free on application.

Montreal telegraph stock has fallen considerably in price on account of the consolidation of the American companies. An effort has recently been made to raise the price, by buying Montreal stock in the name of prominent Western Union officials.

Dr. Werner Siemens has applied electricity to the operation of elevators. His system, which operates through the transmission of power by the dynamo-electric machine, is as safe as the hydraulic system, and is claimed to be far less costly and inconvenient.

A new French appliance is an electric brake, which is made to operate on the wheel brake by means of electricity generated during the motion of the train and applied at pleasure. Experiments thus far made with this apparatus have been entirely successful.

A committee of Councils in Philadelphia has reported in favor of granting right of way in that city to the Mutual Union. The ordinance also provides that the said company is to give bond for \$20,000 that it will not amalgamate with any other telegraphic company.

A bill to incorporate the Mexican Southern Railway has been introduced in the Senate at Albany. It will build and operate railroads and telegraphs in Mexico. The bill names as incorporators U. S. Grant, Jay Gould, Porfirio Diaz, Russell Sage, Sidney Dillon and others. Thus it will be seen that the telegraphic field is still opening to us.

We would call attention to the new advertisement in this issue of Mr. H. Thau, 128 Fulton street, New York. This is an old established house, and in every way reliable. The only fault to be found with Mr. Thau is his modesty in the way of advertising. We hope, however, that in future he will let telegraphers know through our columns where he is and what he has to sell.

The manufactory of the Western Electric Manufacturing Company, Nos. 63 to 68 New Church St., this city, in which was stored a large number of telephones and telegraphic instruments, was damaged by fire on the 9th inst. to the extent of \$25,000. Messrs. J. H. Bunnell & Co., of 112 Liberty street, lost \$1,000 by fire on the same night, though this will not in any way interfere with their business.

A bill introduced in the legislature at Albany on the 25th ult., relating to telegraph wires in New York City, provides that after July 1, 1882, all telegraph wires within the city used by telegraph, telephone, district messenger, or electric light companies, or any corporation or person whatsoever, must be laid underground in such manner as may be agreed upon between the Mayor and the owners of such wire.

The Union Electric Manufacturing Company have just started in business in this city under favorable auspices. Mr. C. D. Haskins, an old-time operator, who was for several years in charge of a department in the factory of the W. U. Telegraph Company, is superintendent of the new company, while Mr. J. T. Covel, well-known among purchasing telegraph and telephone men by reason of his connection with the Western Electric Manufacturing Company, is general manager.

An advertisement of the Peck Artificial Ear Drums will be found in the present issue. These are the only artificial ear drums for which a patent has been granted. They are very highly spoken of and warmly recommended by physicians and those who have used them. Mr. Peck has published a neat 24-page illustrated pamphlet, which he calls "A Concise Treatise on Deafness;" in it he fully explains the mechanism of the ear and the causes and curability of deafness, also the new invention, its construction and benefits to the deaf. Copies will be mailed free on application.

At a meeting of alleged operators in London, recently, to agitate the subject of increased pay, Mr. A. S. Coates, senior "clerk" of the Central Station, used the following language: "Until within the last few years they had been called clerks, but suddenly and without warning that title had been changed, and they were now called 'telegraphists.' He did not know what they had done to deserve that title." An average American operator who watched them working their pump-handle keys would also wonder "what they had done to deserve that title." We call them "plugs" here.

The cable message from London to Australia respecting the Hanlan-Trickett match in the former city, was an extraordinary achievement in telegraphy—in fact it has never been excelled. The total extent of lines, namely, 12,000 miles, was traveled in one hour and twenty minutes. The greater portion of this time was occupied in transmitting the message through India. From Singapore to Sydney, 5,070 miles, the message occupied only thirty-five seconds in transmission. This message was repeated fourteen times from station to station between London and Sydney.

A dispatch from London, on the 31st ult., says that a prospectus has been issued in Paris of the Central American Submarine Telegraph Company, the object of which is to connect all of Central America with the United States and Europe by cable—with tributary land lines—to be laid from Balise to Cuba, Spain having granted a concession therefor. England will guarantee for a term of twenty years the payment of the sum of £1,000 annually as the proceeds of government dispatches to and from British Honduras. The capital of the company is to be £120,000.

The committee on mercantile affairs of the Massachusetts Legislature heard, at Boston, on the 4th inst., the petition of Chester Snow, J. N. Stover and others for incorporation as "The States Union Telegraph and Telegraph Construction Company," for constructing, maintaining and operating lines of telegraph in any part of the United States and Canada. The capital proposed is \$500,000, with the right to increase it to \$15,000,000. It is stated that it is the intention of the proposed incorporators, if they get a charter, at once to commence the construction of 8,000 miles of the American Rapid Telegraph in various parts of the country.

In speaking before the Senate committee at Albany, Feb. 9, Dr. Green, president of the Western Union Telegraph Company, referring to the Moller bill, now pending, to force all telegraph companies to put their wires under ground, said that he hoped the Legislature would move cautiously. With the experience of a few days ago fresh in mind, the Western Union Company proposed to lay a number of through wires under the surface, as soon as it had decided upon the most practicable plan. But if it were forced to lay every wire out of sight, it would shut off three-quarters of its branch offices to hotels, etc., and would ruin the business of the telephone and district telegraph systems.

The agitation for increased pay continues among the operators in England. The Postmaster General, speaking at Manchester, on the 4th ult., he alluded to the discontent existing among the post office telegraphists with regard to pay and promotion, and promised that their representations should receive his most careful consideration, and that if he found he required more facts he would ask some of the provincial employes to come and see him in London. In answer to an inquiry from one of the Irish members of Parliament, the Postmaster General gave a similar assurance, stating that he would spare no pains to arrive at a just conclusion with regard to the alleged grievances.

Some French physicists contend that the musical notes produced by Prof. Bell in disks of mica, india-rubber, metal and wood, by holding them in the path of a rapidly interrupted beam of light, are really due to heat and not to light. M. Mercadier has obtained like sounds from ordinary gas-lamps, without employing lenses to concentrate the interrupted beam, by simply bringing the receiving disk near the source of light. Even a plate of copper heated to bright red produced very distinct musical notes, which died gradually away as the plate cooled to a dull red. Disks coated with silver on the side exposed to the ray gave very feeble sounds, but when coated with lampblack the sounds were strong.

The annual meeting of the Dominion Telegraph Company was held at Toronto last week. The receipts of the year were \$229,994, being an increase over last year of \$31,455, or 15.89 per cent. The increase in mileage of wire during 1880 was 1,450, and the number of additional offices opened 58. The American Union having fulfilled the terms of its lease to the letter, resolutions were adopted authorizing the board of directors, under the advice of counsel that the interests of the shareholders of the company are fully protected, to sanction the transfer and assignment to the consolidated companies of the lease made by the American Union.

St. Paul, Minn., is boasting over the possession of a boy, ten years old, whose left hand is a wonderfully strong magnet. The Minneapolis Tribune says that metal articles of light weight attach themselves to his hand so that considerable force is required to remove them. Knives, pins, needles, buttons, etc., enough to cover his hand, will thus attach themselves so firmly that they cannot be shaken off. With heavy articles, however, the boy complains of sharp pains darting along his arm. In a less degree his left arm and the whole left side of his body exerts the same power; but it is not at all manifest on his right side.

Edison has just been beaten in the Patent Office, in the suit regarding the invention of the Edison as against the Maxim electric light, both of which are similar. The Examiner of Interferences has decided that Edison was not the first inventor, and that the patent must be issued to the United States Electric Lighting Company, representing the Maxim claims. This is the famous platinum lamp, which created such a panic in gas stocks about two years ago, and sent the stock of the Edison Company up to an almost fabulous figure. It is claimed by the United States Company that other important contests relating to incandescent lighting will now be decided in its favor, as it was the first in the field in this country.

Mr. John McKee, proprietor of a livery stable in Pittsburgh, has lost his life in consequence of a telegraphic "bull." Mr. McKee was in Greenville, Pa., about February 1, when he received a telegram from home announcing that "the old man" was dead. The agitation that such an announcement would naturally create was no doubt increased by the apparent flippancy of the message; at all events, Mr. McKee prepared to return home immediately. He had but a short time in which to catch the train, which was already in motion when he arrived at the station. To further complicate matters two women who had stopped on the platform to kiss got in his way, and the result was that in trying to get on the cars he fell under the wheels, and received injuries which caused his death several days later. It afterward turned out that the message which led to this unfortunate train of events had reference to a valuable mare which had been driven to death by a drunken man, and should have read "The old mare is dead."

A Western Union Telegraph operator last evening sent a sealed dispatch to this office addressed as follows:

M. A. RINE,  
Editor North American.

It was brought to the editorial rooms, and there arose a lively discussion as to whether it should be received and opened or not. There is no member of the staff named Rine, and the news editor racked his brain in vain trying to make out from his knowledge of the telegraphic alphabet that it was a miswriting of the name of somebody attached to the establishment. At

length he decided that he had the constitutional power to go behind the returns, having charge of telegraphic news, and did so at the risk of opening another man's private telegram, reasoning that a telegram sent to a newspaper office presumably contained news for the paper. The envelope was found to contain some shipping intelligence for the marine editor, and a grand union roar of laughter resounded through the building, so loud that it knocked two editorials and a display advertisement into pi.—*Philadelphia North American*.

The Central News, a press association of London, has established a printing telegraph system for reporting the doings of the Houses of Parliament to the leading London daily papers as well as the London offices of several provincial journals. The work was and still is all carried on under the supervision of Mr. Henry Van Hoevenbergh, of this city, who went to England especially for that purpose. Under date of Jan. 26 Mr. Van Hoevenbergh writes: "All of the papers use the news every day, which is the best evidence of its practical value. The system is perfectly organized and works like a charm. Yesterday the House met at 4 P. M., and continued in session until 2 P. M. to-day, the instruments giving to all of the subscribers a full report of the proceedings, 22 hours of continuous working, during which time not an instrument lost a word of the report. I think this is something unprecedented in the history of reporting telegraphs, and, for a new system, is wonderful. We have a Morse line (Continental alphabet, of course) from the house to the Central News office, and the news is read to the transmitting operator, who sends it over the instruments. The printers kept up with the Morse throughout the report, and when the House adjourned, at 2:05 to-day, it was on the instrument at 2:07. The papers cut off the tape at regular intervals and paste it to the sheets, from which the compositors set it up."

When the stock service and the news service of the Central News is complete, they expect to use about 4,000 instruments. The instruments are all made by Messrs. J. H. Bunnell & Co., of this city, who have now under way a large order for them.

In our December 1 issue we noticed the case of little Freddie Balder, of San Antonio, Texas, whose mother told him God would punish him if he misbehaved. We chronicled the fact then that on the 11th ult. Freddie went home from school, and finding his parents gone, went to the cupboard, sliced off a piece of bread, buttered it, then went to the front of the house, sat down on the gate-post and began eating. In a few seconds a stroke of lightning knocked him off the fence, burned up his hat and his shirt bosom, singed his eyebrows and hair, and left him in danger of becoming both blind and deaf. Later advices from that region show that the incident has caused great excitement, as it was certainly not an ordinary flash of lightning which struck the boy. His eyes are tightly closed and swollen, while his face is marked with plain red welts, more like the cuts of a whip than burns. The boy himself says somebody shot him, although the skin is not broken in any place. His little sister says the fire came from above and passed from where Freddie sat around the house toward the ditch and then disappeared. The curious incident has led to the recital of similar cases occurring in that region, notably one of a gentleman being so struck while riding in a stage, and half of his body being burned to a blueish color. Dr. Graves, of San Antonio, expresses the opinion that the burn was caused by thermoelectricity, from the fact that the flame was seen to take a circuitous course, after passing the boy, while an aerolite invariably keeps on a straight line, in the direction of the earth. Dr. Graves also says the color of the burn indicates that it was electricity. The doctor says the stricken child is in a critical condition.

## NEW YORK CITY ITEMS.

### Echoes from 195.

The lady operators thought the sleet storm was "just splendid," as they were excused for two days.

The consideration shown by Chief Leslie for

the operators under his charge during the trying time at Williams Bridge is much appreciated by the men.

Mr. Jim Lewis, a new arrival from Indiana, stands 6 feet 1, and weighs 220 pounds. He has consequently escaped the usual series of jobs and jokes that new arrivals are subjected to.

Mr. James Lewis, of Jeffersonville, Indiana, now of 197 Broadway, was united in marriage Jan. 25, by the Rev. Henry Morgan, in Boston, to Miss Lizzie S. Cope, of Louisville, Ky.

The operators at 195 are much gratified at the liberality of the company in allowing the claims of all expenses incurred by them during the storm, and for what might, in some cases, be called excessive claims for "extra" service.

The election of Mr. Conrad Myers as Assistant Chief Operator was confirmed by Manager Dealy. Mr. George Stainton, who was Mr. Myers' chief competitor, was also appointed Second Assistant. These appointments give great satisfaction to the operators of the office.

Some of the "quad" men are ordered to skirmish around on way wires for an hour or two in the morning, and it is remarkable how attentive they are to calls on the Hudson River wires, while Jersey and New England may call till their hands are paralyzed.

It would be an injustice were not the thanks of the large number of men, assigned to duty at Elizabeth during the blockade, tendered Manager Barr for his successful efforts in making the New York operators comfortable in every way during their sojourn in Jersey.

Fred Cushing occupies a chair at the switch, and no one is more competent to fill it than he. Fred is an enthusiastic student of electricity, and in conjunction with Mr. Moreland, expects to introduce an invention that will be appreciated by any telegraph company.

*Frank Leslie's Weekly* contains some good pictures of the W. U. operating room. In reading the descriptive sketch which accompanies the cuts, one is led to imagine that the writer must have received his points from Jules Guthridge, when Jules was in one of his descriptive moods.

Mr. McInness was sent up to the cable house, at Thirty-fourth street, to test wires. He got hold of a wire with a weak battery. To settle the question as to whether it was dead or not, he "tasted" it just as a dynamo battery was put on. For several hours afterward his speech denoted the presence of hot pudding in his mouth.

During the recent storm Tommy Hynes, operator at Williams Bridge, established a reputation among New York operators as the prince of good fellows. When the delegation from 195 swept down upon him, he did not lose his head, but provided circuit after circuit, and personally arranged for the wants of the "inner man," and in every way endeavored to make the stay of his visitors as pleasant as possible.

Mr. Fred Hutchinson was selected by Prof. Gray to test the capacity of his latest invention, the Harmonic Quadruplex. The following remarkable averages were attained: Tuesday, Feb. 8, his average for five hours was a fraction less than 70 messages per hour, or a total of 347 messages. Wednesday, Feb. 9, for same number of hours, 75 1-5 messages per hour, or a total of 376. This is conceded, to be the best time on record. Mr. J. W. Walton, "Jw.," of Boston, was the receiver.

## PERSONALS.

Superintendent Holmes, of the Erie Railway, is confined to his home with a severe illness.

Mr. Andrew Scott, clerk and operator in Col. Wilson's room, Chicago, Ill., has been appointed manager at Cedar Rapids, Ia.

Mr. T. B. Reese has transferred his services from the Cairo & Vincennes Railroad, Grayville, Ill., to the P. D. & E. R.—same place.

A Western Union office has been opened in the Lincoln House, Boone, Iowa. Miss Mollie A. Fenton has been appointed manager.

D. P. Burnett, 38 years old, a well-known telegraph operator, committed suicide at Chicago,

on the 7th inst., by shooting himself through the head.

Mr. H. D. Pender, second son of Mr. John Pender, M. P., of telegraphic fame, is dead. He established the first telegraphic cable communication with the island of Cyprus.

T. T. Windsor, employed as clerk and operator at Newcastle, Pa., on the P. & L. E. R. R., has accepted a similar position in superintendent's office of P. & W. R. R., Allegheny, Pa.

The many friends of the Erie telegraphers will be pleased to learn that arrangements are going forward for the third annual reception, to be held at Paterson some time next month.

A telegram dated Paris, Tenn., says that on Feb. 10 John N. Edwards, telegraph operator at that place, fatally shot James Champion, who had made insulting proposals to his (Edwards') wife.

Mr. H. B. Spencer, chief operator in the Dominion Telegraph Company's office at Ottawa, has been appointed train dispatcher on the Canada Central Railway, in place of the late Duncan McQueen.

Mr. Charles M. Clark has resigned the management of the G. & S. C. telegraph line at Globe City, Arizona, and associated himself with Mr. W. H. Glover, formerly night chief San Francisco W. U. office, in the publication of the *Globe Chronicle*.

Mr. W. H. Owen, American Union manager at Middletown, N. Y., has accepted a position as train dispatcher on the C. & St. L. R. R., at St. Louis. He is well qualified to fill the new position, having previously held a similar one on the Midland R. R., at Jersey City.

Manager J. W. Stacy, of the Houston, Texas, W. U. office, was the recipient, on Wednesday, Feb. 2, of a handsome gold-headed cane, from the employees of his office, as an expression of the esteem in which he is held by his subordinates. On the cane is inscribed the "signs" of each of the operators. The presentation was made by Night Chief J. W. Brooks.

We have received from a reliable correspondent on the Erie Railway a protest against the growing evil of "students" on that road, in defiance of the prohibitory orders of Superintendent W. J. Holmes, and Division Operator W. J. Lipple. Our correspondent is prepared to furnish either of those popular and able officers with a list of the offending operators.

CHAMPAIGN, ILL.—The I. C. train dispatchers are Messrs. H. A. Ward days, and G. H. Galvin, nights. Mr. James Heit is I. B. & W. man, with Wharfle as owl. Mr. Myers has charge of the Wabash office. Mr. S. L. Nelson is Manager W. U. Mr. Rhodes has left us, to seek fame and fortune in the far West. Mr. James Morgan, night press man at Quincy, spent the holidays with his parents and many friends here.

C., ST. P., M. AND O. RY.—Miss Bessie Carroll has left the Merrillan Junction office, and accepted a position in the Winona City office. Her withdrawal from the road is much regretted. Mr. F. E. Blasen, for the past four years operator and agent at Valley Junction, has resigned and taken a position in the company's office at Hudson, Wis. Mr. W. S. Kemp, for many years conductor, has been appointed train master, and is located at St. Paul. Mr. O. T. Critchett, from "P. O." office, Chicago, has arrived at St. Paul.

PIQUA, OHIO.—The Western Union office, of which Mr. C. E. Machier is manager and operator, has eight wires. Fred Turk is the messenger. Mr. Machier if also manager of the Telephone. Messrs. Eddie Kitzmiller and Ed. Munger work the Exchange day and night respectively. The American Union office, presided over by Mr. George W. Morton, with Gust. Kuemmerling as messenger, has two wires. Mr. Theodore Sills is agent on the D. and M. road, with Messrs. James Lawder and Louis Graef operators, day and night. At the Pan Handle depot Mr. E. D. Baxter is agent; Mr. Ed. Yager, day operator and clerk, and Mr. Ash. Leonard, night operator.

The clerks and operators in the Portland (Me.) W. U. office recently presented the popular cashier, Mr. J. H. Wentworth, with an elegant Knights Templar charm and the following address: Mr. Wentworth, I desire that you *Malone* me your ears for a short time, and let what I say find a cell by itself and *Brickett* up that it

may have a perpetual resting place there. We have not requested your presence here to say that we hope you will *Livermore* useful life than heretofore. That *Wood* be unnecessary, as you have always occupied as useful a sphere as you would have had you been a *Saylor* and crossed the wide ocean, or a *Smith* with brawny arm, earning your daily bread by the sweat of your brow. It was not for this purpose we called you here, but for the far pleasanter one of wishing you a happy new year and expressing to you our kindly wishes in general.

TAUNTON, Mass.—The Western Union and Atlantic & Pacific companies are now represented here by nine different offices, in addition to the Telephone Exchange and Fire Alarm Telegraph. Mr. Charles W. Crandell has charge of the Western Union; he also has charge of the A. & P. office, assisted by Mr. John Q. Ryder. Mr. Arthur M. Waldron officiates at an important branch office at the Weir; Mr. Horace E. Crowell is back in his old quarters at X. y. office; R. Crocker at G; Frank Hudson at M u; James M. Briggs at D g, and L. C. Fuller at G c. Mr. Austin G. Ryder, with Mr. Charles A. Austin as assistant, is in charge of the Old Colony depot office at Wales street. This is an important repeating station. Two of the Phillips keys are in use here, and they are much admired. Mr. Charles E. Cummings is manager of the American Union.

FITCHBURG RAILROAD (main line).—At the Superintendent's office, Boston, Mr. W. A. Seward has charge of the train sheet, with Mr. F. J. Benthall, formerly of Concord Junction, as assistant. Miss Nellie Hayes remains at Fd. office. Mr. Geo. A. Prescott, for many years billing clerk at Sd. freight house, has been compelled to resign temporarily, on account of failing eyesight. He has been succeeded by Mr. M. D. Sullivan. A sketch of the offices along the line may interest the fraternity. At Charlestown we have Messrs. W. A. Sprague and E. B. Blake, day and night respectively; at Waltham, Miss Harding, Miss Englewood having accepted a position at 109 State Street, Boston; at Lincoln, Mr. Hutchins; at Shirley, Mr. Wilson; at Concord, Mr. H. H. Chapman, with Mrs. C. to assist him; at South Acton, Messrs. Haywood and William Hunt; at West Acton, Mr. Stevens; at Littleton, Misses Addie Patch and Emma Ireland; at Ayer Junction, a very busy point, Miss M. J. Bancroft; at North Leominster, Mr. G. P. Whidden, assisted by Miss Florence Barrett. Mr. W. F. Stevens, formerly agent and operator at this point, has been transferred to the general freight office, Boston. Mr. D. A. Rand, assisted by Mr. Gove and "Cn." is at Fitchburg. Mr. O. J. Fenton acts as circuit manager and general superintendent's chief clerk.

## BORN.

Jan. 31, 1881, to Mr. F. C. Lacey, operator W. U. Telegraph Office, Topeka, Kan., a son.

## MARRIED.

CREAMER—WALTER.—At Baltimore, Md., Nov. 9, 1880, by Rev. A. B. McKenzie, Mr. J. Marion Creamer, Manager of the American Union Telegraph Company at Petersburg, Va., to Miss Jennie Walter, of Baltimore.

VAN ORDEN—DREW.—In Brooklyn, N. Y., Jan. 26, 1881, W. A. Van Orden, of the Board of Trade telegraph office, this city, to Cecilia Drew, of Stamford, Conn. No cards.

## DIED.

BURNETT.—On the 7th inst., at Chicago, D. P. Burnett, aged 38 years.

BRADSTREET.—At Rochester, N. Y., Jan. 26, 1881, Edward G. Bradstreet, of the American Union office at Buffalo, aged 26 years.

BALLARD.—At Ottawa, Ill., Feb. 3, 1881, Lovira H., wife of C. L. Ballard, Manager Western Union Telegraph Company, aged 25 years.

LOGAN.—At Jersey City, Jan. 31, 1881, John F., aged 2 years and 8 months, son of James N. Logan, operator A. & P., 18 Broad street, New York city.

## All Persons Sending for

Catalogues or ordering articles advertised in our columns will do us and our Advertisers both a great favor by mentioning that they saw the advertisement in

"THE OPERATOR."

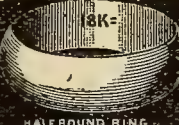

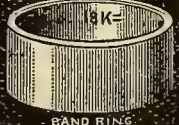

## ONE CENT

will buy a postal card on which to send your address and receive free by mail an eighty page book on "The Liver, its Diseases and their Treatment," including Malarial Troubles.

Address DR. SANFORD, 162 Broadway, New York.

## FREE FOR 4 MONTHS!

The Cricket on the Hearth is the largest, brightest, and prettiest \$1 publication in America. It is a 16-page, 64-column Illustrated Literary and Family paper (size of page 11 x 16 in.), and is filled with bright and sparkling Serial and Short Stories, Sketches, Poems, Puzzles, etc.—in fact, everything to delight and amuse the whole family circle. We want 50,000 new readers for our paper immediately, and in order to obtain them, and introduce it into every home in the Union where it is not already a regular visitor, we are now making the following extraordinary offer: On and after the appearance of this advertisement, we will send THE CRICKET ON THE HEARTH free for the next four months to every reader of this notice who will send us his or her name and address, plainly written, together with Twelve Cents, (in silver or postage stamps,) to pay the actual cost of postage on it for that time. This will include our splendid Holiday number, just issued, containing our Illustrated Premium List for 1881. Remember, we charge you nothing for the paper—we make it an absolute free gift for four months to any one who will write to us for it. Make up clubs! Send us a club of five 4-months' subscribers, and 60 cents for postage, and we will send you either a beautiful coin silver-plated Butter Knife or Sugar Spoon, of new and elegant pattern, as desired; or for ten subscribers, and \$1.20 for postage, we will send you both Knife and Spoon. Write at once. Do not miss this chance; it will not be repeated. Address, MOORE & WILSON, Publishers, 245 Broadway, New York.

**A ROLLED GOLD SOLID RING** makes a Beautiful and Valuable Gift for a Lady, Gentleman or Child, and in order to secure new customers for our firm we will forward post-paid, to any address in the United States, one of our **Heavy 18 K. Rolled Gold Rings** (either band or half round), on receipt of **75 Cents** in postage stamps, and if you wish we will engrave any name, initials, motto or sentiment desired, on the inside of the ring, provided you **Cut out this Advertisement** and mail to us with stamps before **June 30th, 1881**. At the same time we send your ring we will mail you a bundle of our catalogues and feel sure that you will be so highly pleased with the ring, and that it will give such satisfaction, that you will oblige us by distributing our catalogues among your friends. At the same time showing them the beautiful ring you have received from us. You can in this way assist us in selling other goods of standard quality, which are manufactured from new and original designs, and which we **Guarantee to give satisfaction**.

**Our Future Sales is Our Profit!** Remember, the ring we send you is **heavy 18 K. Rolled Gold**, and that this unprecedented offer is made only to introduce our goods and catalogues in your vicinity. Our firm is well established and reliable, manufacturing **first-class goods** from the **PRECIOUS METALS**.

We can only send out a **limited number** of rings at price named, and to protect ourselves from jewelers and dealers ordering in quantities, we will insert this advertisement but **one time** in this paper, hence require you to **cut it out** and send to us, so that we may know you are entitled to the benefit of this offer. Under no circumstances will we send more than one ring to any person sending us stamps and this advertisement; but after you receive this ring, and others are desired, we will furnish **18 K. Solid Gold Rings** at prices given in our illustrated catalogue, varying from **\$3.75 to \$9.00** each. To ascertain the size ring you wear, take a piece of paper and cut it so that it will just meet around the finger you wish to wear the ring on, send the slip to us and we will send a ring that will fit you. State which you want, the **Band or Half Round** ring, and what you wish engraved on the inside. **Cut this Advertisement Out and send to us, with stamps, before June 30th, 1881.** You can send stamps by mail at our risk. Address

**G. W. PETTIBONE & CO.,**  
25 Maiden Lane, New York.

THIS OFFER NOT GOOD AFTER JUNE 30TH 1881

ALL RINGS SENT ON DAY ORDER IS RECEIVED.

## THE DEAF HEAR

BY THE USE OF

### Peck's Patented Artificial Ear Drums.

Not observed in use, and comfortable to the ear. Cushioned, ventilated and harmless, and perform the office of the natural drums. The only perfected and patented Ear Drums. Also patented in Europe and Canada. Send for Treatise on the Ear; mailed free.

DR. J. P. PECK, Proprietor,  
No. 115 Nassau Street, New York.

## American Popular Dictionary

The following order is a sample of what we are receiving every day, and shows how the American Popular Dictionary "takes," both among Telegraphers and outsiders:

"Package of nine American Popular Dictionaries received and delivered. All seem well pleased with them. Please send me by Express same as before, ten more copies of the Dictionary and one copy 'Wired Love.'"

Yours respectfully,

Andover, O., Aug. 5th.

A. W. GATES.

Many of our readers could sell a large number of the Dictionaries if they only tried. Liberal discount to agents. Send \$1.00 for a sample copy, and see how many orders you can get.

To any one sending us \$3 for three copies, we shall send an extra copy free and postage pre paid.

W. J. JOHNSTON, Publisher,  
P. O. Box 3,332. No. 9 MURRAY STREET, N. Y.

## Scarf Pins and Bosom Pins, IN THE FORM OF Miniature Telephones.

These articles of jewelry are of the Best Workmanship in Gold, and aside from their distinctive merits as Emblematic of the Telephone Profession they are Unique and Elegant Ornaments.

TELEPHONE PIN (full size).

The above cut shows the Miniature Telephone, full size, fitted as a Badge or Bosom Pin. The Scarf Pins are fitted with long straight pins instead of the short clasp pins. We are now ready to supply this fine jewelry at the following extremely low prices:

	Solid Gold.	Rolled Gold.
Telephone Badge or Bosom Pin ....	\$5.00	\$2.00
Telephone Scarf Pin .....	5.00	2.00

Sent by mail post-paid and registered on receipt of price.

Address, W. J. Johnston,  
P. O. Box 3,332. No. 9 Murray Street, New York.

## GOODYEAR'S POCKET GYMNASIUM.

The Most Complete System  
OF PHYSICAL EXERCISE  
Ever Devised for Home Practice.

The following are a few of the advantages derived from the use of the Pocket Gymnasium: It calls into direct action all the muscles in the upper part of the body, and chiefly those which are generally neglected by persons of sedentary habits. It corrects the stooping posture so frequently noticed in young persons, and imparts a uniform degree of strength to the muscles supporting the spinal column. To those who are afflicted with dyspepsia, indigestion, nervous debility, weakness of the chest, lung and liver complaints, etc., it may be used with the most gratifying results. It is graduated to the use of the strongest man or the weakest child; is admirably adapted to the use of invalids and convalescents, where gentle exercise is desirable. To ladies and children especially, the exercise will be found of the most invigorating character. It is highly recommended by leading physicians and all those who have made the subject of physical exercise a study.

### PRICE LIST.

No. 1. For Children 4 to 6 years, \$1.00. No. 2. For Children 6 to 8, \$1.10. No. 3. For Children 8 to 10, \$1.20. No. 4. For Children 10 to 14, \$1.30. No. 5. For Ladies and Children 14 years and upward, \$1.40. No. 6. For Gentlemen of moderate strength, \$1.50. No. 7, \$2.00. Complete set of seven, \$9.00. No. 7 is fitted with a screw-eye and hook to attach to the wall or floor. Two of this size properly arranged make a Complete Gymnasium. JUST ADDED, No. 8 for gentlemen of extra strength, \$2.50. GOODYEAR'S HEALTH LIFE, complete, price \$5. Sent prepaid by express on receipt of price.

Address W. J. JOHNSTON,  
P. O. Box 3,332. No. 9 MURRAY STREET, N. Y.

## CONKLIN

## ELECTRIC RAILWAY SIGNAL.

To Railway Managers and Telegraph Superintendents:

We desire to call your attention to our Automatic Railway Signal, adapted to Blocks, Switches, Draw-Bridges and Crossings. We claim for our signal entire automatic action, and a simplicity in construction and operation which precludes the possibility of its getting out of order under any ordinary circumstances. The expense of its operation and maintenance is merely nominal.

We desire, also, to call your attention to our new Track Instrument, for which letters-patent have just been issued. These signals have been in use on the Manhattan Elevated roads since April, and have given entire satisfaction. The severe test of the elevated roads fully demonstrates their perfect reliability.

For circulars and full information address

## Conklin Electric Signal Co.,

145 BROADWAY, NEW YORK (ROOM 21).

## Leclanche Battery.

(PATENTED.)

"Prism" Battery "Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of  
**SIMPLICITY AND EFFICIENCY**

## In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

### ADOPTED AND USED BY THE

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and removed than any other battery. Beware of

### Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

# J. H. BUNNELL & CO.'S

## NEW STEEL LEVER SOLID TRUNNION KEY

PATENTED FEB. 15, 1881.

BEST IN THE WORLD.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for rapid and perfect Morse sending for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine wrought steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking is absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert or the beginner.

PRICE, \$3.00. FINELY FINISHED, AND LEVER NICKEL-PLATED.

LIBERAL DISCOUNT ON ORDERS FOR COMPANY SUPPLY.

Steel Lever Key sent by mail post paid, to any part of the U. S. or Canada on receipt of the above price, by registered letter or money order.

### THE AMERICAN UNION TELEGRAPH CO.

New York, Dec. 18th, 1880.

J. H. BUNNELL & Co.

Gentlemen:—We have in use in this office, sixty-eight of your Steel Lever Keys.

The general verdict regarding them is, that **THEY ARE THE BEST KEYS EVER PUT ON A DESK.**

Yours truly,

WM. J. DEALY,  
Manager Am. Union Co.'s (Main Office).

### UNION PACIFIC RAILWAY CO. (Telegraph Dep't).

Omaha, Neb., January 15th, 1881.

J. H. BUNNELL & Co.

Dear Sirs:—Your instruments meet with much favor on this company's lines and give good satisfaction. The Steel Lever Keys, especially, are much admired by the operators who generally pronounce them *the best*. They at once combine strength and neatness, and are well adapted for easy and rapid sending.

Yours truly,

L. H. KORTY,  
Chief Operator.

### CONTINENTAL TELEGRAPH CO.

New York, Dec. 14th, 1880.

J. H. BUNNELL & Co.

There is nothing that I can say that will be too strong in commendation of your New Steel Lever Key. Every one of our operators, without exception, regard it with decided favor, and I am now satisfied that its general use is not only a positive help to operators' efficient labors, but a decided advantage to the general service of the Company. We are using them in preference to all others.

Yours truly,

J. G. CASE,  
City Manager Continental Tel. Co.

### THE ATLANTIC AND PACIFIC TELEGRAPH CO.

New York, Dec. 16th, 1880.

J. H. BUNNELL & Co.

We have six of your Patent Steel Lever Keys in use here in the principal office of this Company. They give entire satisfaction in every way. We consider them a great improvement on the old style of telegraph key.

Yours truly,

P. P. HAUFF,  
Manager Main Office, 145 Broadway, N. Y.

### BALTIMORE AND OHIO RAILROAD CO. (Tel. Dep't).

Baltimore, Dec. 28th, 1880.

J. H. BUNNELL & Co.

Gentlemen:—I take pleasure in forwarding to you the accompanying testimonial, voluntarily contributed by the operators in Camden Station Office, to the superior merits of your New Steel Lever Key.

Very truly yours,

CHAS. A. TINKER, Supt.

### BALTIMORE AND OHIO RAILROAD COMPANY.

(Telegraph Department.)

December 27, 1880.

We, the undersigned operators at Camden Station, B. and O. R. R., Baltimore, having fully tested your "New Steel Lever Key," concur in saying, it is the *best*, without any exception, we have ever used.

Respectfully,

CHAS. P. ADAMS, GEO. R. BUNTING, JR.  
E. J. LITTLE, W. E. KING,  
J. W. FERRY, B. F. HARD,  
A. D. FEASEL, GEORGE BOGGS,  
W. W. MOORE, WM. A. LENZ,  
J. F. McLAUGHLIN, J. W. STAYLOR,  
H. P. BILSON.

And I endorse the above, C. W. CLARVOE, Div. Operator.

From the winner of first prize in the fast sending tournament, New York, August 22, 1880, 500 words in 11 min. 14½ seconds.

"Cable Station No. Sydney, C. B.," Dec. 26, 1880.

Prefer it to any other key I have ever used. It is the general opinion of the operators here that the Steel Lever Key is the best they have ever seen.

W. J. CURTIS.

"Your Steel Lever Key proves to be one of the best improvements ever introduced in Telegraphic Apparatus."

J. H. LOUNSBURY,

Manager Am. Union Telegraph, Hartford, Conn.

All our best senders who have tried it here, praise it highly and pronounce it "fast."

R. J. WYNNE,

W. U. Telegraph, Washington, D. C.

THE FOLLOWING EXPRESSIONS OF OPINION ARE ALL FROM THE WESTERN UNION MAIN OFFICE, 197 BROADWAY, NEW YORK.

We have your keys on the Chicago, St. Louis and Buffalo Quads, Western, Eastern and State Press, and C. N. D. Circuits. Without a single exception, the operators regard them as the very best.

FRED CATLIN.

Best key I ever used.

FRANK VITES.

Having worked your Key on Chicago Quad for the past month, can cheerfully say it is the best Telegraph Key I have ever used.

CHAS. F. HUTCHINSON.

Far superior to any other Key.

COURT M. CUNNINGHAM.

Requires less labor, is capable of greater speed, and sends finer and firmer Morse than any heretofore in use.

J. A. WRIGHT, JR., D. B. CASE,  
RICHMOND SMITH, E. F. HOWELL.

Consider your Key far superior to any I have yet handled.

J. E. SAYRES,  
Cincinnati Quad.

Like the Key very much. It makes sending easy.

T. H. ALLEN,  
New Orleans Duplex.

Your Key is, without doubt, the best in the world. It is simply perfection.

J. B. COULTER.

Our only desire is to have one of your Keys put on the Pittsburg Quad. Eitymiller works on the Pittsburg end.

DENNIS BROWN and M. DURIVAN.

Your Key is, in my opinion, unequalled.

MINOR M. DAVIS,  
Philadelphia Quad.

The finest in the world.

J. B. TALTAVAL, J. H. YOUNG,  
St. Louis Quad.

Best I have ever used.

E. H. MILLER,  
State Press.

Prefer it to any I have ever used.

CHAS. W. MINIER.

The best Telegraph Key we ever handled.

W. D. CHANDLER, } Chicago Quad.  
M. LABAUGH, }

There is but one perfect Key, and this is it.

W. C. ATKINSON,  
Baltimore Quad.

J. H. BUNNELL & CO., 112 Liberty Street, New York.

## UNION TELEGRAPH INSTRUCTION COMPANY.

Established 1875. Incorporated 1880.

Capital, \$5,000.

OFFICES:

No. 3 PARK ROW, NEW YORK.

No. 308 FULTON STREET, BROOKLYN.

This Company is specially designed and exclusively devoted to the purposes of teaching Telegraphy and qualifying young ladies and gentlemen for the work of branch city offices, Hotels, Summer Resorts, small country Commercial and Railroad Offices, Private Lines, etc.

Our instructors are all first-class night operators from the Direct Cable, American Union and Western Union offices, and also from the Elevated Railroads. Our facilities for Practical Instruction comprise over seventy sets of new telegraph instruments (forty sets being Bunnell & Co.'s New Steel Lever Keys and New Giant Sounders), Relays, Switches of every pattern, Paper Registers, 150 cells of battery, etc.

CITY LINE CIRCUITS with New York and Brooklyn connected, our operators and advanced pupils constantly transmitting messages for rapid practice.

WEEKLY LECTURES on all subjects pertaining to Electricity, Practical Telegraphy, etc.

Nearly every pupil has a private operating table, with all necessary instruments for his or her exclusive use.

Every circuit worked at a different rate of speed. Pupils are thoroughly drilled in correct rapid sending, forms of Messages, Checks, Tariffs, Office and Circuit Practice, Telegraphic Penmanship, etc., and are kept constantly employed for five hours daily under strictly enforced rules.

We have at present ninety pupils in attendance in both offices, many of whom are relatives and friends of operators and telegraph officials. We have references to nearly 100 pupils now employed as Operators, who obtained their entire practice with us.

OUR TERMS are Ten Dollars monthly. Time required, five to six months; five hours' daily practice.

Pupils who, after one or two months' trial, are found unsuited for the business, are requested to discontinue.

Certificates of proficiency only given to Competent, Careful and Reliable Pupils.

Correspondence invited from those learning in telegraph offices.

D. B. McEACHREN, Manager.

J. P. SMITHERS, Secretary.

## SPECIAL AGENTS' OUTFIT

We are anxious to secure a very large number of agents everywhere, both for THE OPERATOR and for the books we publish. Those in a position to act for us will oblige by making a beginning at once.

Should specimen copies be desired, drop us a postal card, and they will be immediately mailed you free.

Experience has demonstrated that the best selling books we publish are

TALES AND HISTORY,  
THE DICTIONARY  
AND WIRED LOVE.

That agents may be equipped for taking orders at an insignificant cost, we will send all three of these books, for use as samples, prepaid, on receipt of \$2.

Any of our other books at the same rate.

THE OPERATOR for fifteen months can be added to the above for one dollar extra.

### HOW SOME OF OUR BOOKS MAY BE SECURED FREE.

Although the subscription price of THE OPERATOR is so low that little margin for liberality remains, yet to any one sending us a club of four yearly subscriptions (old or new)—their own and three others will do—we will mail, free and postage prepaid, as a premium, a copy of either "Telegraphic Tales and Telegraphic History," the Dictionary, "Lightning Flashes," "Christmas Evergreens," or "General Grant," bound in cloth, or a copy of THE OPERATOR for one year.

Any two of these book for a club of eight yearly subscriptions; any four for fifteen yearly subscriptions; or the five for eighteen yearly subscriptions.

To any one sending us three yearly subscriptions as above, we will mail a copy of "Oakum Pickings," cloth, "Wired Love," cloth, or "Sam Johnson," paper.

To any one sending us two yearly subscriptions, as above, or their own and that of a friend, we will mail a copy of "Oakum Pickings," bound in strong paper, or a copy of "Telephone and Oshkosh."

All 9 Books for 25 Yearly Subscriptions.

A Silver Watch for 60 Yearly Subscriptions.

A Gold Watch for 160 Yearly Subscriptions.

Two half yearly or four three-months' subscription count same as one yearly subscription. Names can be sent in as fast as received, which will be placed to your credit, and can be added to at any time. Remit with each order. A cash commission, in lieu of premiums, will be allowed where such is preferred.

**W. J. JOHNSTON, Publisher,**  
No. 9 Murray St., New York.  
P. O. Box 332.

## THREE POPULAR BOOKS UNIFORM IN SIZE.

New Edition Just Published!

Uniform in Size with "Tales and History" and "Oakum Pickings."

## "WIRED LOVE;"

A ROMANCE OF DOTS AND DASHES.

BY ELLA CHEEVER THAYER.

The "Old, Old Story" in a New, New Way.

THE FIRST AND ONLY TELEGRAPHIC NOVEL, AND THE ONLY TELEGRAPHIC BOOK OF ANY KIND

WRITTEN BY A LADY.

256 PAGES. HANDSOMELY BOUND IN CLOTH. PRICE, 75 CENTS.

Having already issued the FOURTH EDITION of this admirable Telegraphic Love Story (which fact sufficiently demonstrates its popularity, both in and out of the profession), Mr. Johnston takes pleasure in recommending the book to telegraphers and others as a most entertaining, bright, sprightly and amusing work, either for summer or winter reading.

### OPINIONS OF THE PRESS ON "WIRED LOVE."

A good book to make you forget business and care, and leaves pleasant memories behind it.—*Chicago Inter-Ocean*.

A capital love story, the affection having its origin in telegraphic communications between two operators unknown to each other, fifty miles or so apart.—*Boston Commonwealth*.

The plot is well conceived and has several touches of originality in the handling. It is wide-awake, and will interest all who would like to read the old story told in a new way.—*New York Graphic*.

The book is written in an easy, off-hand style, pervaded with quiet humor, and its sentimental portions contain some suggestions of wisdom that are expressed with great force, beauty and originality.—*Boston Herald*.

A most original little book. We have had Cupid under all sorts of guises, with arrows barbed with all sorts of incongruous things, but never before have we had him using for a weapon the immortal invention of Morse.—*Boston Traveller*.

The love-making which goes on is done over the telegraph wires, and there is plenty of humor and a dash of mystery about the story which makes it refreshing reading. The heroine is a telegraphic operator, and the way in which her acquaintance over the wires with a fellow operator ripens into something more than friendship, is very pleasantly told.—*Boston Journal*.

A love story in which the chief personages are operators, and much of the conversation is by wire from station to station. The writer, Miss Ella Cheever Thayer, has shown

ingenuity in developing the situations of courtship under such circumstances, and made a bright, readable story, which will have peculiar attractions for the telegraphic fraternity, and, we must add, sisterhood.—*Boston Advertiser*.

The plot is original and the story written in an easy, humorous style that cannot fail to be appreciated. The adventures of poor Quimby, the hero of so many catastrophes, with his patient "I am used to it," will cause many a hearty laugh, and would alone made the book a success. Every one who wishes to read a bright, original book, and desires a good laugh, should buy "Wired Love."—*Boston Transcript*.

Making love by telegraph has perhaps not been infrequent since the general use of that wonderful invention; but for a young girl to fall in love with an operator without having seen him, merely from the way in which he sends messages, is something new. How that came about and what was the result of it, can be seen in a vivaciously written novel, "Wired Love," by Ella Cheever Thayer just issued.—*New York Mail*.

This romance of dots and dashes is a new departure, and most assuredly the best of the season in the way of light, or "vacation" literature. No reader but will hereafter have a little more respect for the ungainly telegraph poles which adorn our land; and the prosaic and common-place "sunder and key" will hereafter wear a veil of sentiment and romance. It is spicy and original; the interest is kept up throughout, and for the mission which it is meant to fulfill it is a most admirable work.—*Portland (Me.) Argus*.

Copies promptly mailed, prepaid, on receipt of price, 75 cents. Postage stamps taken.

"Wired Love" and "Tales and History," together, postage prepaid, \$1.50. "Wired Love" and THE OPERATOR, one year, \$1.50. "Wired Love," "Sam Johnson," and "Tales and History," \$2.00. "Wired Love," "Sam Johnson," and THE OPERATOR, one year, \$2.00. Any of our other \$1 books, in lieu of "Tales and History" or THE OPERATOR one year, at the same price.

A copy of "WIRED LOVE" will be mailed free and postage prepaid to any one sending us a club of three yearly subscribers to THE OPERATOR. Their own and two others will do.

New Edition Just Published!

Uniform in Size with "Tales and History" and "Wired Love."

## OAKUM PICKINGS:

A Miscellaneous Collection of Stories, Sketches, Essays, and Paragraphs, Telegraphic and General, By Walter P. Phillips, "John Oakum," with a fine Steel Plate Portrait of the Author.

Fourth Edition, 188 pp.; Medium 12mo; Paper, 50c.; Cloth, 75c.

The welcome accorded this, the first book ever published with the object of giving the telegraph profession a literature of its own, has been general and hearty, on the part of both telegraphers, press, and general reading public in all parts of the country. Mr. Phillips, the author, is well known to the fraternity as a spicy, original, witty, entertaining, and popular contributor to telegraphic and humorous literature, and his character sketches of "Jim Lawless," "Tip McClosky," "Posie Van Dusen," "Cap. De Costa," etc.—all of which are contained in Oakum Pickings—have won for him an enviable reputation as a humorous sketch writer.

What the Newspaper Press has to say of "Oakum Pickings":

Highly amusing.—*N. Y. Times*.

Bright, witty, and full of humor.—*Publishers' Weekly*.

Short, realistic, lively sketches, illustrative of his own profession.—*N. Y. Tribune*.

There is not a dull page in the work.—*Telegrapher*.

If you can read the book without saying, "John, go and

do so some more," you are less susceptible to what is good than we are. Try it, and see.—*Elmira Advertiser*.

The best fancies of a fertile brain, smooth in style, and epigrammatic, but not flashy. There is in them all a quiet undercurrent of quaint dryness, that is irresistibly attractive.—*American Bookseller*

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, on receipt of.....\$2.00  
The three books and THE OPERATOR one year, or any \$1 book..... 2.75  
The three books, THE OPERATOR one year and "Sam Johnson" (cloth), or any \$1 book.... 3.50

# AN IMMEDIATE AND IMMENSE SUCCESS!

## Telegraphic Tales AND Telegraphic History

A POPULAR ACCOUNT OF

## THE ELECTRIC TELEGRAPH---ITS USES, EXTENT AND OUTGROWTHS.

By W. J. JOHNSTON, Editor of "The Operator."

Handsomely Printed on Tinted Paper and elegantly bound in cloth and gilt.  
254 pages. Price only \$1.

The remarkable favor with which this our latest publication has been received, both by

TELEGRAPHERS, PRESS AND THE GENERAL READING PUBLIC,

will be seen from the following extracts, selected from a large number of complimentary letters received since the book was published.

Those given without signatures are from telegraph or telephone officials, managers, operators and others from whom we had not received (or asked) permission to use their names. Where names are given permission has been obtained.

"Neatly gotten up, tasty and full of fun."  
"After a day's toil, to pick up such a book is a pleasure and relief."

"An excellent book, and contains many interesting reminiscences."

"It is unquestionably one of the prettiest books of the year for the money."

"It is very cheap, and should have a place in every telegrapher's library."

"It is most interesting and readable, covering the entire field of electrical inventions down to the present date."

"I consider 'Telegraphic Tales' the best of your publications, and shall take great delight in recommending it among my friends."

"You will know my opinion of the book when I tell you that I glanced at it to see what it was like, and did not stop till I read every word in it."

"A book that one can keep as a thing to refer to in case of a question in telegraphy coming up, and one that every telegrapher at least should have."

"Extremely interesting. Keep on, and at some future day your adopted sign may be as well known to the public as that of any of our greatest publishers."

"During sixteen years' connection with the telegraph nothing I have read has proved so entertaining. I shall certainly recommend it to friends and acquaintances."

"All well-posted operators know how much you have honored them as a profession heretofore, first in the publication and continuance of so fine a journal as THE OPERATOR, and afterward by publishing many splendid books. In publishing 'Tales and History' you have added another claim for our reverence, respect and hearty support. It is a most interesting work. No operator who has pride of profession in his heart can afford to be without it. The chapters detailing the scenes at the War Department on receipt of the telegram to Lincoln and Stanton, announcing the fall of Richmond, is alone worth more than the price of the book, while the history of the part that operators took in the war will be read by all with deepest interest. Let all 'toilers at the key' send for it at once."

"'Tales and History' is one of the best books I have ever read."  
R. FERGUSON.

"A. U., BROOKLYN, N. Y."

"Am very much pleased with it. Every one pronounces it a gem."  
CARL M. FOUST.

"ASHTABULA HARBOR, O."

"Instructive and entertaining, and without any doubt worth twice the money asked for it."  
A. MATHEWS.

"W. U., PORTLAND, Me."

"Externally the book is a beauty, and its contents are equally as attractive. It is a mystery how you can offer it so cheap."  
C. H. NEWMAN.

"A. U., BINGHAMTON, N. Y."

"I have found it so very interesting that I neglected

sleep to finish it. I would recommend it to every operator in the land."  
F. T. LILLOTTE.

"PINCONNING, Mich."

"I think it is a beauty outside, and the inside contains very valuable and interesting reading. Every one, whether an operator or not, should have a copy of 'Tales and History.'"  
CHAS. H. SUTHERLAND.

"CARLTON, Mich."

"'Tales and History' received. Am delighted with it. Besides being interesting, it is an ornament to any table. Every telegrapher's table should have one. Shall try and have my friends send for a copy."  
FRANK B. GRAY.

"W. U., SALEM, Mass."

"Handsomely printed and elegantly bound. It contains a great deal that is instructive to the operator, and at the same time very entertaining. It far exceeds my expectation, and merits all that is claimed for it."  
C. HELMS.

"A. U., JESSUPS, Md."

"It presents a very fine appearance, being in a neat binding, and its contents cannot fail to interest any telegrapher. The information it contains is worth twice its cost. It will ornament the shelves of any library. Every operator should have a copy."  
E. S. LAUREE.

"B. & A. R. R., ENFIELD, Mass."

Being printed from new type, purchased especially for this book, on handsome tinted paper, elaborately bound in gilt and black, "Tales and History" makes a most appropriate holiday present at a very low price.

### PRESS NOTICES OF "TALES AND HISTORY."

#### WHOLE HISTORY OF THE TELEGRAPH.

"This quite interesting volume, the work of the editor of THE OPERATOR, gives the whole history of the telegraph in a brief and intelligent manner. The topic chosen by the author is a most interesting one, and by his thorough familiarity with the subject, theoretically and practically, he has succeeded in making not only a useful but a most amusing volume."—*New York Times*.

#### COVERS THE ENTIRE FIELD.

"Judging from the cursory examination we have been able to give the above book, it promises to eclipse in interest any of Mr. Johnston's other works. The new book very thoroughly covers the entire field of telegraphic literature. The crude methods of signalling in use among the ancients; the invention, perfection and introduction of the electric telegraph; the telegraph in war; cable telegraphs, railroad telegraphy and train dispatching; weather reports; the most recent applications of electricity; the telephone; electric light; electric railways; the photophone; telegraph operators and messengers; humors of the telegraph; telegraphic 'bulls'; swindling by telegraph, are among the matters treated of. The book deserves a liberal sale both among telegraphers and outsiders."—*Journal of the Telegraph*.

#### AS UNIVERSAL IN ITS METHODS AS THE TELEGRAPH ITSELF.

"The scope and value of the pretty volume bearing this title are best indicated by a general statement of its contents. A chapter on pre-electric telegraphs is followed by an account of the invention and of its introduction into this country. Then follow a talk about operators and messengers, and a chapter on the use of the telegraph in war, in which prominence is given to the war of the rebellion. Cable telegraphs and the Atlantic cable—a valuable contribution to history—is succeeded by humorous stories and 'bulls.' Next the freaks of the lightning find place, succeeded pleasantly by an account of abuses wrought by the employment of lightning as a messenger. Weather reports, railroad telegraphy and new and curious uses of the electric fluid, with a whole chapter on 'Electricity and Life,' and another on 'Outgrowths of the Telegraph' complete an outline survey of the work, which seems to be as universal in its method as the telegraph itself in its presence throughout the world. The author, W. J. Johnston, labored in its preparation, as he states in the graceful preface to his book, 'in the hope and belief that it will occupy an unique place among those books which instruct without being tedious and entertain wholesomely.' We think that it will, without question, especially as it has been brought out in such excellent style—in dove-colored cloth, suitably adorned in black and gold. 'Telegraphic Tales and Telegraphic History' is admirable as a gift book."—*Geyer's Stationer*.

THE

**American Bell Telephone Co.**

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander  
Graham Bell for the Electric Speaking Telephone, and  
other patents covering improvements upon the same, and  
controlling, except for certain limited territory, under an  
arrangement with the Western Union Telegraph Company,  
the Gold and Stock Telegraph Company, the American  
Speaking Telephone Company, and the Harmonic Tele-  
graph Company, the patents owned by those companies, is  
now prepared to furnish, upon application, either directly,  
or through any of its agents, Telephones of different styles,  
and applicable to a variety of uses.

This Company desire to arrange with persons of responsi-  
bility for establishing

**DISTRICT OR EXCHANGE SYSTEMS,**

in all unoccupied territory, similar to those now in opera-  
tion in all the principal cities in this country.

Responsible and energetic persons are required to act as  
agents, for the purpose of establishing

**PRIVATE LINE**

AND

**CLUB LINE**

systems, for business or social uses. Also to introduce the  
telephone for

**SPEAKING TUBE**

purposes, for which instruments will be leased for a term  
of years at a nominal rental.

This Company will arrange for telephone lines between  
cities and towns where Exchange systems already exist, in  
order to afford facilities for personal communication be-  
tween subscribers or customers of such systems.

We respectfully invite attention to this matter, and any  
further information relating thereto can be obtained from  
the Company, No. 95 Milk street, Boston, Mass.

All persons using Telephones, not licensed by this Com-  
pany, are hereby respectfully notified that they are liable  
to prosecution, and for damages for infringement, and will  
be prosecuted accordingly to the full extent of the law.

THE BISHOP  
GUTTA-PERCHA WORKS,  
Original and only Manufacturers in the U. S. of  
PURE GUTTA-PERCHA GOODS,  
422, 424, 426  
EAST TWENTY-FIFTH ST., N. Y.

ESTABLISHED IN 1847.

S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description. Under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA or Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds.

Submarine Telegraph Cables, 50 varieties, one to ten conductors.

Submarine Telegraph Canal Cables—any number of conductors.

Aerial and Underground Cables of all styles. Hemp armor covered.

Lead-Covered Telegraph Cables, one to seven conductors.

Office Cables, one to seventy-five conductors, gutta-percha and cotton-covered.

G. P. Insulated Wire of all sizes.

Fuse. Leading and Connecting Wires for submarine and mining purposes.

Marks' Compound Office Wires, various sizes, for office, underground, and outdoor use.

G. P. Office Wire, cotton-covered.

Flexible Elevator Cables, any number conductors desired, of every style, and for all purposes.

Compressed Electric Cotton and Linen Double and Triple Covered Cordage any style or pattern.

Burglar Alarm, Call Bell and Annunciator Wires double cotton wrapped and saturated with any preparation.

Magnet Wires, copper and German-silver, cotton, silk and fibre covered.

Copper Wires, specially covered for electrical lightning purposes.

Telephone Flexible Cords and Magnet Wires, finest and best manufactured.

Agents for Reception of Orders and Sale of Goods:

### AN OPERATOR'S MUSINGS.

Often sitting at my table,  
In my office, warm and bright,  
Listening, as across the wire  
Flies the chatter, gay and light,

Have I thought how very happy  
Is the young and blithesome heart,  
Never heeding all the sorrow  
That the dash and dot impart.

Oh, how lightly we are writing  
Words that cause the teardrops flow;  
Seldom ever does their sorrow  
Cause our hearts with sadness glow.

Pity? Aye, perhaps a moment's  
Pity may but fill our mind,  
Then forget—a sudden sunshine  
In bright words of joy we find.

Death! Why need we heed its terrors,  
While all else is bright around,  
When such keen and lively pleasure  
In the ticking noise is found?

Aye, perhaps the clash and clatter  
May but tell us all too soon,  
Sorrow that may wring our heartstrings,  
Of a comrade's early doom.

So, why need we borrow trouble?  
Let thy noisy music make  
Life as bright and gay and cheerful—  
From the present sadness take.

### The Telegraph Agreement—The Cable Companies Kicking Back.

According to the agreement of Jan. 19, the consolidation was consummated on Feb. 19 by the delivery of the \$80,000,000 of stock, and finally, on the 24th ult., by the virtual transfer of the property of the American Union and Atlantic & Pacific to the Western Union.

At a meeting of the Western Union Telegraph Company, held in this city, Feb. 19, 325,973 shares voted in favor of the increase of the stock to 800,000 shares of \$100 each and 100 against the increase. The one hundred shares which were voted against the increase belong to Mr. William S. Williams, who had already, as reported in the last issue of THE OPERATOR, brought one of the suits against consolidation. Jay Gould, William H. Vanderbilt and Governor Cornell were present at the meeting. Most of the shares were voted by proxy. On the same day the certificate of the increase of the capital stock of the Western Union Telegraph Company to \$80,000,000 was filed at Albany, N. Y., with the Secretary of State, the messenger

bearing the certificate traveling by special train.

Meanwhile, the case has been pending in the law courts. On the 17th ult., in the Superior Court, the motion of W. S. Williams vs. the Western Union Telegraph Company and the Union Trust Company was argued. In this case the question involved is different in many respects from the point at issue in the recent action which was brought in behalf of Mr. Rufus Hatch, to prevent the consolidation of the companies. In Mr. Hatch's case the point to be settled was the legality or illegality of the amalgamation under the laws of the State of New York as affecting the rights of stockholders in corporations. In the action brought by Mr. Williams an issue in law and equity was brought up. It is claimed by the last mentioned gentleman that the managers of the Western Union Telegraph Company are doing him a great injustice by making a bargain to give certificates of the stock of their company amounting to \$15,000,000 for only \$5,000,000, which is represented by the American Union franchise. Mr. Williams says that he being a Western Union stockholder, the consummation of such a bargain as that above mentioned is nothing more nor less than taking money out of his pocket without his consent. The Chief Justice reserved his decision, but gave his assent to the prospective meeting of the Western Union stockholders, called for that day.

Mr. Williams had based his suit simply upon hearsay and circumstantial evidence, and not upon his own knowledge and belief. To remedy this defect in his complaint he obtained, in the Superior Court, an order for the examination of the defendants, with a view, practically, of making them testify against themselves. The persons to be examined were Dr. Norvin Green, President of the Western Union, and the Directors of that company—Messrs. Edwin D. Morgan, William H. Vanderbilt, John Van Horn, Cornelius Vanderbilt, Moses Taylor, Wilson G. Hunt, Darius O. Mills, Anson Stager, Jay Gould, Russel Sage and Thomas T. Eckert. Mr. Edward King, President of the Union Trust Company, was also directed to appear for examination. In response to this order of the Superior Court, Messrs. Jay Gould, Russell Sage and others appeared on the 23d ult., but before the proposed cross-questioning was commenced, their counsel moved to vacate the order for their examination, on the ground that Mr. W. S. Williams was confederated with Rufus Hatch, the Direct Cable Company and the French Cable Company,

in instituting suits in the courts for the purpose of injuring the stockholders of the Western Union Telegraph Company, and depreciating the market price of the stock. Under these suits the directors of the Western Union were required to be in two places at the same time. They were asked to attend an examination to the injury of their business. The object was to unnecessarily harass them. They were asked to appear, under the false allegation that they were conspirators, for the purpose of trying to obtain information from them to convict them of conspiracy. After an exhaustive argument Chief Justice Sedgwick announced that he would reserve his decision on the motion to vacate the order of examination, and so the Williams suit ended for the time being.

On Feb. 16 the Direct United States Cable Company filed a bill of complaint in the United States Circuit Court against the Atlantic & Pacific, the Western Union and the American Union Telegraph Companies and the Union Trust Company, praying for a perpetual injunction against the defendants to restrain them from any acts to carry into effect the agreement of consolidation entered into by the defendant telegraph companies on the 19th of January, 1881. It was sought to restrain the Union Trust Company from receiving or delivering any shares of telegraph stock in pursuance of this agreement. The case was further argued on the following day, when Judge Blatchford said there were complicated interests in the case and it was not quite clear what the counsel desired. After further general talk with counsel he granted a restraining order, applying solely to the property of the Atlantic & Pacific Company, and, while not interfering with the action of the Western Union stockholders, enjoining the proposed action as a result of that meeting so far as the transfer of stock for Atlantic & Pacific stock was concerned, and restraining the Union Trust Company from delivering Western Union stock to stockholders of the Atlantic & Pacific at present. The motion to make the restraining order permanent was then set down to be argued on the 24th ult.

On that date several amendments to the bill of complaint were read, among them an agreement dated Dec. 18, 1880, in which Mr. Jay Gould made a contract for the construction of two submarine cables, to connect North America with Europe, for \$6,000,000; also an agreement of the same date by the American Union Telegraph Company with Mr. Jay Gould and his associates, by which all cable messages received by that

company shall be sent by the cable route of Mr. Gould and his associates.

After argument by counsel, the further hearing of the case was postponed until Saturday, Feb. 26, at ten o'clock. Judge Blatchford, however, expressed the opinion that the Western Union company has the same right under the law to maintain and operate its lines as they are to-day, after this transfer has taken place, as it had before the 19th of January, and that the United States has nothing to do with the consolidation of the stock of the companies.

Argument was resumed on the 26th, and several additional affidavits put in evidence. Judge Blatchford said that he didn't see that the parties to the suit were apart at all on what is really the substantial matter in the case; but if the plaintiff insists on an injunction against the completion of the agreement of Jan. 19, 1881, that is another thing. The case was then postponed until Monday, 28th ult.

The action of the Direct Cable Company, in filing a complaint against the consolidation, was promptly followed by similar action on the part of the "French Cable Company." On the 19th of February this company filed in the United States Court, in this city, a bill to prevent the carrying out of some of the provisions of the articles of consolidation. In this case Judge Blatchford granted a temporary injunction until the 24th ult. On that day the case was not called, and it will most likely remain in abeyance until the case of the Direct Cable Co. is settled.

In both of the latter cases it is evident that the cable companies feel no solicitude for the interests of the general public, since they have themselves consolidated within the past year. Their anxiety is mainly on this account: The old Western Union had an exclusive contract for the interchange of business with the Anglo-American Cable Company; the Atlantic & Pacific a similar contract with the Direct United States Cable Company, and the American Union had a contract with the new French Cable Company. The contracts were made for a long term of years and for the exclusive exchange of business by the respective companies. If it were possible for the new Western Union Company to fulfill the provisions of these separate and antagonistic contracts the equitable division of the business between the cable companies would be extremely difficult. The cable companies, to be sure, have what they call a working arrangement for the division of business under their existing contracts with the land companies, but this pooling arrangement did not contemplate the union of the telegraph companies. This state of affairs would appear to be sufficiently complicated, but the interests of the several companies might possibly be adjusted harmoniously if even this was the worst. But the present cable companies evidently apprehend danger from the new American cable company recently organized, and they foresee in this movement on the part of Americans great competition and bitter hostility to interests which at present belong exclusively to the English. It has simply become a struggle for existence between these English cable companies for a share in the rich spoils of American telegraphy, with the great nightmare of two new American cables confronting them. As a matter of fact, without the new American cables no injury could be done to the existing cable companies by the consolidation. For instance, the Atlantic and Pacific stock has been held by the Western Union, and the two home companies have worked together with the utmost harmony for years, without complaint from the Direct Cable Company. Moreover, if the business of the consolidated land lines should be entirely diverted from the Direct cable, it would not injure the profits of that company in the least, since under the terms of the recent cable consolidation, if it should not carry a message it would continue to receive its pro rata of the receipts from all cable business for thirty years, while its contract with the Atlantic & Pacific has only twelve years to run. The same argument will apply to the case of the French Cable Company, with which the American Union has a contract. They all fear, not the land line consolidation, but the new American cables.

The new company—the Merchants' Telegraph

Company—appears to be thoroughly in earnest and is going ahead nicely, but with its small capital (\$300,000) it does not inspire much enthusiasm outside of the brokers, the general impression being prevalent that when it becomes important enough to be worth buying up or crushing out, the monopoly will promptly put up the necessary \$300,000 to buy it up or put down the rates so low as to crush it out.

The legislators have been less active in their wild opposition to the consolidation. Since our last issue the Illinois Senate has passed a bill to tax telegraph companies two per cent. on their gross earnings. In the Pennsylvania Senate, on the 23d ult., Mr. Keeffer introduced a bill prohibiting any person from offering for sale any stocks, unless he or she shall be the actual owner of the same or attorney for the owner. On the same day and in the same body Mr. Smith introduced a measure preventing telegraph companies from consolidating, and declaring any such consolidation since Jan. 1, 1874, to be invalid. As the last-named bill is in the nature of an *ex post facto* law, which is forbidden by the Constitution of the United States, its fate will doubtless be a hard one when some one explains that fact to the Pennsylvania Senate.

At Albany, N. Y., a resolution passed the House on the 17th ult., and the Senate on the 23d ult., its preamble setting forth the proposed increase of Western Union capital to \$80,000,000. The resolution is as follows:

*Resolved*, That the Attorney-General of this State be and is hereby directed forthwith to implead the said corporation in an appropriate action in the Supreme Court in the nature of a writ of *quo warranto* to the end that if the law does not permit such watering of the capital stock of corporations by fictitious issues of paper scrip, judgment to that end shall be had and the like evil prevented.

On the 23d ult. a resolution was passed in the Ohio House of Representatives directing the Attorney General to proceed by *quo warranto* against any telegraph company or companies that may proceed to perfect consolidation or amalgamation, in violation of the act of the present month, which places the telegraph companies under the same restrictions as to consolidation as those governing railroad corporations, and which has prevented the consolidation of railroads running on parallel lines.

The postal telegraph scheme has been heard from once since our last issue. At the regular monthly meeting, in this city, of the Board of Trade and Transportation, a report was made which concluded as follows: "We are also of the opinion that all the States should at once take such action as they can by limiting charges, and in every other constitutional way to counteract the effect of the recent consolidation, and also to revise their laws (wherever possible by constitutional amendment), and embody therein the best features of the laws of Massachusetts and the new Constitution of Pennsylvania relating to consolidations, stock-watering and other corporate abuses." Resolutions were then adopted, urging the present Congress to take all necessary action to secure information regarding the workings of the postal telegraph in Great Britain, in order that it may be adopted in the United States without unnecessary delay.

A pamphlet has appeared in this State in answer to the argument of Dr. Green, used before the select committee at Albany, in which he took the ground that the Western Union had the right "to increase its capital stock," as proposed, under the articles of association of the old Mississippi Telegraph Company, which afterwards became the Western Union. Like all the other pamphlets which invariably appear in times of excitement, this one has had about as much effect on the consolidation as pouring so much water on a duck's back would have on the duck. They rather seem to like it.

It is stated in some quarters that the railroad war between the B. and O.; P., W. & Baltimore and the Pennsylvania Railroad is an outgrowth of the recent telegraph war. It will be remembered that some time ago the American Union agreed to pay the Pennsylvania Railroad \$100,000 a year for privileges on that road then enjoyed by the Western Union. With the consolidation of the telegraph companies Mr. Gould changed his mind, after treating with the Pennsylvania to be allowed to abrogate the contract made between that company and the American Union. It will

be recollected that proceedings in the suit in this matter were temporarily suspended a few weeks ago, in the hope that a compromise could be effected. The Pennsylvania refused to yield, and now it is authoritatively stated that Mr. Gould threatens to cut that company off from Washington.

But the most striking and effective opposition to the new Western Union was manifested on the 21st ult., at a meeting of "The Anti-Monopoly League," at Cooper Institute, in this city. Mr. L. E. Chittenden presided, and there were also present Mr. Peter Cooper; Gov. Reagan, of Texas; Judge Jere S. Black and other distinguished citizens. A bitter antipathy to monopolies of all kinds was manifested in the speeches, but in a manner sometimes more lusty than judicious, and it was evident that, whatever the character of the speakers are, they were catering to a decidedly Granger element. It is unfortunate that such remarks as "Cut his throat" should have been interjected into the speeches; that the name of President-elect Garfield should have been hissed, and that the local poet should have been permitted to beguile the glee club present into singing "The Anti-Monopoly Song," to the tune of "John Brown," and of which the following are two specimen bricks:

For Vanderbilt and Company 'tis indeed a gilded age,  
But poverty increases and 'tis thus that tramps are made;

Shall it, will it, be continued when the people's votes  
are weighed? As we go marching on.

No! we'll hang Jay Gould (in effigy) on a sour apple  
tree,

And bring to grief the plotters of a base monopoly;  
From the heartless ghoul's of booty we've determined  
to be free. As we go marching on.

Many of the speeches were quite consistent with the singing, but all were, at least, evidently honest, earnest and sincere, even if in danger of occasionally dropping into Kearneyism. Finally, a series of resolutions were adopted which, if they were incorporated into the law of the land, could be construed to mean almost anything in the nature of confiscation; and they would be apt moreover to stagnate trade and enterprise and put an end to the judicious investment of capital.

Working operators, who understand thoroughly that cheap—too cheap—rates mean low salaries to the employes, can have little concern with these leagues, beyond the general hope that the company will be wise and firm enough not to yield to any wild clamor for sweeping reductions, either in rates or salaries.

The presence at this meeting of such a great number of eminently respectable and influential characters shows that much feeling has been aroused; though, as we believe, unnecessarily. The "monopolists" are not the men to forget these facts, and will profit by them; so that we look for a judicious policy, which will be honorable and just alike to all—the public and the employes.

#### Directions for Building a Short Telegraph Line.

BY T. D. LOCKWOOD.

"J. H. M." wants "explicit directions for putting up a short line for two offices, running only one wire, grounding at each end," and also desires to know whether "it can be done without switchboard and relays?"

We take the opportunity offered, with the letter of our correspondent as a test, to give general directions for the cheap construction of a private line.

As our correspondent is a Morse operator, it is but fair to assume that the line he has in view is to be a Morse line; and a Morse line, accordingly will be the one we shall speak of.

Three essential elements are requisite in the simplest line of telegraph, namely: The apparatus for generating or developing the electricity; the line or conductor, whereby the electricity is transferred from one point to another and communication established; and the transmitting and receiving apparatus, by which the electrical messenger makes itself apparent and forwards and interprets its language.

Although there are many ways of generating electricity, for the purpose in hand the simplest apparatus is a galvanic battery. The usual arrangement in this country being to keep the battery on closed circuit, it is necessary to choose one that does not soon exhaust itself when its circuit is closed. It is also well to adopt one that is economical in maintenance, and that does not need much attention.

Such a one may be made as follows: Take as many glass jars as are necessary, in size six inches wide by eight deep. Take also a corresponding number of round flat plates or sheets of copper, that will easily go in and lie on the bottom of the glass jars. Then cut a number of pieces of gutta percha covered or kerite copper wire. Bare one end of each piece for about an inch and rivet (not solder) it into a couple of holes previously drilled in the copper plates near the edge. The wire must now be extended up the side of the jar, to make connection with the next zinc.

All the coppers, being placed inside and at the bottom of the glass jars, are now covered with sulphate of copper (blue vitriol), crushed to about the size of a small filbert. The layer of copper sulphate may be three inches deep, and is to be covered first with a piece of cloth or blotting paper, cut to fit the jar; the blotting paper must then be covered with a layer of fine sawdust, packed down rather firm—while on the top of the sawdust is placed the plate of zinc. The cell may then be filled up with water, and when put in operation the cells used are connected in series, the zinc of one being connected to the copper of the next, and so on. The battery, when first set up, will not produce much current, and so should be set up several days before it is required, and placed on short circuit—each cell connected to the next—and a copper wire then connected from the zinc at one end to the copper at the other.

The conducting medium is next to be considered. For long lines numbers 8 or 9 galvanized iron wire is generally used, strung on large glass insulators; but for a short private line, numbers 12 or 14 is sufficiently large. This may be bound with tie wires to what are called pony insulators.

For the transmitting and receiving instruments, a key and sounder are all that are necessary at each station.

Having thus stated what is necessary to construct the line, we will now describe the method in which the several elements are put together.

The line may be, for example, a mile long, with a station at each end. It is not necessary to erect poles at every point where the wires are to be supported; although when this is done the line is more exclusively under the control of the builder at all times.

The poles necessary to carry one wire need not be more than twenty-five feet long. They should be planted not less than three and a half feet deep, and must not be less than three inches in diameter at the top. At road crossings the poles must be sufficiently high to clear anything liable to pass under.

The line wire is supported on glass insulators which are screwed on to wooden brackets, which in their turn are spiked to the side of the pole, near the top. If poles are not used, the ridge-poles of houses or barns can frequently be utilized, the insulator being in that case fastened on what is called a ridgepole iron. Irons can also be fastened on the corners of chimneys for the reception of insulators. After the supports are all in place, the wire, which for such a line should not be larger than No. 12, may be strung. It may be pulled up very tight if the work be done in cold weather, and reasonably tight in any case. After the line wire is strung, it should be brought down to a window at each of the terminal stations, and there terminated by winding the end of the wire back on itself. A hole must then be bored through the window frame and a rubber covered wire passed through. About six inches of the outside end must be stripped and carefully scraped until clean and bright. The iron line wire must also be scraped or filed bright for about four inches on the outside of the last insulator, which we suppose is just above the window, and the end of the covered wire is tightly and closely bound round the scraped portion of the iron wire. The joint should then be soldered—indeed, every joint ought to be soldered.

The end of the rubber-covered wire which is inside of the window is also stripped, and is spliced carefully to a piece of office wire, preferably No. 18, covered with braided cotton. This wire is either tacked down with double-pointed tacks, to the window frames or partitions and walls, until it reaches the instrument table, or strung on porcelain picture knobs. The latter plan is the best for plaster walls, and, indeed, in nearly every case, as it gives a choice of route, enabling the constructor to take the ceiling if he desires. On arriving at the instrument table the wire should be carried down behind it and brought up through holes in the table, which we shall hereafter designate.

In choosing a table for the instruments, it is best to take an ordinary table or desk of unpainted wood. A table covered with green painted cloth or enameled cloth should be avoided, or, if used, a place should be cut out for the key so the key does not touch the painted surface at any point. Such a table, when left as it is and the key placed over the enameled surface, often causes an escape which, if unsuspected, is hard to find.

The table need not be large. The sounder should be placed at the left hand side, and the key at the right, so as to be readily accessible to the right hand of the operator. The instruments should also be placed at the inner side of the table, in order that the operator's arm may obtain a rest while sending.

After the sounder is placed in the required position, it is screwed down, both to retain it in position and to give a solid sound; and a hole is bored through the table at each end of the sounder binding posts. Larger holes are bored for the legs of the key, which is then placed in its proper position and also screwed down.

The office wire attached, the kerite is led under the table, and brought up through one of the holes opposite the sounder; the covering stripped off and the end doubled on itself and inserted in one of the sounder binding posts. A short wire, also covered, is led from the other sounder binding post to one of the legs of the key, under the table; while from the other leg of the key a covered wire is run down the wall and continued to one pole of the battery; that is, either to the zinc or copper of one of the end cells of the series. If the wire from the key is connected to the zinc, which is best, the other cells must all be connected together as before described, and the cell at the other end connected by a wire to the ground.

For a ground wire at a terminal station, a water or gas pipe should be used, if possible. The pipe should be filed clean and bright at a point outside of the meter, for a surface of at least two inches. A piece of bare copper wire, of No. 18 or 20 gauge, and about four feet long, should then be taken and coiled tightly and smoothly round the pipe, and an end about six inches long left, which may be spliced to the wire leading from the battery. The ground connection should in all cases be soldered. If a pipe cannot be obtained, a hole must be dug until the earth, which is always damp, is reached, and a plate of iron, to which the wire from the key is attached, must be buried in it. It is not well to ground on a plate of one metal at one end and another metal at the other, as currents are then set up on the line.

If the line is one mile long, of No. 12 wire, with stations only at the two ends, the sounders should be about 16 or 20 ohms resistance each, and seven cells of battery may be tried, the number to be increased if necessary. If the line is but half a mile long, the sounders need only be from 8 to 10 ohms resistance. While if it is two miles long they should be 35 ohms.

The battery may be all at one end of the line. Lightning arresters should be placed at each station, between the window and the instruments. If the line is less than a quarter of a mile long, it is far better and more reliable to run a return wire than to complete the circuit through the earth. It must be understood that at the office where the battery is not located the wire must be run directly from the key to earth, the line of circuit then being from the ground at station 1 to the copper pole of the battery, though the battery, from the zinc pole of the battery to one leg of the key, from the other leg of the key to the sounder, thence to line, out to station 2, to sounder, key and ground. No relays nor switch will be required.

### Mr. Sawyer's New Book on Electric Lighting.

ELECTRIC LIGHTING BY INCANDESCENCE. By William Edward Sawyer. New York: D. Van Nostrand, Publisher. Cloth; 189 pp.; 96 illustrations. Price, \$2.50.

Mr. Sawyer has long applied himself to the subject of electric lighting. It is not, therefore, as a theorist that he writes, but as one who knows what has been done, and fully realizes what has yet to be accomplished to render popular electric lighting a success.

The first three chapters in the book before us treat of generators of electricity and their adaptability to lighting. About ten lines are given to the galvanic battery which, on account of its expense, is then summarily dismissed, the remainder of the space being devoted to a consideration of the merits of the dynamo-electric machines which are or have been used, commencing with Wilde and ending with Sawyer. Incandescent lamps are then considered, and the somewhat curious fact noted that experimentalists in this branch of electric science invariably follow the same beaten track, passing from platinum to iridium, then to both, from these metals to carbon and asbestos, and finally to carbon alone.

Various methods of manufacturing electric light carbons are described, and liberal quotations from English patents show that the charge brought against some inventors, "that they do not take pains to become acquainted with what has already been done," cannot be justly brought against the author. The most improved methods of protecting carbons in a vacuum, or in a carbon-preserving atmosphere; the subdivision of the light, and different arrangements of circuits, are described in language which is plain. The last few chapters show several forms of electric switches and regulators, and also discuss the idea of general distribution, which, after due credit being given to one Starr, is ascribed to Mr. Sawyer himself, who patented a method in August, 1877.

The book concludes with a chapter on electric lighting in its commercial and financial aspects, comparing the incandescent electric light with that of coal gas—the result of the comparison being largely in favor of the electric light.

The author, in the main, treats brother inventors with commendable respect and impartiality. He writes in a plain, common-sense style, avoiding unnecessary technicalities, and no one who may read the book can fail of having a clearer perception of what has been and is being done in electric lighting, and a better ability of judging for himself of the value of the periodical effusions of the daily press on this subject.

The mechanical execution of the book is good, the type being sufficiently large for comfortable reading, while the illustrations are fair and fully serve their purpose, that of illustration.

### The New York Electrical Society Organized.

The second meeting of the above society, on Wednesday evening last, was very largely attended, about 100 persons being present, among them several who have been prominently connected with the telegraph and kindred professions for many years, and whose presence at the meeting must have been highly encouraging to the promoters of the infant society. Letters of regret were also received from T. D. Lockwood, of Boston; D. H. Craig, Gerritt Smith, Lant S. Jones, Robt. Brown, H. W. Pope and W. Holmes, all of New York.

The meeting was called to order at 8:15 by Mr.

F. W. Jones. Mr. Jones said the first thing in order would be the reporting of the Committee on Constitution and By-Laws, and, as he was chairman of that committee, he would call upon Mr. J. D. Reid to occupy the chair temporarily. Mr. Reid accepted the position, and the report was read by the secretary.

On motion, the secretary re-read the constitution and by-laws in articles and sections. In most instances no objection was made, and they were approved as read, but in a few cases slight alterations were made.

The constitution as adopted gives the society the name of the New York Electrical Society, and its objects as the advancement of electrical knowledge among its members, the establishment of a library, a reading-room and a laboratory. Any person desiring to aid in attaining the objects of the society is declared eligible for membership. The officers are to be a president, six vice-presidents, a secretary and a treasurer. An executive committee, consisting of the president, first vice-president and four members, is also provided for, and permission given the executive committee to appoint a librarian. The initiation fee is placed at one dollar, and the dues at three dollars per annum, payable quarterly in advance. The meetings are to be held on the first and third Wednesdays in each month.

After the constitution and by-laws had been disposed of, Mr. Ashley moved that all present be considered charter members by signing the roll. Carried.

In addition to those whose names were published in last issue of THE OPERATOR, the following signed the roll:

John C. Hinchman.	C. Flood.
James D. Reid.	J. McKenzie, Jr.
R. T. Clinch.	E. J. Brandell.
A. S. Brown.	Chas. Ward Raymond.
P. P. Hauff.	George E. Holbrook.
L. R. Hallock.	Thomas B. Hynes.
P. H. Vander Weyde.	D. Harmon, Jr.
A. L. Bogart.	F. T. Viles.
W. J. McElroy.	J. T. Covel.
M. H. Redding.	F. C. Beach.
Wm. Hadden.	J. H. Emerick.
G. B. Prescott, Jr.	Wm. F. Snyder.
E. A. Leslie.	Chas. A. Willson.
C. E. Lawson.	G. H. Pride.
H. L. Bailey.	W. D. Schram.
F. Jessen.	F. W. Baldwin.
J. H. Bunnell.	S. S. Bogart.
C. M. Cunningham.	J. M. Phelan.
Charles D. Haskins.	P. J. Casey.
W. J. Hamilton.	H. D. Burghardt.
A. T. Grinstead.	W. E. Lockwood.
F. E. Kinnman.	W. A. Fenn.
Gustavus G. Wagner.	R. Carter.
A. A. Knudson.	W. C. Pearse.
C. A. Randall.	D. B. Grandy.
A. R. Wright.	S. B. Van Nortwick.
F. E. Wilcox.	J. W. English.
G. A. Newton.	David W. McAneeny.
C. F. Hutchinson.	E. G. Cochrane.
S. K. Dingle.	Joe B. Stewart.
M. Sullivan.	John B. Taltavall.
H. Wallace.	G. W. Gardanier.

The following names of those not present were also added to the list:

William Mackintosh.	Joseph Christie.
S. S. Schreff.	J. E. Fenn.
A. F. Larned.	G. A. Hamilton.
W. K. Smith.	Wm. Orton, Jr.
H. H. Ward.	S. D. Field.
J. H. Dwight.	W. J. Dealy.
A. E. Sink.	C. S. Shivler.
George A. Mudgett.	H. W. Pope.
W. Holmes.	G. G. Ward.
W. H. Baker.	J. H. Sabine.
Robert Brown.	L. S. Turner.
Gerrett Smith.	

The following officers were elected for the ensuing year:

President, F. W. Jones.  
Vice-Presidents, Geo. B. Scott, P. H. Vander

Weyde, Gerritt Smith, W. J. Dealy, Geo. A. Hamilton, and Geo. G. Ward.  
Secretary, J. W. Moreland.  
Treasurer, M. Brick.

The meeting then adjourned, to meet at the same place, the United States Hotel, on Wednesday evening, March 2, at eight o'clock.

### Electrical Sparks.

BY F. H. GREER.

The electric arc will melt steel.

No foreigners are allowed to work for the telegraph administration in England or France.

They can work one Wheatstone on quad with sounders, but can't work two Wheatstones or two dials well on the quad.

Clommond's thermo batteries are much better than the tray batteries of Sir Wm. Thomson for working the Thompson recorder (cable instrument) on very short circuits.

Over one hundred sounders are now used in the General Postal Telegraph office, London, whereas, a few years ago there was not one. The Quadruplex and Duplex there all have sounders.

In the Postal Telegraph office in London, "sound boxes" for throwing out the sound from the sounder are used extensively. They are about two feet high and shaped something like the sounding boards over pulpits.

The effect of the electric light on plants is wonderful. A very beautiful experiment is to plant mustard seed in three jars, keep one under the effects of both day and electric light, one under the effects of electric light only and the third under the influence of sunlight only.

Where a great amount of light is wanted in one place the electric light is from 20 to 133 times as cheap as gas. The actual result obtained at Albert Hall, London, where the science of putting a brilliant light high up in preference to putting a number of feeble glimmers all over a building was exceedingly favorable to electric light.

Siemens' new electric lamp requires no clock-work, but has ratchets, levers, etc. Common shot in a brass cup acting as a weight presses the levers and adjusts the carbons. A wire sieve is placed underneath to catch any burning coals that may drop from the carbons, and a wire netting is underneath the sieve to catch any pieces of glass that may drop should the globe become broken. There is also wire netting around the white globe.

### Telegraphers' Aid Society.

The Committee of Arrangements of the above Society—Messrs. Jas. K. Calvert, S. A. Coleman and J. W. Moreland—have issued the following circular:

The regular annual meeting of the Telegraphers' Aid Society will be held in the parlors of the United States Hotel, on the corner of Fulton and Pearl streets, New York City, on Sunday, March 13, 1881, commencing at 3 P. M.

The business before the meeting will comprise the reception of reports from the officers and from the auditing committee, and action thereon; action on proposed amendments to the constitution and by-laws, a notice of which is subjoined, and the election of officers and members of standing committees for the ensuing year.

The presence of every member in the city at the time is requested. Should circumstances, however, prevent a personal attendance, it is desirable that the members so situated be represented by written proxies in the hands of members who will certainly be present.

#### REVISION OF THE CONSTITUTION.

A committee was chosen by the executive committee on Nov. 14, 1880, to prepare a revision of the constitution and by-laws, and report to the society at the coming annual meeting. The report of the committee is now ready, and embraces various important amendments and a complete re-arrangement of the laws of the society. The report, with certain recommendations contained therein, will be presented to the society on March 13 for its consideration.

J. W. MORELAND, Secretary.

### The Youngest Telegrapher.

The frontier telegraph office at Williams' branch is managed by Hallie Hutchinson, a little girl nine years of age. A gentleman who returned from there a few days since says that Hallie is the most remarkably intelligent little elf he ever had the pleasure of meeting. She handles her instrument with the success and precision of an old operator. Recently, when election returns were coming in and the whole country was wildly excited to know the results, little Hallie sat at her instrument, her eyes aglow with intelligence, and gathered in the news from all over the Union, while dozens of brawny men crowded round to hear what the lightning brought, and to admire the wonderful skill of the little operator. While controlling the wires as she does Hallie is not unlike other little girls of her age in her habits and inclinations. For instance, one end of her operating table is piled full of baby dolls, and she spends a great deal of her leisure time dressing and nursing them. Brown County may claim the youngest telegrapher in the world.—*Waco (Texas) Examiner*.

Texas is mistaken. New Jersey can beat this. The five-year-old son of Frank Donahue, operator at Perth Amboy Junction, Rahway, N. J., is a good operator, and works the wires with the skill of a veteran.

F. M. H.

### A Canadian View of the Consolidation.

The Montreal *Shareholder*, commenting upon the satisfactory progress of the Dominion Telegraph Company during the past year, says:

The position of the Dominion Company under its able, energetic and deservedly popular management, has been a steadily improving one, as will be readily seen by the following figures compared with the progress of the Montreal Telegraph Company:

	M. T. Co.	D. T. Co.
1875 Gross receipts.....	\$550,493	\$146,397
1880 Gross receipts.....	550,840	299,494

The gross receipts of both companies for 1880 include the telephone sale, the Montreal Company having received \$75,000, and the Dominion Company \$69,500 for their respective interests. Gratifying as this improvement must be, it is likely to be still greater in the future, as the Dominion Company is now a part and parcel of one of the greatest telegraph corporations that this or any other country has ever known, and which is to be managed by the ablest corps of telegraph managers that the century has produced. We do not believe that this consolidation means an increase of rates in the United States. On the contrary, we think that it will more likely lead to a reduction as soon as the details are arranged and expenses reduced; and that a great and successful effort will be made to give the public a service so satisfactory that an opposition company will be an impossibility.

### Married by Telegraph.

CHICAGO, Feb. 17.—A curious marriage took place at the cantonment in the Bad Lands, Dak., yesterday, between Frank M. Shoppie and Henrietta Louisa James, Rev. Mr. Stevens, of Bismarck, officiating from that place by telegraph. Frank S. Moode and Engineer Deutsche were witnesses that the parties responded to the electric marriage ceremony at one end of the wire, while the *Pioneer-Press* correspondent and several others saw the clergyman perform his duty at the other. The questions and answers were written, telegraphed and responded to, and a blessing was pronounced in the usual form.

### An Operator Without Arms.

Philip O'Connor, of Andover, Allegany County, N. Y., from his birth has been without the use of his arms. Not to be baffled by this misfortune, however, he has made his mouth and toes serve him for many of the uses of the hands and arms. With these organs he has gained a remarkable dexterity in writing. He can also use a telegraph key with his toes or mouth, transmitting messages with wonderful skill and speed.

As an operator he can readily "receive by sound." He sews and threads a needle very quickly; plays "mumblepeg," and whittles long clean shavings with his toes. For some time he has been selling newspapers about Andover, taking the money in his mouth. He is a great reader, very intelligent for one of his years, and discusses with fluency and good sense the latest topics before the public. During the absence of the regular bookkeeper, O'Connor performed these duties for a merchant of Andover in a skillful and satisfactory manner.—*Elmira Free Press.*

#### "Western Union Athletics."

The annual spring meeting of the above club is set for the third week in May (day to be designated hereafter). The following events will be contested:

Green walk (one mile).  
Handicap walk (one mile).  
100-yard run (handicap).  
220-yard hurdle race (handicap).  
Half-mile run.  
Half-mile run for messengers in uniform.  
Quarter-mile run.  
1 mile run.  
Running broad jump.  
3-legged race.  
Tug of war, teams for day and night force.  
Tug of war, teams from line men.  
First and second medals in all events, excepting broad jump, for which one medal.  
No medals for 3-legged race or tugs of war.  
Entries, accompanied by a fee of 50c., should be sent or handed to Wm. Maver, Jr., Secretary of Committee of Arrangements, 197 Broadway, N. Y. Events open to all telegraphers.

#### Milwaukee Melange.

To the Editor of The Operator:

SIR: On Tuesday evening, Feb. 15, the Milwaukee telegraphers held their first annual reception and ball, at Saverance's Hall. Being the first affair of its kind ever attempted in this city, a great deal of anxiety was entertained as to its probable success. Tuesday evening, however, found a very pleasant party assembled, notwithstanding the unpleasantness of the weather, and everything passed off in good shape.

Congratulatory dispatches were received during the evening from Philadelphia, New York, Boston, Chicago, St. Paul, Omaha, Ogden, and one from the redoubtable "Old Man Kavanagh" as follows:

"SNOWBANK, Feb. 15.

"Secretary Milwaukee Bam:

"Bogardus, Hank Cowan and myself are on the road, but afraid we won't be able to reach you in time owing to the snow drifts. We wish you all a pleasant time. Dance some New port for us. '73' all around. O. M. K."

The committees were as follows:

Executive committee: C. H. Haskins, A. Weller, E. M. Shape, C. L. Fortier, H. M. Scott, D. H. Henshaw, W. R. Barker, E. J. Peabody.

Reception committee: R. E. Fitzgerald, J. N. Bradley, M. A. Farley, H. J. Ramsey, E. J. Hickey, A. S. Wilson, W. J. North, J. J. O'Brien.

Floor committee: J. R. Van Buskirk, P. M. Williams, E. A. Patterson, J. M. Marlet, G. W. Anderson, J. J. McGucken, T. F. Ramsey, treasurer; G. H. Davie, secretary.

Three hundred invitations were issued and even that number proved insufficient for the demand. Altogether, it was a grand success, and it is hoped the talk of a permanent organization will assume definite form.

In your last issue, in speaking of fast time, credit is given "Mr. E. M. Sharpe," of Cleveland, for the fastest sending of the official tests in 1868. As this rather touches our local pride, we beg leave to make a correction. Mr. E. M. Shape, of Milwaukee, the worthy chief operator of the W. U., did the sending from this office, Mr. E. Curry, now secretary of the N. W. Telegraph Co., Kenosha, Wis., being the receiving operator at St. Paul.

The N. W. force has been somewhat disarranged by the temporary absence of Chief Barker, caused by too much rheumatism. Mr. B. made a brave stand, but was finally beaten and obliged to take a vacation, leaving Night Chief Fitzgerald in charge and Operator Brady, of the day force, in Mr. F.'s place, as night chief,

This causes the employment of Messrs. Nicaud and Brown on the night force. Both are genial and accomplished telegraphers. We are informed (though not officially) of the engagement of a N. W. lightning manipulator to a west side Bell. If this thing continues, there will not be an unmarried man on the force by spring! It becomes our pleasant duty this week to chronicle the marriage of Mr. J. R. Van Buskirk, the well-known and very popular operator at the Wisconsin Central "Fd." office, this city, on Tuesday evening, Feb. 8, at Christ's (Episcopal) Church, to Miss Hattie Powell, the handsome and highly accomplished daughter of Mr. W. H. Powell. The happy couple have the hearty congratulations and good wishes of their hosts of friends.

OCTOPUS.

#### Notes from Texas.

To the Editor of The Operator:

SIR: Mr. John T. Patton has resigned here and accepted a position at the Galveston Cotton Exchange. Though young in the service, John possesses the requisite qualities for a coming star. For the vacancy two "plumes" thus far have been tried. The first remained two days. He expected a failure, as he kept his big coat on and devoted his whole attention to a railroad line near the door. The second one merely looked in, heard the confusion of thirty instruments, said he would be around in the morning, and, like that other Arab, silently stole away. The company are again in search of a first-class man for sixty dollars.

Mr. Henry Stanberg, our old day chief, has left us, accepting service at the Auditor's office of the Texas & New Orleans R. R., as operator and clerk. Mr. John McNabb, of New Orleans, now presides over the day force. Houston's present force is as follows: Mr. James W. Stacey, manager; Mr. John McNabb, day chief; Mr. Geo. H. Leach works the Galveston wire, and Mr. Phil. Fall the Brownsville circuit. All messages to and from Mexico pass through "Phil's" hands, and when he lets go of them, Mexican or otherwise, you can gamble on them.

Prof. F. Derbyshire, who has more heart and good humor to the square inch than anyone else, works the Menger Hotel line, when not otherwise engaged. We look for cards from the Professor shortly. Mr. J. W. Brooks is night chief, and has no superior as an operator and a gentleman. Mr. Wm. E. Carberry is press man, and does his work in approved style. He has been seriously thinking of leaving us, but Col. Stacey has induced him to remain. Mr. Jerry Newton is our cashier, and affably waits upon customers. He is a most clever gentleman, and prevents many an operator from "spacing" between pay-days. Mr. Charles Randolph is bookkeeper, and the society man of the office. Old Charlie Hoffman last, but not least, weighing 210, is our go-ahead repairer and batteryman. Charlie is a Texas landmark.

The cable steamer, after lying off Point Isabel nearly three weeks, on account of severe weather, made her landing to-day, completing connection between Texas and Tampico, Mexico. The English contractors who are doing the work expect to finish the section from Tampico to Vera Cruz, and to turn the cable over to the cable company by the latter part of the present month, when it will be immediately opened for business. Mr. Driver is manager of the Texas end, assisted by three operators. The latter receive ninety dollars per month for the first year and one hundred for the second.

The Western Union has a big finger in this cable, and I suppose they will virtually control it.

LCIE STAR.

HOUSTON, Texas, Feb. 14, 1881.

#### Chicago Notes.

To the Editor of The Operator:

SIR: There is a scarcity of news here just at present, though this is in part made up for by rumors of changes, official and otherwise, which it is supposed are soon to take place as a consequence of the "new deal." In the mean time, all are indulging in grand and jolly anticipations regarding the ball on the 24th. The prospects are encouraging. We will be able to give you a report of it for the March 15 issue.

A certain operator of this city, whom we may call Smith, recently took a seat in a street car,

opposite a prepossessing young lady. They had casually glanced into each others eyes. He thought: Lovely; probably a banker's daughter, or a clergyman's idol. She thought: Doubtless distinguished; plumed knight, or a count. Both had sighed, and modestly relapsed into a reverie of reserved but mutual admiration, when the car door was opened, and in walked a valuable friend from Oshkosh; and, closing and backing the door, this was his greeting: "Hello, Smith, what time did you get off last night? Everything out of gear, they say! Saw a letter for you, respectfully referred, you know; look out for the 'sweat box' (managers office)." You can imagine Smith's feelings, and the young lady's surprise, as she doubtless revolved in her mind the presumable and infamous nightly practices of Smith and his liability to inherit, instead of marble halls, a home in a dungeon; and, also, the inquiring glances of the other passengers. Smith says he has not a revengeful disposition, but that if he could have placed a "stuffed club" in the hands of the conductor and the chief engineer of that street car, and could have witnessed the hurried exit of Oshkosh, his soul would have rejoiced.

How long it takes some operators to learn that heretofore "unwritten law," which may be bulletined about as follows: Never talk shop within earshot of strangers, for it is not in good taste to publicly parade your calling, or to habitually converse in a manner unintelligible to your listeners, for the reason that exaggerated eulogies of yourself or of anybody else are sure to call forth detracting observations that you would blush to hear. If you must talk in public places, and can do so intelligently, let your topic be chosen upon subjects of public interest. If you must "talk shop," of all places on earth, let a street car or a restaurant hold you silent.

CHICAGO, Feb. 22, 1881.

INEWRI.

#### Boston Notes.

To the Editor of The Operator:

SIR: From this point (the old State House) the bulk of Boston's commercial business is transacted. All the railroad agencies, shipping, banking and brokerage business, is sent from this office. Business at this time is enormous, and larger than ever before. Business is transacted here with the greatest dispatch and lightning-like rapidity, and could not be improved upon, or even equaled by any changes. No. 109 State street, the Western Union general office, is not so centrally located; hence the old State House has become the principal telegraph office, and the great telegraph centre of Boston. This bustling scene of activity is presided over by the courteous and popular Tom Calahan, a brother of the celebrated electrician and inventor, E. A. Calahan. John McGrath, "handsome John," is the principal cashier and accountant. He is assisted by several juveniles to receive business from customers. Mr. Marcy attends to the Boston Stock exchange, which is an adjunct of this office, and whence there are direct New York wires. Dwyer and Donovan manipulate the New York stock wires, with Waldo as relief. Lenhart is on the New York City quad. Mr. Devereux has charge of the branch offices and all are under the liberal and magnanimous Mr. Milliken, the manager of all the W. U. offices in Boston.

The American District and Gold and Stock also have offices adjoining the Western Union in the old State House, and Suel Smith, the genial old-timer, has general charge, making his headquarters here.

SARA B.

BOSTON, Feb. 21, 1881.

#### THE TELEGRAPH OPERATOR.

She sits within her narrow cell,  
A jewel worth a fairer setting.  
And I—I linger for a spell,  
My urgent telegram forgetting.

I love the sounder's cheery call,  
I love to watch the dimples playing  
About her fingers, white and small—  
I wonder what that hand is saying.

I love to dream of other years,  
Of blessings that perhaps await her,  
Of sweet eyes never dimmed by tears;  
I love—I love the operator!

—Jacob F. Henrici, in *Scribner's Monthly*.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, MARCH 1, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give *old* as well as the new address.

### SUBTERRANEAN LINES.

Since the recent storm in London, and the ensuing interruption to telegraphic communication, which seems to have been felt so keenly by the British public, the English newspapers have been calling upon the Postmaster General to place the wires underground. That system has been measurably satisfactory in Germany, where there are now eight thousand miles of underground wires, and it would not be a bad idea to commend the German system to the attention of the managers of the new Western Union.

It is the opinion of many telegraph engineers that overhead wires are best for all working purposes, when strongly built and properly attended to, but they are certainly more expensive to the companies in the long run. In this respect, Mr. Siemens has recently written that, on all the 8,000 miles of underground wires in Germany, some of which have been down for five years, no expenditure whatever has been incurred for repairs in that time, and, "judging by the perfect condition of the cables, it is not likely that any repair will be required for many years to come." It is thus to be seen that the interests of the companies, from an economical point of view, lie in a perfect system of underground wires. It is, therefore, to be inferred that the various telegraph companies will lose no time in burying their lines; especially since the telegraph, telephone and electric light wires are increasing so rapidly in the larger cities.

But we certainly consider it a hardship that legislation should be invoked to compel the companies to place their wires underground before they are quite ready to do so, or have decided upon a plan suitable to the exigencies of the occasion. The English system is recklessly expensive and far from perfect; indeed, it is not too much to say that there is not now in existence any system of underground telegraphy which can be called perfect. The telegraph has done, and is doing, a vast amount of good, and no hasty legislative action should be taken to impede its progress. The passage of a law to compel the placing of all wires underground would only have the effect of decreasing the number of wires worked; and, consequently, such a law would stand in the way of the growth and development of the telegraph business.

We see no reason why the wires should not be run overhead, since there is plenty of room up there, if the ample space were properly utilized, to accommodate all the wires which we shall

need for many years to come. Line building might be under the superintendence of some municipal bureau, to which plans and specifications would be submitted prior to the building of a line, and which should insist upon a scientific arrangement of the wires, and upon all poles, fixtures on buildings, etc., being built in a substantial manner. But, whatever justification may be offered for a law compelling the companies to adopt the subterranean system, it is certainly an unwise act to compel every individual who wishes to connect his factory with his office, or his office with his residence, to place the wire underground.

Underground telegraphy is sure to come in the future, but meddlesome and oppressive legislation on the subject will only limit the usefulness and impede the progress of the telegraph. If we are to have a successful competition, the struggling young companies must have some freedom in extending their system.

WITHOUT referring specially to the present gigantic telegraph monopoly, it might be well for deep thinking people to inquire just how far the Congress or local Legislature of a country which boasts of freedom can go toward suppressing trade combinations without setting a woefully bad precedent. We have no love for a monopoly, yet in the interest of fair play it might be pertinent to ask whether or not the holding of "exclusive privileges" acquired in the regular ebb and flow of trade is wrong. If so, where is the incentive for an individual tradesman or a corporate body to toil for 25 or 30 years to obtain at great sacrifice valuable contracts with kindred tradesmen or corporate bodies? Is it wrong for a tradesman to acquire, by purchase or invention, "exclusive privileges" under particular patents; such as, for instance, the Western Union's claim to the quadruplex, Page patent, etc.? If a citizen of one State doing business in another wants to surrender his shop, good-will and custom, close up and go home, how can the Legislature of that State compel him to return thither and open up and transact a business which he has abandoned as distasteful or unprofitable to him? In the case of two rival steamboat lines, where the traffic is found insufficient to pay them, must they, under the law, keep on running at a loss until both are financially ruined? Or, if one of those corporations wisely determines to save the remnant of its original capital by withdrawing from the contest and placing the money thus rescued in some better paying business, must it, under the law, burn or sink the steamboats for which it has no further use; or may it not sell them to its conquering rival—the only party who could possibly have any use for them? Then it would be interesting to ascertain to what extent the laws of a free country can prevent an independent citizen from selling his own property, anyhow, when he feels like it. If it is settled in law that one of two competing companies cannot sell to its rival the property which would be utterly useless to any one else, it would be still more interesting to learn if the law would permit a third party to step in and buy the property of both. If a hitherto disinterested party can legally buy from one he can buy from the other, and the double purchase would form a monopoly equally as offensive as the one formed by consolidation. Finally, if for a shrewd, even a grasping, tradesman to profit by the natural results of his superior tact, talent and enterprise be declared wrong, is it not more consistent with wise and free doctrines to leave the matter to

be settled by his patrons rather than to call in the police? But, whether coercive measures against the monopoly are right or wrong, it is certainly a dangerous experiment for presumably leading citizens to teach, as was the case at Cooper Institute the other night, those who may be of a Communistic turn of mind to sing such a song as, "We'll hang Jay Gould (in effigy) on a sour apple tree." That, certainly, is playing with fire.

A CORRESPONDENT from Rio de Janeiro writes to *THE OPERATOR*, requesting to be informed "How it is that on a cable that is working badly the signals become suddenly very large, and last for a week or two, then the cable breaks?"

In the absence of any data concerning the length, construction and method of operation of the cable, which data our correspondent has unfortunately omitted to forward, we are necessarily left, to a great extent, where Moses was when the light went out, *i. e.*, "in the dark;" and consequently can but put forward as an hypothesis the following explanation:

In a cable of any great length there is considerable retardation from static induction. That is, the cable acts like a Leyden jar. A large portion of the current sent into it at the sending end is retained by the capacity of the cable, only a portion of it arriving at the distant point, and this showing more plainly the *better* the cable is insulated. We will suppose the cable in question to be perfectly insulated, the retardation being correspondingly apparent. It is well known that one of the methods adopted to obviate this retardation is to attach a wire from the conductor to the earth, through a resistance so great as to interfere but little with the signals.

We may, therefore, assume the cable which has been working hard now to commence leaking at various points through the insulation. It being thereby put in connection with the earth, is enabled to discharge quickly, and the leakage, not being sufficiently great to abstract much of the current, the signals at the receiving end, being relieved of the retardation, come out strong and sharp.

This condition of affairs continues for some time; but a leaky insulation once commenced does not ordinarily cease, and the defective insulation increases until, finally, the water reaches the conductor at the same leaks at which the electricity escapes, and, in conjunction with the galvanic actions of the current, eats the conductor first to a needle point, and at last in two, when continuity is, of course at an end.

WHATEVER charitable people may think of the crazy, notoriety-seeking young persons who get "married" by telegraph, every religious sect owes it to its own reputation to discountenance the "clergyman" who takes part in such a circus. We hoped that the silly practice had been abated, but, judging from later reports, the fools are not all dead yet. There can be no more binding partnership than that of man and wife, and there is certainly no less binding manner of making a contract than by telegraphing the terms and acceptance. There is in all the list of the miseries and heartburnings of mankind no hermit so lonesome, no victim so utterly defenseless, as a discarded wife whose claim to recognition is doubtful in law. The old style of marrying, in the presence of *all* the parties interested, is prosaic; but while the new telegraphic style affords a certain amount of amuse-

ment to the idle spectators in two towns, its most enlivening qualities lie in its awful possibilities. There is, of course, excuse for young and thoughtless people, but the Church should be the bulwark against which the tide of irreverence and idiotic novelties should roll in vain. There is no law to prevent certain crack-brained people from imposing upon themselves new agonies and prospective sorrows, by raveling the legal technicalities and entanglements which already afford so much work to our divorce courts; but it is disheartening to discover the fact that such people can always find some sacerdotal pettifogger willing thus to trifle with his sacred office. Should it become necessary, in years to come, for this Friar Tuck of Dakota Territory to swear in court that he married this particular couple—neither of whom, of course, he ever saw—his testimony would not be worth a red cent. We might also, for the sake of truth, say the same of his sense of dignity.

BY the death of Congressman Fernando Wood the telegraph lost one of its earliest friends. The first efforts of Mr. Wood in Congress were devoted to the success of the application to give the aid of the Government in showing the practicability of the transmission of intelligence by magnetic or electric telegraph. Until the year 1842 no such proposition had been made; indeed, Professor Morse himself had not until then reached that degree of confidence in its feasibility as to venture upon an extensive application of it for useful purposes. When Professor Morse made his application to Congress for an appropriation sufficient to lay wires along the sleepers of the railroad track between Washington and Baltimore, and Congress and the public generally were evidently averse to the scheme, it was Fernando Wood who was most active in bringing converts over to the new idea. At his instance Professor Morse placed a battery in the room of the Committee on Naval Affairs, of which Mr. Wood was a member, and connecting it by wire with another battery in the committee room of Naval Affairs in the Senate, showed, by the transmission of communications from one to the other, that the plan was sufficiently feasible to warrant an appropriation, if only as an experiment. Morse, as is well known, became almost discouraged; but by the youthful energy and enthusiasm of Fernando Wood, aided by Charles G. Ferris, then a member from New York, the bill was finally carried though, the money appropriated, and Morse made the Superintendent at a salary of \$2,500 per annum. Professor Morse never ceased to recognize the great obligations which he and the world at large were under to Fernando Wood for his early appreciation and active support of the telegraph.

WE are gratified to notice that subscriptions to the Boyce Fund are flowing in steadily, but there are still some particular sections from which we should be glad to hear. The thrifty and provident person should be commended, but this is a case where no purely economical reason should stand in the way. The Boyce claim is an equitable one, and each member of the Telegraphers' Mutual Benefit Association should take a personal pride in seeing it paid to the last farthing. The officers of the Association are right in vigilantly watching its interests, but when it comes down to being thoroughly mean and stingy with the helpless widow and orphan, the Association stands sadly in its own light. In this way confidence is forfeited, and that fact is best exemplified in the gingerly manner in which level-headed men look

askance at that "Second Division." Let us have the unfortunate victims of the First Division settled with before we commence another branch of the concern.

WHATEVER may be thought of the merits or demerits of the telegraph consolidation, there is no doubt of the popular antipathy toward it, and the universal demand for full and free opposition. But our law-makers cannot give us fiat telegraph companies in the same free and easy, off-hand way that they give us fiat money, any more than they can compel a company to do business after its managers have declared it unprofitable or distasteful to them. We want solid sense in this matter, and if the Statesman is going to give us relief he had better abandon useless talk, plank up the money and let us get to work on new lines. Then we want honest and experienced managers, a remunerative tariff and fair living salaries for the employes. We have no use for lawyers.

It was quite amusing, last week, to see some of our non-reading telegraphers skirmishing around for a copy of THE OPERATOR, and unable to get one for love or money. It is becoming more generally understood that a man must read to keep abreast of the times, and that if he doesn't read he is morally sure to be "left" on the home-stretch. The man who buys his paper regularly and reads it attentively knows, at least, what is going on, even if he can't boss the job. He who fails to familiarize himself with the details of his work, and the governing spirit of the workers, incapacitates himself for that advancement which comes sooner or later to every wide-awake, zealous worker.

OUR esteemed contemporary, the *Evening Post*, in describing editorially the panic of Black Friday, revives the ridiculous fallacy, which has been so often exploded, that, during the excitement, "it was, in fact, in evidence that instances occurred when the wires melted, or burned off, in the efforts of the operators to keep up with the news!" Yet this is the average style in which the Metropolitan papers discuss the telegraphic situation. The rural papers have just commenced to expatiate upon the iniquities of William H. Gould, Hamilton McK. Eckert, Jay Green, General T. T. Twombly and Dr. Norvin Vanderbilt.

As an indication of the great earning capacity of lines of telegraph, it is worthy of note that Dr. Norvin Green, in a recent affidavit, says that since July, 1866, the Western Union Company has expended, over and above dividends to its stockholders, surplus earnings to the full amount of \$16,939,003.55. This vast sum was expended for the construction of new lines, erection of additional wires, for letters patent, for the purchase of other telegraph lines and the stocks of other telegraph companies, real estate and supplies and material.

In addition to their full page advertisement of the steel lever key in last issue, giving testimonials from many of the best known telegraphers in the business, Messrs. J. H. Bunnell & Co. today take another page in which to bring to the attention of telegraphers their Morse Learners' Apparatus and other standard telegraphic and electrical instruments and supplies. This firm does a large business in these goods, and its reputation among telegraphers and the trade is not excelled by any house that we know of.

EVERYONE has heard of "Deaf Hoffman" receiving by sound, and we have had many other prodigies in our ranks from time to time, but by far the most marvellous of all is Philip O'Connor, of this State, who, being without arms, sends either with his mouth or toes, and "transmits messages with wonderful skill and speed." There is, or was, in Binghamton, N. Y., an operator named Patrick Shea, who, having lost both arms in a railroad accident, performed all his duties as operator by the aid of cork substitutes.

THE publication, in our last issue, of the engraving of General Eckert took the place of our regular monthly addition to Our National Portrait Gallery, which should otherwise have appeared to-day. Consequently we have been compelled to postpone the regular contribution of our album until the first of next month, when the chosen subject—a popular and worthy representative of New England—will give satisfaction to all.

THE inauguration of an electrical society in this city is a subject well worthy of the attention of every telegrapher. For the encouragement of electrical science and stimulating the professional mind to search for new truths, such an institution as this is a much needed benefit to the telegraphers and the telegraphs of this vicinity. Under the guidance of the able President, Mr. F. W. Jones, the new society should rapidly become eminently successful.

SOME of the city papers are complaining of the charges made by the telephone company in New York. In Ohio a bill has been introduced in the Legislature forbidding telephone companies in cities of the first and second class to charge more than \$2 a month rent for any instrument. Of course such a bill will never pass through a body of fair-minded men, but it serves to show the temper of the public, and our telephone people might be guided accordingly.

MR. FRANK W. JONES, who has been chosen president of the New York Electrical Society, is excellently qualified for the position. His experience with the Chicago society will be of great service now, and his extensive knowledge and undoubted executive ability will go far toward establishing and popularizing the infant organization.

THE engraving of Gen. Eckert, in our last issue, and the letter-press have been freely commented upon as being equal to anything appearing in *Harper's Weekly* or any of the magazines. We have modestly given all the credit to the perfection which American workmanship has reached.

In referring, in our last issue, to the record of fast sending, we should have said that Mr. E. M. Shape, of Milwaukee, sent 2,631 words in one hour, instead of Mr. E. M. Sharpe, of Cleveland.

WESTERN UNION stock is quoted at 110 American Union at 67½, and A. & P. at 44. Last issue they were 111½, 79½ and 46½, respectively.

Now, if Mr. Edison would get Mr. Jay Gould to consolidate with his electric light it might be brought from obscurity.

THE consolidated Western Union Company has now over 300,000 miles of wire and over 10,000 offices.

## TELEPHONE DEPARTMENT.

They had a parrot talking through a telephone in Louisville the other day.

Paris is to have an addition to its telephone lines which will complete the circle of communication.

From Egypt it is reported that the Ministerial consent has just been given to a telephonic exchange for Cairo.

Lowell, Mass., may be called the "telephone city," for it is connected by telephone with over one hundred cities and towns in the States of Massachusetts, New Hampshire and Rhode Island.

A bill has been introduced in the Ohio Legislature, forbidding telephone companies in cities of the first and second class to charge more than \$2 a month rent for any instrument, and making companies which violate this schedule liable to an action for debt, to pay the aggrieved person not less than \$300 nor more than \$500.

The Telephone Department of New Zealand having procured a supply of Edison-Bell telephones, state that they are prepared, if sufficient applications are received, to establish the telephone exchange system in Wellington, the annual charge for which will be £17 10s.—*Electrician*.

We last issue gave a list of telephone companies not frequently heard of, and added that against some of them the American Bell Company had commenced suits for infringement. The Law Telegraph Company, of this city, writes to say that it is not one of the companies of questionable standing, as it uses only the Bell telephones.

It may not be generally known that conversation can be carried on through the human body. Try it by disconnecting one of the main wires from the top of a call bell. Let some person take hold of this wire while half a dozen others clasp hands, the last one laying his finger on the bell where the wire was taken from, and you will find you can talk very well through the six persons.

A telephone exchange manager writes: "A subscriber's circuit for several days was all right during the day, but about seven o'clock in the evening it would grow very weak, showing great resistance interposed. The cause was traced to the earth connection at the gas pipe near the ceiling over the chandelier. When the gas was burning the heat expanded the spirals of copper wire, thus making the connection an imperfect one."

At Kokomo, Ind., Feb. 11, as a part of an entertainment at the opera-house, music was transmitted by telephone from Indianapolis, 55 miles distant, and delivered to the audience from a single pony crown receiver, to which a tin horn three feet in length was attached. It had been raining along the entire line, yet cornet, French harp and vocal solos were heard over the entire hall, to the agreeable surprise of those having the entertainment in charge.

The telephone companies have sent in their bills to their subscribers for January. This is impudence itself. On Jan. 15 a storm occurred, which prostrated the telephone lines in every portion of the city, and in most cases the lines are not in operation yet. The companies have no right whatever to demand pay in the absence of service performed, and let us trust subscribers will make them so understand it, for their charges are excessive, anyway.—*N. Y. Truth*.

The Boston & Northern Telephone Company, with a capital of \$500,000, comprises the exchanges of Salem, Haverhill, Lawrence, Newburyport and Gloucester and owns and controls lines as far north as Manchester, N. H., and eastward to Portsmouth. The company has also bought of the Portsmouth Bell Telephone Company all of Rockingham County, N. H., business, consisting of the exchanges of Exeter, Dover, Great Falls and Portsmouth as well as the Lynn (Mass.) exchange of the American Bell Telephone Company, of Boston. The B. & N. Company now has five trunk lines to Boston, and intends running more in the spring.

Since the adoption of the new system of calls by members at the telephone office at Portland, Me., many mistakes have occurred on account of

wrong connections, and some have resulted in amusing conversations. Recently the telephone bell in a prominent business house rang and the proprietor proceeded to attend to the summons. A female voice was heard, and the following questions and answers ensued: "Hello!" "Yes." "What time are you coming home to supper tonight?" "Why, I've been to supper." "I'd just like to know whom you took supper with." "Why, with my wife of course." "How many wives have you, anyway?" "Look here, whom do you think you are talking with?" "With my husband, Mr. ———." "Not much, you are talking to Mr. ———." Upon this the gentleman heard a scream which appeared to be echoed by a number of other ladies in the same room.

The Patent Office, after careful hearing, has granted to Mr. E. Berliner a reissue of his original telephone patent, of January 15, 1878, with several new claims, among which is one that virtually awards to the above author the priority of invention and use of the local battery in conjunction with telephone instruments. Prior to the invention of Mr. Berliner it was necessary to yell very loud in order to make anybody hear at any considerable distance through the telephone, and even then the speaker's voice was heard quite faintly; but now, with this improvement added, the telephone is rendered so sensitive that conversation in whispers may be readily carried on, and the ordinary tones of conversation are delivered by the instrument in the most perfect and admirable manner. Mr. Berliner is entitled to the highest honor for his remarkable invention, which is now used in all parts of the world. The patent is held by the American Bell Telephone Company, of Boston, Mass.—*Scientific American*.

## DASHES HERE AND THERE.

They are now talking of attaching electric lights to buoys in harbors and off the coast.

On the 12th of March, 1790, Professor Daniell was born. His name is familiar to every electrician.

"Let's consolidate" is what the bashful telegrapher now says to his girl, and she replies, "We Union."

The Edison Electric Light Company of Detroit was organized in that city on the 15th ult., with a capital of \$500,000.

A recent fatal accident on the North Pennsylvania Railroad, near Quakerstown, Penna., was caused by the omission of one word from a telegraph dispatch.

The Chicago *Inter-Ocean* has leased a wire for a term of years from Washington to Chicago, and now handles its own dispatches with its own wire and operators.

The severe weather experienced in Prussia has delayed the completion of the Siemens-Halskie electric railway at Berlin. It was expected to be open for traffic at the beginning of last month.

A bill has been introduced in the Senate of Pennsylvania requiring the original copies of telegraph messages to be retained for three years, and to be produced in evidence in court when required.

A committee of Congress has reported in favor of accepting the proposition of the Northern Electric Light Company to light the Capitol and adjacent grounds, and the matter has been referred to the Appropriation Committee for further investigation and action.

The International Exhibition of Electricity, which is to open in Paris in August next, is already an assured success. During the past two weeks the government of Germany has given its adherence to the plan. The exhibition will be held at the Palais de l'Industrie, which is lent by the French Government for the purpose.

An Indianapolis superintendent recently sent word to an operator at a distant station to mend the break there. "Can't go out; storm is too bad," was the answer. "Storm or no storm, fix the thing!" "Hain't any ladder." "Go out and climb the pole." "Can't climb." "Why can't you climb a pole?" "I'm a woman."

The telegraph office of Neustadt, near Vienna, has had a narrow escape. It appears that a meteoric stone fell in the road before the door with a terrific noise, and accompanied by a brilliant

flash of lightning. The stone, which was afterward exhumed from the hole it had made in the road, was weighed in the presence of scientific men, and found to be 375 grammes in weight. It was covered with metallic incrustations.

Assessment notices (No. 139, assessment \$1) have been issued by the Telegraphers' M. B. Association, to meet the claims of the heirs of the late J. Oscar Belmore, of West Las Animas, Cal.; Patrick Callahan, of Bloomfield, Ind., and Wm. J. H. Bok, of Brooklyn, N. Y. Assessment No. 2, (\$1) in the second division has also been issued in behalf of the heirs of Wm. J. H. Bok.

An advertisement will be found in this issue of the Blanchard Food Cure Company. This company makes a specialty of supplying foods of various kinds, adapted to serve directly as curative agents, and its success has been simply marvellous, as will be seen by a visit to the company's place at No. 27 Union Square, this city. Circulars, explaining the aim and object of the company, will be mailed free.

The Cedar Tree Mining and Milling Company, whose property is situated in Pioneer District, Pinal County, Arizona, adjacent to the Telegraph Consolidated mine, was organized in this city Feb. 23 by the election of the following officers: William Williams, President; Vernon Seaman, Vice-President; Lindley F. Seaman, Secretary and Treasurer. The offices of the company are at No. 58 Broadway.

The lamps in the Capitol and the streets of Washington are to have, in the aggregate, not less than 2,500,000 candle power. When all is completed, if the method is successful and accomplishes all that is claimed for it, the Government is then to pay the company \$350,000. Nothing is to be paid in the event of failure. The cost of operating this system will be about \$60,000 per annum, a saving to the city of \$95,000.

A New Orleans man lately cabled to a friend in Cuba, "Send me one or two monkeys." The reply came back: "Shipped you 75; will send rest as soon as can be found." The telegram had gone: "Send me 102 monkeys." The balance of 27 have been countermanded. This throws 75 monkeys on the hands of the delinquent company, and they will, of course, be divided into thirds, in accordance with the general rule. This will allow 25 monkeys to the sending operator, 25 to the receiver and 25 to the company.

Notwithstanding the unprecedented length and severity of the storm, telegraphic communication with the large centres has been well maintained, and in some instances at a high speed. For example, one day last week more than 2,000 messages passed over a single wire between London and the north of England in nine hours, a fact which, considering the state of the weather and the exceptional length of telegrams in this country, has probably never been equaled in any other.—*Electrician*.

A dispatch from Denver, Col., on the 18th ult., says: "The City Council last night accepted the proposition of C. C. Ruthraaf and others for lighting the entire city with the Brush electric light for two years at \$14,000 per annum. The light to be furnished is guaranteed to be four times greater in the aggregate than could be furnished by the same number of gas lamps. The city is to have a thirty days' trial of the light before its final acceptance."

February 16th, in this city, articles of incorporation were filed for a new Electric Indicator Manufacturing Company. The object of the company is to manufacture a new district messenger call, a round nickel plated box about two and a half inches in diameter, around the inner edge of which are placed ten buttons on which are designated the calls, such as "Doctor," "Messenger," "Police," "Fire," "Carriage," "Coupé," and other "specials." The wire connects with an annunciator in the district office, where the call is shown on a large indicator with the number of the call-box, and remains exposed until the clerk attends to it.

The sixth annual meeting of the Canadian Telegraphers' Mutual Insurance Association was held at Montreal on the 18th of January. It was then reported that the whole fiscal year had passed without a death, and that the membership had steadily increased, showing a gain of 21 members over last year. There was a cash balance of \$661 on hand. The amount paid to the heirs of deceased members averages about

\$625, at a cost of only about \$4.50 per annum. The following officers were elected for the ensuing year: President, Charles Bourne; Vice-President, James Stephenson; Secretary-Treasurer, J. S. McConnell. Committee—A. Grant, C. R. Hosmer, B. J. Hickey, J. S. Mackenzie, H. P. Timmerman, J. Murray and W. J. Graham. Advisory Board—N. W. Bethune, T. C. Elwood, E. Pope, J. T. Townsend and D. Van Nostrand.

A dispatch from Ottawa, Ontario, dated Feb. 21, says that the Senate has amended the act to incorporate the European, American and Canadian Cable Company, limited, so as to restrict the rate to be charged to 50 cents per word on every message sent over the company's lines from the point where the message is received in Canada, as far west as Ontario, to any point in Great Britain and Ireland, or vice versa. Among those who have petitioned in favor of the bill is Lord Walter Campbell, the brother of the Governor-General. In the Senate, on Thursday last, an amendment proposing to strike out the clause restricting the rate for messages was rejected, and the bill was read a third time and passed.

A special cable dispatch from Paris says: Several successful experiments were made at the Palais Bourbon with an electric reporting machine, which it is proposed to introduce into the Chambers. The machine has the appearance of a small piano, and is played like that instrument by an operator on a keyboard of ten notes. Three notes are set apart for reporting foreign quotations. As fast as the orator speaks the operator touches the keyboard, on which each sound has a corresponding key. The machine instantly represents the sounds by conventional signs on a strip of paper. The signs have afterward to be translated. About two years are required for learning how to manipulate and make use of the instrument, which is the invention of an Italian named Mitchell.

## NEW YORK CITY ITEMS.

### Echoes from 195.

The "fly sender," Mr. Brandell, has inaugurated the "close crop" style of hair cutting, anticipating Operator Minier by a week.

Messrs. Gould, Eckert and Bates, accompanied by several friends, visited the general operating department last week and inspected the switch, tubes, etc.

Extra service is again in vogue and the boys are happy. Business is beginning to "boom," and the prospects are favorable for operators for awhile, at least.

Indications point toward a newly painted ceiling and general cleaning of the operating-room this spring. Masons are already at work patching up the falling plastering.

Mr. J. H. Dwight, the popular chief-at-large, had a slight paralytic shock on Sunday, which has rendered his right hand useless, though only temporarily, it is hoped.

The garb of mourning makes its appearance among the ladies in the city line department very frequently. Both Miss Fannie Crawford and Miss F. L. Dailey have very recently been called upon to mourn the loss of a father.

The Worcester, Mass., *Spy*, of Feb. 10, contained the following, which may interest the many friends of the gentleman named: One of the happiest social events of the season was the marriage of Miss Alice C., daughter of C. B. Eaton, at his residence last evening, to Fred N. Cooke, of New York; the happy couple will return to the city for a short visit in a few days.

The long and unexplained absence, coupled with a story of a body at the morgue resembling Mr. James Crate, led to a search being made for that gentleman. Two parties were dispatched from 197, one to visit the hospitals, the other the favorite resorts of "Jim." Dennis Brown succeeded in gleaned information that led Mr. Crate's many friends to rejoice that he was still in the land of the living.

### Other City Items.

The American District Telegraph office, corner Broadway and Park Place, was damaged by fire on Sunday to the extent of \$500.

A steamer in the middle of the East River set fire, recently, to a building on shore. The curious accident occurred in this way: The ice

caused the steamer to drag her anchor, which cut one of the river cables. The grounding of the wires heated things up so that the wooden cable-house on the Jersey side was set on fire.

The success and prosperity of the Mutual District Messenger Company seems to be pretty well assured. Two offices are already in operation, and, although less than a month old, the business transacted exceeds that of the same offices of the American District Company. The new company's office at 6th avenue and 46th street is conceded to be the prettiest and most attractive office ever fitted up for district purposes.

In order to permit the passage of telegraph wires over the big tenements and warehouses in the vicinity of the East River Bridge, on Franklin square, about a dozen workmen were engaged on the 14th ult. in raising a long and heavy pole at the corner of Pearl and Oak streets. They had got the big pole into an upright position in a deep excavation beside the smaller pole which it is to replace. Two men were sent aloft on the larger pole to tie it to the smaller one, when the loose earth underneath gave way. The two men jumped from their perilous position and landed on the tracks of the elevated railway. As they received only a few scratches in their thrilling leap for life, their escape is considered miraculous.

One of the ladies at "145" writes: "One day last week, our worthy chief being absent, a young and dashing fellow was sent up from the other end of the room to act in his place. He didn't seem to know how to take his sudden elevation, or rather didn't fully appreciate the height to which he was elevated, for toward noontime, after a noticeable silence of some moments, he stunned every one by saying: 'I have it!' When asked what he had, he replied: 'Can any one tell me why the Western Union Building is like the Hudson River? That's an original riddle.' Every one, of course, 'gave it up,' and his supreme moment was when he said: 'Cause it can't climb a tree!' If he wasn't 'elevated' back into the room from whence he came, 'twas only because the Manager was seen approaching."

THE CONTINENTAL LINE.—The Continental Telegraph Co. is alive yet, consolidation not having reached us. Our general office, under the efficient management of Mr. J. G. Case, with Mr. M. S. Smith as assistant manager, is made pleasant for Mr. J. J. McAllister, chief, who keeps Messrs. D. F. Forbes, W. Perry, J. Murphy and Miss Nelson busy as regulars, with several extras on the 10 to 3 trick. Mr. W. McDonald looks after the "errors." Mr. John Hanson, the famous "7," is in charge of the delivery department.

At "Fx" we have Mr. Ed. Roemer; R. S. Smith, "O," presides over the Stock Exchange office, with the fast man, Silas Ling, and Thos. Morgan, late of A. & P. At "Cx" is Miss I. H. White, assisted by Adolph Bosse. At "Bx," Mr. F. A. Cloudman is manager, and L. W. Arwell, J. B. Place and J. M. Quill, operators, with Thos. J. Casey as clerk and way wire man. At "Fx," Henry Zollicoffer looks after the fish business. At "Nx," Mr. A. R. Reeves is manager, with Miss Flint to keep the dry goods wire clear.

THE OPERATOR is always found in these offices, nearly every man being a subscriber. Though not as yet included in the consolidation, our position as a separate company is somewhat obscured, but pay-day comes just as regular.

ERRATIC.

## PERSONALS.

Mr. Kettles, of Boston, has transferred his services to the New England Press Association.

Mr. J. D. Vanderbeek is operator for the W. U. Telegraph Co. and also the N. Y., L. E. & W. R. R., at Passaic, N. J.

Mr. Jas. W. Wilson has recently received the appointment of Manager, W. U. Telegraph Co., Terra Bonne, La., vice Chas. A. Wood, who has resigned the management to accept a better position North.

BOSTON.—The first annual ball and supper of the telegraph operators of the Eastern Railroad will be given Friday evening, March 18, at Monument Hall, Bunker Hill District, Boston. As this

is their initial entertainment, the boys are exerting themselves, and nothing will be left undone that will in any way contribute to make it a most enjoyable occasion. Representatives from State street and the different roads are cordially invited.

Mr. William C. Ellis, for the past four years in the Western Union office at Gardiner, Me., has resigned to accept a position in the banking house of Messrs. G. W. Ballou & Co., at Boston. His departure is greatly regretted by his many friends. For the present his place will be filled by Mr. James Cusick, ticket master and operator in the M. C. passenger depot, with Mr. Henry C. Bates to assist him.

On Thursday evening, Feb. 17, Mr. W. F. Fitzgerald, of the Albany, N. Y., W. U. Office, was married at Schenectady to Miss Annie L. Van Epps, of the latter place. There were upward of fifty relatives and friends present, among them several of the bridegroom's associates in the Albany office. Mr. Fitzgerald is a very popular young man, and received from his fellow operators a substantial token of their regard, in the shape of an elegant French bronze clock and several other individual presents. While the company were partaking of the marriage feast a number of congratulatory telegrams were received from his co-workers at Albany, which were read by the officiating minister, much to the amusement of the guests. Mr. F. believes in consolidation and starts off in his new sphere with the good wishes of a host of friends. His marriage adds to the already large majority of benedicts in the Albany office, which, rumor says, will be still further increased in the spring by two more.

IOWA AND NEBRASKA.—S. C. & P. RAILROAD.—Nebraska has had good sleighing ever since Dec. 20, and trains have been blocked by snow-drifts for two and three days at a time. Mr. M. C. Shields severed his connection with the S. C. & P. R. R. on Dec. 25, to accept the position of private secretary to Mr. Lincoln, of the St. P. & S. C. R. R., with headquarters at Sioux City, Ia. Mr. J. C. Mann, from Altoona, Pa., is now running trains on the Iowa division, while Mr. T. B. Seely, late of the Sioux City office, is train dispatcher on the Nebraska division. Mr. F. D. Kendall is agent and operator at Belle Creek, Nebraska. At Fremont we have Scott Bryan, with "Willie" as assistant. Bob Peyton is agent and operator at Hooper. George Foster is at Scribner; F. A. Harmon at West Point, and Harry A. La Barre at Wisner. The latter is a graduate from the L. V. R. R., at Pittston, Pa. Mr. Avery is at Stanton. At Norfolk Mr. Charles R. Stedman is agent, and Mr. T. E. Bird operator. Both are originally from New York State. Mr. H. D. Dodendorf, from the L. V. R. R., at Fairview, Pa., officiates at Battle Creek. Mr. Joy is at Burnett; P. E. Ritz at Oakdale, and A. P. Fleming agent and operator at Neligh, the end of the road.

## BORN.

WARD.—Feb. 13, 1881, to Mr. G. D. Ward, operator N. C. R. R., Calvert Station, Baltimore, a daughter.

ATKINSON.—Feb. 18, 1881, to Mr. George Atkinson, Manager, Aledo, Ill., a daughter.

FIELDING.—Feb. 14, 1881, to F. S. Fielding, operator, Firth, Neb., a daughter.

## MARRIED.

BARTO—HOLLAND.—At Pittston, Pa., Feb. 16, 1881, by Rev. Father Finnen, Mr. I. N. Barto, chief operator Western Union Telegraph Company at Scranton, Pa., to Miss Annie M. Holland, of Pittston.

FITZGERALD—VAN EPPS.—Feb. 17, 1881, at the residence of the bride's parents, Schenectady, N. Y., by Rev. Wm. E. Griffis, Mr. William F. Fitzgerald, of the W. U. office, Albany, N. Y., to Miss Annie L. Van Epps.

## DIED.

ETTINGER.—Feb. 21, at Harrisburg, Pa., Wm J. Ettinger, Sr., for the past twelve years W. U. lineman at that place, aged 46 years.

162 Fulton Street, New York.

## A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

## Kerite Insulated Wire and Cables

A DIPLOMA FOR

"Excellence of the Insulation and Durability of the Insulator."

OFFICERS:

EDWARD H. SPOONER, President; VERNON SEAMAN, Vice-President; LINDLEY F. SEAMAN, Secretary and Treasurer; THEODORE WILLIAMS, General Agent; W. F. CLEWELL, 58 Broadway, New York, Financial Agent; P. T. NONGUES, 411½ California street, San Francisco, Agent in California; JAMES A. HENNESSY, Superintendent of Mine. PLATT, GERARD & BOWERS, New York, and MOSES G. COBB, San Francisco, Counsel; Register of Transfers in New York: UNION TRUST CO.

Principal Office:

No. 58 Broadway, Rooms 22, 23 and  
24, New York.

This property is situated on the south bank of the Merced river, and comprises 3,000 feet, continuous, on the lode northwest of the well-known and valuable Hite Mine.

The vein is a true fissure, with a general width of from ten to twenty feet, and is undoubtedly a continuation of the Hite vein, from which property some \$5,000,000 has been taken. The main shaft of the Hite Mine is within 10 feet of the south line of the North Hite. The ore assays from a trace of gold to \$1,500 per ton, and an average of \$20 to \$30 may be depended upon.

"Make no Mistake." This Advertisement will not appear again. Don't cut it out. Keep it, and see that the Premiums are all we claim for them. Please mention where you saw this Advertisement.

**WE GIVE THEM AWAY**

**DIAMONDS**

**SUPERSEDED BY THE**

**WONDERFUL NEW DIAMONDS**

**DIAMANTE BRILLIANTS**

**A PRINCELY GIFT!**  
**A GORGEOUS PREMIUM!!**  
**SCIENCE TRIUMPHANT!**  
**DETECTION IMPOSSIBLE!!**

**DIAMANTE BRILLIANTS IN WARRANTED SOLID GOLD SETTINGS**

Diamante Brilliants must not be confounded with the French paste and glass imitations, mounted in cheap gilt or plated settings, with which the country is flooded under the various fancy names given to so-called "imitation diamonds." Diamante Brilliants were exhibited side by side with real diamonds of great value at the Paris Exhibition and were awarded a Prize Medal, and the highest recompense awarded to imitations. They attracted universal admiration, and immediately took the place of, and were intermixed with, costly diamond ornaments, and are now worn at the Court balls and upon all occasions among the best society in London, Paris, and all the capitals of Europe. Diamante Brilliants can be worn at all times, in daylight or gaslight, with perfect confidence and absolute security, as they possess all the brilliancy and penetrating lustre peculiar to real diamonds, and are the only perfect substitute for diamonds of the first water. By their purity and brilliancy they bear comparison with old mine diamonds, and resemble them so closely that detection is almost impossible. They are superior in every respect to real diamonds of inferior quality. The investigations, experiments, and labor of two generations have been expended in bringing these remarkable jewels to their present state of perfection. They are produced chemically by a secret process, known only to the inventors, and they possess all the rare beauty of the gems they counterfeit.

## PRESS OPINIONS OF DIAMANTE BRILLIANTS:

"Their lustre and brilliancy elicit universal admiration."—*Court Journal*.—"Products of perfect purity."—*Journal Society of the Arts*.—"Certainly far nearer in resemblance to real diamonds than anything we have seen."—*The Mechanic*.—"A great achievement."—*Land and Water*.—"The refractive power is equal to real diamonds of the purest water."—*World of Science*.—"They successfully fulfil all the purposes for which real diamonds (even of the first quality) are utilized."—*London Times*.—"Ladies who can afford to wear the real gem will henceforth reserve them for indoors, for since the advent of 'Diamante Brilliants' things are no longer what they seem."—*Boston Saturday Evening Gazette*.

The reputation of Diamante Brilliants is permanently established abroad, and we take great pleasure in bringing them prominently to the notice of Americans. To do so properly requires some nerve and a liberal outlay of capital. These magnificent stones are imported especially for us, and are set in SOLID GOLD, made in Philadelphia to our order, by one of the largest firms engaged in the manufacture of pure gold jewelry in this country. All the stones are set by professional diamond-setters, and as much skill bestowed upon them as with the precious stones. For the purpose of simplifying our business we use but three sizes of the New Diamonds. The Ring, warranted solid gold, one-half karat stone. The Earrings, warranted solid gold, each 1 karat stone. The Stud, warranted solid gold, 2 karat stone. The illustrations give an accurate outline of the style and setting, but no illustration or description can give an idea of their rare beauty. THEY MUST BE SEEN TO BE APPRECIATED. A Ring, same style and quality of setting, but with an inferior stone, has never been sold for less than \$4.00. We can safely say the same of the Stud, and EARRINGS, of inferior quality and style, have never been sold for less than \$6.00. In London, to-day, Diamante Brilliants, same size stone and quality of settings, are selling for three to four times the prices named above, and we believe them well worth \$5 each. So much for their value, as we want this clearly understood.

"What! all this trouble and expense about a Premium for your paper?" Yes, indeed! We can't select a Premium that will please everybody in a day, or a year, perhaps, yet we have expended so much time, thought, and labor on these—we are having the settings made, and the mounting under our own roof almost—we feel emphatically they will make every recipient happy. We are ambitious to give this Post the largest circle of readers of any weekly on the Continent, and we propose to work for it, spend money for it, and use every honorable means to attain our object. This Post is not an experiment; it is the oldest literary and family paper in America—now in its sixtieth year—and our Superb Diamond Premium offers deserve more attention than the many tempting promises of irresponsible parties. This Post is a large, sixteen-page weekly, and aims to interest every member of the home circle. At \$2 a year it is the cheapest paper in existence to-day. This is NOT A CHEAP JEWELRY ADVERTISEMENT. We don't sell Diamante Brilliants; we give them away to Subscribers, and to Club Raisers for the Post.

TERMS:—The Post, one year, and your choice of the Premiums, as a sample, to any address in the United States on receipt of \$2 and nineteen 3-cent stamps prior to April 30, 1881. A club of two subscribers to The Post, one year, accompanied by \$4, entitles the sender to either the Ring, Stud, or Earrings, free. A club of three, one year, and \$6, entitles the sender to any two of the three premiums, free. A club of four, one year, and \$8, entitles the sender to the Ring, Stud, and Earrings, free; or, for \$4, we will extend your subscription two years, and send either Ring, Stud, or Earrings as a premium, free. For \$6, will extend subscription three years, and forward any two of the articles as a premium. For \$8, will extend subscription four years, and send all three premiums, free. All premiums sent by registered mail. Postage on paper and premiums prepaid in every case. Note.—If the premiums are not as represented in every particular, return them at once, and we will return your money promptly. This Post has never missed an issue, and as to our reliability we refer to any bank, express office, or reputable business house in Philadelphia. All premiums will be withdrawn May 1st, 1881.—Size of finger can be obtained by cutting a hole the proper size in a piece of cardboard.—Remittances may be made by F. O. Money Order, Registered Letter, or Bank Draft.—Specimen copy of this Post to any address on receipt of a three-cent stamp. Address,

THE SATURDAY EVENING POST, 726 Sansom Street, Philadelphia, Pa.

# THE DEAF HEAR

BY THE USE OF

# THE PHILLIPS PATENT KEY.

"THE ONLY!"

Price,

\$3.00.

Price,

\$3.00.

Curved or Straight Lever. Sticking Abolished. No Platina Points. Light Lever. Long Leverage.

With eleven years' experience I have been unable to find anything in the telegraph instrument inventions that comes to an operator's relief as this Key has. The one you put in at this office gives great satisfaction to all. The circuits west from here are worked to Cincinnati without repeater, and to Chicago with but one, and in the handling of 70,000 to 90,000 words of specials on these circuits with your key I have the first time to hear the sender or receiver complain of a "stick."

J. A. HUTCHISON, Night Chief American Union office.

To meet the requirements of all, we are making the Phillips Key with both Straight and Curved Levers.

BOX OF HALF-DOZEN EXTRA POINTS, 25 CENTS.

THE

# American Bell Telephone Co.

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly, or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This Company desire to arrange with persons of responsibility for establishing

## DISTRICT OR EXCHANGE SYSTEMS,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as agents, for the purpose of establishing

## PRIVATE LINE

AND

## CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

## SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company, No. 95 Milk street, Boston, Mass.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

Original and only Manufacturers in the U. S. of

**PURE GUTTA-PERCHA GOODS,**

**422, 424, 426**

**EAST TWENTY-FIFTH ST., N. Y.**

ESTABLISHED IN 1847.

## S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description, under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA for Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds.

Submarine Telegraph Cables, 50 varieties, one to ten conductors.

Submarine Telegraph Canal Cables—any number of conductors.

Aerial and Underground Cables of all styles. Hemp armor covered.

Lead-Covered Telegraph Cables, one to seven conductors.

Office Cables, one to seventy-five conductors, gutta-percha and cotton-covered.

G. P. Insulated Wire of all sizes.

Fuse, Leading and Connecting Wires for submarine and mining purposes.

Marks' Compound Office Wires, various sizes, for office, underground, and outdoor use.

G. P. Office Wire, cotton-covered.

Flexible Elevator Cables, any number conductors desired, of every style, and for all purposes.

Compressed Electric Cotton and Linen Double and Triple Covered Cordage any style or pattern.

Burglar Alarm, Call Bell and Annunciator Wires, double cotton wrapped and saturated with any preparation.

Magnet Wires, copper and German-silver, cotton, silk, and fibre covered.

Copper Wires, specially covered for electrical lightning purposes.

Telephone Flexible Cords and Magnet Wires, finest and best manufactured.

## THE AMERICAN POPULAR DICTIONARY:

CONTAINING

Every Useful Word to be found in the English Language.

WITH ITS

TRUE MEANING, DERIVATION, SPELLING AND PRONUNCIATION.

ALSO A VAST AMOUNT OF

ABSOLUTELY NECESSARY INFORMATION

UPON

SCIENCE, MYTHOLOGY, BIOGRAPHY, AMERICAN HISTORY, CONSTITUTIONS, LAWS, LAND TITLES, CITIES, COLLEGES, ARMY AND NAVY, RATE OF MORTALITY, GROWTH OF CITIES, INSOLVENT AND ASSIGNMENT LAWS, DEBTS, RATE OF INTEREST, AND OTHER USEFUL KNOWLEDGE.

BEING A

## PERFECT LIBRARY OF REFERENCE, IN ONE HANDY VOLUME.

510 PAGES. STRONGLY BOUND IN CLOTH. PRICE ONLY \$1.

The publisher of the AMERICAN POPULAR DICTIONARY claims for it the support of telegraphers and the public, for the following among other reasons:

It contains every word of the English language that enters into speech or writing.

The Spelling of each word is that given by the best authorities.

The Definitions are compiled from a majority of the best writers of the English language.

The Pronunciation of every word is that settled upon by the ablest scholars.

In addition to the perfections of this work as a Dictionary, it contains a vast amount of information upon many kinds of useful information not to be found in any similar work; but all absolutely necessary to every one who wishes to be acquainted with the leading subjects of conversation and composition.

TELEGRAPHERS, more than any other class of men, need a good and handy Dictionary in their office at all times. There is no Dictionary published that will give them better satisfaction than The American Popular.

Dictionaries printed in England are of little use in this country, where many words are differently spelled, and the meaning not always the same. Send for the American Popular Dictionary, and get the best Dictionary at the price published.

The American Popular Dictionary is printed from new type, with extra clear and legible face, and handsomely bound in cloth and gilt. From it a speaker or writer can glean an amount of knowledge impossible to find elsewhere collected in one book.

Worth ten times the price.—N. Y. Times.

A perfect dictionary and library of reference.—Leslie's Illus. News, N. Y.

We have never seen its equal, either in price, finish or contents.—Chris. Advocate.

Copies promptly mailed, postage prepaid, on receipt of price, \$1, in currency or postage stamps, or by Post Office order. Liberal discount to agents.

Four copies by mail or express, prepaid, \$3.00.

THE OPERATOR for fifteen months and the Dictionary, only \$2.00.

### The Consolidation Goes Sweeping on—The Cable Companies Nonsuited.

The readers of THE OPERATOR are already familiar with the fact that, on the 16th of February, the Direct United States Cable Company filed a bill against the Atlantic & Pacific Telegraph Company and other companies, praying for a perpetual injunction to restrain the consolidation. Judge Porter, in his argument, presented the case in this light:

The cable companies have gone into a pool, which is unlawful under the laws of the State of New York, and, at least, of doubtful legality in England; and they ask Your Honor to enforce, in our State, as a matter of comity in favor of one of the members of a pooling agreement, a contract which had been made with some of those members, and, as it turns out, for the benefit of the pooling company, and to the detriment of our own corporations, and in defiance of our own laws. Can there be any doubt that the pooling agreement was illegal? The cable companies have a monopoly; they have established it through the pool. That is a pool which, if they were organized under our laws, would subject them to indictment for a conspiracy, or to a revocation of their charter. A man is free to buy what he will. Messrs. A. T. Stewart & Co. may buy out Claflin & Co.; both may buy out any dozen firms that they please in the city of New York, and they may run all the stores. That is the monopoly of private property. But if Stewart & Co. and Claflin & Co. and these others, without purchase and without sale, enter into a combination, that is an unlawful combination. The cable companies have done that. What they did they did without authority of law, and it is against public policy. The Direct Cable Company is a member of the pool, and whether it does or does not transmit messages it receives a portion of the earnings of the pool. Plaintiffs' counsel say that the Atlantic & Pacific Company agreed to live for twenty years. It did not. The cable company took with knowledge that they might sell the next day the property right from under that agreement, under the act of 1870. There is no allegation of the insolvency of either company. They say if they recover a judgment they cannot collect it. Why, they were never in as good a condition to collect it. There never has been a time until its connection with the Western Union Telegraph Company when it made money at all; it was doing a losing business.

Argument was continued from time to time until the 1st inst., when Judge Blatchford reserved his decision until argument in the suit brought by the French Cable Company, asking for a similar injunction, should be concluded.

On the 3d inst. the court flatly refused to issue the injunctions asked for by the cable companies. An amended order was then presented by the complainant companies, but only to meet with a similar fate. The court also refused any postponements for the purpose of reviving litigation. The drift of Judge Blatchford's decision was contained in a single sentence, which said that "to compel the stockholders of the selling companies, when their sale is authorized by law, to forego the benefits of a sale valuable to them and to submit longer to the sacrifices and ex-

penses of a business less advantageous to them than the sale, is to put the power of a court of equity and the province of an injunction to uses which are not warranted by reason of a precedent."

In "the Williams suit" the case rather went the other way. This was a case where, as will be remembered by readers of THE OPERATOR, Mr. William S. Williams sued, in the Superior Court, the Western Union Telegraph Company and the Union Trust Company to enjoin the distribution of the scrip of the increased \$15,526,590 capital stock of the former company among the stockholders, and also to prevent the proposed purchase of the Atlantic & Pacific and the American Union Telegraph properties for \$23,000,000, Mr. Williams claiming that both together were worth only \$8,000,000. The application was originally made to Judge Truax, who, on February 12, granted a temporary injunction, and ordered an argument to be had to decide as to its being made perpetual. On the 28th ult., Chief Justice Sedgwick, before whom the last argument was had, granted an injunction preventing the proposed distribution of \$15,526,590 increased stock among the Western Union stockholders, at the same time holding that on the other question raised there was not sufficient evidence to warrant an injunction. The order was as follows:

It is ordered that the defendant, the Western Union Telegraph Company, and the individual defendants, its directors and officers and their and each of their employes, officers, agents, servants, attorneys and counsel, be and they are hereby restrained and commanded to refrain from issuing, transferring or dividing among the stockholders of the Western Union Telegraph Company any part of the sum, \$15,526,590, of the increased capital stock of the said Western Union Telegraph Company as provided in a certain contract made between the directors of said Western Union Telegraph Company and the American Union Telegraph Company and the Atlantic and Pacific Telegraph Company, or in any other manner, to said Western Union Telegraph Company during the pendency of said action or until the further order of the Court. And it is further ordered that the defendant, the Union Trust Company, its directors, officers, agents, servants, attorneys and counsel, refrain from issuing to the stockholders of said Western Union Telegraph Company any portion of said stock during the pendency of this action or until the further order of this Court. And it is further ordered that the motion made to continue the order of the Hon. C. J. Truax in other respects be denied.

Dr. Norvin Green, when questioned, said that this decision would not prevent the issue of stock for the purchase of the properties of the American Union and the Atlantic & Pacific companies, but only the equitable distribution of stock to the Western Union stockholders; that it would not change the situation, except so far as the Western Union stockholders are effected. The telegraph consolidation is a fixed fact, but

this decision may require that new means be devised to effect the equitable division of new stock among the Western Union stockholders, instead of those provided by the January agreement. He could not say what would be the next legal step which his company would take.

The Postal Telegraph scheme has not been heard from since our last issue, and seems to have been effectually shelved.

The "anti-monopolists" have apparently retired from the field, and, for the matter of that, we have heard very few expressions of regret. Mr. Vanderbilt was recently questioned on this particular point, and replied as follows:

"It is perfectly absurd—this cry of anti-monopoly. Agitators and demagogues always begin by attacking property; they know they cannot succeed unless they set up a popular cry which presents a false issue. The present mode of attack is to call all the great corporations monopolies, and the railroads are selected as the chief offenders. Now, as a matter of fact (and here Mr. Vanderbilt's voice grew almost vehement in its earnestness), the railroads have done more than all other agencies to develop the country; a larger percentage of the money invested in them has been sunk than in any other business, the capitalist who first embarked in the enterprise generally losing his money and the people getting the roads. Moreover, consider that never in the history of the country has there been so much railroad building in competition with old lines as there is to-day. A monopoly is simply impossible. There is too much money and enterprise in the country for that, and railroads are too easily duplicated."

It will thus be seen that the consolidation goes on, one way or the other, and if the public feels that it needs relief it must drop the anti-American plan of appealing to the State courts and the general government and, in lieu thereof, put its money in new lines and let us have a live opposition. The trade is free to all.

### Notes and Queries on Electricity and Electromagnetism and their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

BY T. D. LOCKWOOD.

Q. 94. What is thermo-electricity?

A. Thermo-electricity is the name given to that branch of the science of electricity which relates to the production of electric currents by the agency of heat. The term literally means heat-derived electricity.

Professor Seebeck, of Berlin, in 1823, discovered that if two bars of any two metals, especially bismuth and antimony be soldered together at one end, and have their other ends connected to one another by a wire, so as to form a complete circuit, on the application of heat to the point where the metals are soldered

a portion of the applied heat is absorbed and disappears, and an electric current is developed in its stead.

All metals, and many other conductors of electricity, are capable of producing thermo-electric currents, and they are all classed either as thermo-electro-positive or thermo-electro-negative bodies. The former class comprises those conductors in which the current proceeds from the colder to the warmer portion; and the latter includes those in which the current proceeds in the opposite direction.

Bismuth may be regarded as the representative of the former class, and antimony as that of the latter. In experiments in this science, therefore, these metals are most frequently used. For example: We take a bar of bismuth, and solder or braze one end of it to one end of a bar of antimony, then attach a galvanometer by wires to the free ends of the two bars, so that the circuit is completed from the bismuth to the antimony by soldering; then from the other end of the antimony to one terminal of the galvanometer, and from the other terminal of the galvanometer to the free end of the bismuth. If we then heat the junction of the two bars, we shall see the needle deflect, the current proceeding from the bismuth through the heated point to the antimony, thence through the galvanometer and back to the bismuth. Some metals when thus united are found to produce a current in one direction when the junction is moderately heated, but when the heat is increased, the direction of the current is reversed.

Q. 95. What is a thermo-electric battery?

A. When only one bar of each of the metals employed is used, the arrangement is called a thermo-electric pair. A number of these thermo-electric pairs may be joined in series, just as a number of voltaic cells are joined together for the formation of a voltaic battery.

When the pairs are so joined, the entire series is called a "thermo-electric battery," and its electromotive force is equal to the sum of the electromotive forces of all the pairs added together. To make such a battery, suppose we have six bars of bismuth and the same number of antimony, each bar being three inches long, three-quarters of an inch wide, and one-fourth of an inch thick. Arrange them alternately, so that if the first bar is bismuth the last will be antimony. The bars must then be soldered together at each end, the second, antimony, being, for instance, at one end soldered to the first bar and at the other end soldered to the third; the third, in its turn, having its other end soldered to the fourth, and so on. The two terminal bars will, of course, have one end unattached.

These free ends represent the poles of the battery. To set the battery in operation, all the junctions on one side must be heated, while all those on the other side must be kept cold. While the arrangement described represents the principle of the thermo-electric, there are many varieties, modifications and improvements. One of the first thermo batteries was invented by Melloni, in 1834. He made what he called a thermo-multiplier. It consisted of about fifty little bars of antimony and bismuth inclosed in a brass cylinder; the whole arrangement being but two and a half inches long, and about half an inch in diameter.

The terminal bars were connected by wires to a delicate galvanometer. This contrivance was so sensitive to slight changes in temperature that when the hand was brought near to one end of the instrument the current generated was sufficient to move the needle several degrees. Two of the most efficient thermo-electric batteries are those of Nöe, of Vienna, and Clamond, of Paris; the former being more speedily excited and giving a powerful current, and the latter being very strongly constructed. To sum up: A thermo-electric battery may be briefly defined as "an arrangement which transforms heat into electricity."

Q. 96. Has the thermo-electric battery ever been employed for practical purposes?

A. Yes; it has been applied to several purposes. Melloni, at a very early date, used the thermo-pile, previously described as having been constructed by him, to measure small differences in temperature. Clamond's battery has been quite extensively experimented with in England for working telegraph circuits. It was expected that the thermo-electric pile, in Clamond's improved form, would, on account of its low resistance, be useful as a universal battery—that is, one from which many circuits are worked; and at one time five thermo batteries were used to work no less than 90 separate circuits from the London post-office. Each of these circuits were less than 100 miles in length. All the thermo batteries, however, ultimately failed, by the burning out of the insulating material between the several layers of bars. This is probably not a fault which will prevent the thermo-pile from being eventually used.

But the most important application of the thermo-electric battery has hitherto been to furnish a current for the electro-deposition of metals, or, to use more familiar terms, for electro-plating. It was first so used in 1843 by Moses Poole, and patented, but did not then come into general use.

Thermo-electricity has, however, been more or less employed since that time for plating, and since the invention of Clamond, has done efficient work. Clamond's thermo-electric battery is now in use in various plating establishments in Birmingham, London and Sheffield, and it is said that a machine of one hundred bars, with a consumption of eight to nine feet of gas, deposits an ounce of silver per hour.

These batteries have experienced such important improvements of late years that it is believed they will soon be utilized with great advantage.

Q. 97. What is magneto-electricity?

A. It is the name given to electrical currents developed by the relative movements of magnets and wires. For example, if a magnet and a coil of insulated wire are caused to alternately approach and recede from each other rapidly, momentary currents are induced in the coil, which are alternately opposed to each other in direction. The process of developing magneto-electricity as already stated (see answer 12), is called magneto-electric induction.

It is one of Faraday's most important discoveries. While experimenting, in the year 1831, he ascertained that by inserting the end of a permanent magnet into the middle of a coil of wire to which no battery was attached, a current of electricity was produced, whose direction depended upon the pole of the magnet inserted and the direction in which the coil was wound. By inserting the other end of the magnet a current in the opposite direction was produced.

In the same year he produced a spark by pulling an armature (covered with a coil of insulated wire) from the poles of a magnet; and also obtained magneto-electric currents by rotating a copper plate between the poles of a magnet, and by sliding a coil of insulated copper wire upon a bar magnet. We see, therefore, that by the mere motion of a magnet in near proximity to a conductor, or of a conductor in the immediate vicinity of a magnet, without any battery, dynamic electricity may be produced. In the next year, 1832, the first magneto machine was invented, and electricity generated in this manner is now one of the most important agents in the useful arts, and is for many purposes to be preferred to that produced by voltaic batteries.

Q. 98. What are the principal applications of magneto-electricity?

A. It has been quite extensively applied in many ways too numerous to recapitulate. The following are, however, a few of its most important applications:

Magneto currents, generated by small machines are frequently used for medical purposes, and have also been much employed in the experimental room and laboratory for chemical and physiological reactions.

It is also almost universally used in the production of the electric light, and was first employed for that object by a Mr. Holmes, who showed a machine for the purpose in the International Exhibition of 1862, since which time, whenever the electric light has been used profitably, its currents have been generated by magneto machines.

For blasting, the explosion of mines and

submarine charges, it has proved a very valuable agent, Prof. Wheatstone having devised an ingenious apparatus for the exploding of fuses. It has the power of igniting from two to twenty-five fuses simultaneously.

The application of magneto-electricity to electro-plating was an event of importance in the history of that art. It was first so applied in 1842, and the machine then introduced was used for many years, but has now been superseded by newer and more improved arrangements, such as the Gramme or Siemens, and Alteneck machines.

Perhaps, however, the most important application of magneto-electricity is to telegraphy. Gauss and Weber, in 1833, moved their telegraph needle by magneto-electricity, which was the first employment of Faraday's discovery in such service.

Subsequently Steinheil, in 1837, and Wheatstone, in 1840, made great improvements in apparatus; and at the present time Wheatstone's alphabetical telegraph is almost exclusively employed on country lines in England, while the magneto-pointer telegraph of Siemens and Halske holds its own as a private line instrument in Russia and Germany. In our own country, the magneto-pointers of G. L. Anders are well and favorably known.

The magneto current has been more extensively employed during the last few years than ever before, owing to the extraordinary number of magneto bells manufactured and introduced as telephone signals. The telephone itself is also an important application of magneto-electricity, which will be more fully considered hereafter. Very lately magneto-electricity generated by dynamo-machines has by Stephen D. Field been applied as a continuous current to the closed circuit Morse wires of the Western Union Telegraph Company.

Q. 99. Has the magneto-electric system of developing electricity any advantages over the voltaic battery method? If so, describe some of them.

A. For some purposes it has decided advantages, some of which may be enumerated as follows:

On comparatively short telegraph lines, such as private and municipal telegraphs, it is far superior to the battery system, inasmuch as although the first cost of the machine is greater, there is practically no outlay for its management and maintenance, while the expense and annoyance inseparable from the maintenance of batteries are totally dispensed with.

It has also been ascertained in the practical working of magneto telegraphs that they will work satisfactorily over a heavy escape that renders a line worked by batteries totally inoperative.

In the production of the electric light, the magnet machine presents great advantages as compared to voltaic batteries, on the score of economy and convenience. It has also been the most valuable agent in bringing the cost of the light within reasonable limits.

The chief objection to the use of the electric light was formerly the enormous expense necessarily contingent on the continued use of large voltaic batteries, and the consumption of zinc and other materials essential to keep them in good working order.

The introduction of the magneto-machine, in 1862, by Mr. T. Holmes, and the wonderful improvements that have since been effected by Wilde, Siemens, Wheatstone, Ladd, Gramme, and others, has completely obviated this objection, and made the electric light an ordinary illuminator, known and valued by many, instead of being, as formerly, a cabinet curiosity, only within the grasp of the professional electrician.

These machines have also, with excellent results, been applied to electro-plating, and for that service are now being universally preferred to batteries, the same advantages being observed as in their application to lighting. The Gramme machine was first used for this purpose, and the first one made ran for five years without any repairs or outlay, except the cost of oil for lubrication.

But since the general introduction of the telephone, magneto-electricity may be said to have found its sphere. Merely mentioning the telephone itself, in which the magneto currents may be said to be involuntarily generated, it was early seen that some signal was necessary to at-

tract the attention of the distant telephone operator; and the application, in a branch circuit, of the magneto-electric generative apparatus, in combination with the special polarized armature invented by Thomas A. Watson, answered the purpose so admirably that it is still used substantially in the same manner as at first.

Many thousands of these bells are now in use, and will be fully described in their place. The use of the magneto bell for a signal has also the advantage of being able to ring over long or short lines indifferently, and in large offices the economy in maintenance, and the valuable space saved, which would otherwise be devoted to large batteries, is such a consideration as to render the magneto system the only one now regarded as worth a second thought.

### THE ASSOCIATED PRESS.

#### An Entertaining and Instructive Lecture by the Director-in-chief.

On Thursday evening last, the 10th inst., Mr. James W. Simonton, the General Agent of the New York Associated Press, delivered a lecture at the Academy of Music, Philadelphia, choosing a subject particularly interesting to all telegraphers, viz.: "The Associated Press, or How we Get our News." The Academy, which is the largest theatre on the continent, was well filled by a highly critical and cultured audience, many of the clergy, judges, professors from the University of Pennsylvania and the leading merchants being accommodated with seats on the stage. At a table to the left of the distinguished orator was a Morse instrument, and, at intervals during the evening, messages were exchanged between the audience and London, New Orleans, San Francisco, and Montreal. This part of the programme was superintended by Mr. W. H. C. Hargrave, the local agent of the Associated Press at Philadelphia, who is also a well-known and expert operator. Under his personal supervision, and with the aid of Mr. Frank W. Jones, of the Western Union; Mr. G. G. Ward, of the Direct Cable, Messrs. George Merrihew, and Thomas Dolan, night managers respectively at Philadelphia and New York, and other courteous officials, the circuit changes—Torbay at one time and San Francisco direct at another—were made with such rapidity as to astonish even experienced telegraphers, while the admirable working of these long circuits, one of them at least stretching over 3,400 miles, and duplexed, and the other half way to England, reflected the greatest credit on the telegraphic system of the country, and the skill and enterprise of its managers. Under this head we should not omit the name of Mr. Wilfred N. Gove, the operator, who handled his wires in his own inimitable style. With telegraphers Mr. Gove needs no commendation, and it is sufficient to say that the great success of that part of the lecture was due in no small measure to his usual coolness, discretion and well known ability as an operator.

The orator was introduced by Mr. William V. McKean, the editor of the Philadelphia *Ledger*, who spoke of him as "the greatest wire-puller of the age." Mr. Simonton at once, and with his usual vigor, struck into his theme, of which the following is a synopsis:

The name of the Associated Press is familiar, but of its character and purposes the general public is largely ignorant, and it is questionable whether there is any other subject, the telegraph itself excepted, so intimately connected with the everyday affairs of the people about which the people know so exceedingly little. Having traced the growth of the Associated Press from the year 1837, when the procurement of marine news in New York harbor led a number of journals in that city to combine, down to the present day, Mr. Simonton explained that the organization is practically a central news exchange, with branch associations for local purposes in various cities, all governed by the same object, of getting the

most and freshest news, while the cost of distribution is divided among all the members.

The mode in which the association, which is not an incorporated organization, is managed and operated was explained by the speaker, together with the territory covered by the branch associations, which collect the news within their respective territories and forward it to New York, whence it is redistributed all over the country among the 80 voting members and more than 100 customers not members. Having in this way shown how the co-operative business of exchanging news is carried on, Mr. Simonton described the manner in which the branch press associations are governed, showing that the associations in the large cities bear the brunt of the pecuniary burden.

The cable facilities were next spoken of. By this means, said the speaker, not only the news from the Old World is placed before readers every morning to read at their breakfast tables, but the comments of the papers of the Old World are also laid before the readers, as fresh as their breakfast rolls. A description of the method by which twenty-six copies of a report are made simultaneously by means of impression paper and the stylus, followed, together with the mode of distributing the reports to the papers. Mr. Simonton then said: "Ladies and gentlemen, I will now give you an illustration of how we get the news. I shall send from this spot several genuine messages to various cities, and give you the answers as soon as they are received. I have notified the operators at these points that I should be apt to call them about this time, and there will probably be but little delay."

Turning to Mr. Gove, Mr. Simonton said: "Call up New Orleans. Send McDaniel 'How are you? What is the news in New Orleans to-night?'" In two or three minutes the answer was clicked back, and read in full by the lecturer.

At five minutes to nine P. M. Mr. Simonton requested the operator to call up London and send the following message: "To Heuston, London. What is the news in your city? What is Parliament doing to-night?" In three minutes the answer was handed him, and after he read off news that had been flashed like thought under the ocean, the audience applauded very cordially. Mr. Simonton added that it had come by way of the Direct United States Cable.

While awaiting the reply to the dispatch from London, the speaker related several anecdotes illustrative of the blunders made in sending dispatches, and the relation of one of them drew out evidence of the fact that the audience was composed of people who keep the run of news. He was beginning to tell of an incident in which the mistake of a single letter caused the friends of a youthful bride and groom to be met solemnly on their arrival at the depot by friends with a hearse and carriage, instead of a horse and carriage. Mr. Simonton had got as far as "a young married couple on their bridal tour," when the house came down with a round of hearty applause, a delicate compliment to the speaker's recent marriage.

At six minutes after nine o'clock, San Francisco was called up, and across the continent was flashed the query: "Webster, San Francisco, 'What is going on in your place. Give us a dispatch, quick.'" In six minutes the replies were read, referring to the Kalloch case and to the success of the Moody and Sankey meetings. In this connection, the lecturer explained how the news as it was being sent was "dropped" at Chicago and other cities for the use of the press in those places.

The average cost to the members of the Associated Press for the news distributed to them was next spoken of, ranging from \$15 a week to some small struggling paper in the South to an average of \$300, and higher, per week, in the largest cities.

The charge that the Associated Press is a monopoly was taken by the speaker for a brief review and answer. He explained that there is no more combination between the telegraph company and the Associated Press than there is between the bank and its depositor. The association gets the lower rates that belong to large orders, but no advantage that cannot be obtained by any one else that will give the telegraph so much business. The speaker referred adversely to the demand for government telegraphy, after which Washington was called up. "Ask how the

weather is?" said Mr. Simonton. Almost instantly the answer came, "Moonlight, cool and pleasant."

Mr. Simonton then asked for a news dispatch from Washington, and while awaiting its transmission improved the opportunity to explain that the Associated Press is not a monopoly because it decides who shall and who shall not have the use of its news. "One man can photograph the rising sun," remarked the lecturer, "and there is no reason why a thousand may not do the same thing if they will get up early enough in the morning." (Laughter.) He decried as groundless and senseless the clamor against the Associated Press as a monopoly.

At this juncture there came an intelligent summary of the latest Washington news, from Mr. Walter P. Phillips, the agent at that city. When Mr. Simonton ordered the operator to ask Washington the time there was a general reference to timekeepers in the audience, and some were scarcely in hand when the operator announced "Nine twenty-two."

Mr. Simonton then spoke of the personnel of the Associated Press, paying a high tribute to their intelligence, culture and fidelity. He ridiculed the idea that Jay Gould or any other individuals could, even if they so desired, control the Associated Press. In conclusion, Mr. Simonton spoke of the blessing the association had proved itself as a mighty force in civilization, referred to the prodigious labors connected with the reception and handling of the news, and gracefully closed his lecture by introducing a picture of the weary news editor receiving from the Associated Press agents, about three o'clock in the morning, the mysterious telegraphic symbol "30"—the welcome sign that his weary task had ended for the day. He pictured the faithful operators passing on the welcome word, flashing over vast plains and through mountain glens, under the billows, from North, South, East and West, the good word that marks the end of another day of toil, and its simple meaning is, "GOOD NIGHT."

### Operators and Actors.

In the good old days of the American Telegraph Company, operators and actors were more closely allied than they are to-day. "Red tape" was comparatively unknown, and the word "telegraph" was a talisman which commanded the open sesame to any theatre.

The humblest tyro in telegraphy in those days could "D. H." a social message for a histrionic friend, and in return passes to witness tragedy, comedy or pantomime were always forthcoming.

Among others who have enacted upon the stage the dual professions of telegrapher and actor may be mentioned the late Robert Heller, magician. Mr. Heller found in electricity a valuable factor in the production of many of his wonderful and mysterious performances. Electricity was evidently employed in the "second sight" manifestations, and his remarkable thunder and lightning scenes could not have been performed without its aid.

In Dion Boucicault's "Long Strike," the telegraph office furnishes a scene which, if properly placed upon the stage, is quite as thrilling and sensational as could be devised.

J. Ed. Milliken, brother of Geo. F. Milliken, manager of the Western Union office at Boston, is an excellent stock actor, and has lately adopted the stage as a vocation. Mr. Milliken is admitted to be one of the best electricians in the Union. He is the inventor of the Milliken repeater, the Milliken spring jack switch, the Milliken compound wire and the quadruplex operating table, universally used by telegraph companies. He, however, has profited very little from these inventions, having neglected to take out patents. M. C. Milliken, a brother, is an organist and composer well known in New England.

Wm. Martin, receiver at the Western Union Boston office, has frequently appeared upon the

stage of the Boston Museum on benefit nights. Mr. Martin studied for the stage, and is a natural actor, as his friends can testify, but abandoned his chosen profession at the solicitation of a member of his family.

Mr. Martin's mother, Mrs. Sarah Martin, whose death at the age of 80 is recorded in the present issue of THE OPERATOR, was well known in musical circles half a century ago, under her maiden name of Bennett. At one time her services commanded a greater price than those of any other vocalist in Boston.

Wm. H. Fessenden, an operator, and until recently secretary to Assistant General Superintendent Chas. F. Wood, is one of the finest of American tenors, and has performed leading parts at Booth's Theatre in this city, with the Boston Ideal Opera Company.

Fred Seibert, formerly of the Western Union office, this city, is stage manager of one of Brooklyn's amateur dramatic associations.

C. G. Craig, now "on the road" as stage manager for Charlotte Thompson, is destined to occupy a creditable position on the mimic stage. His parts are leading heavies and juveniles. This gentleman has supported Edwin Booth upon several occasions, and possesses the requirements of a popular actor, being tall, well formed, with an excellent voice and easy self-possession.

Chas. H. H. Cottrell, now with the Associated Press in Washington, occupied for some years in England a literary position with the Lydia Thompson Burlesque Troupe, and subsequently in this city collaborated with Mr. Edward Harrigan the sketch familiarly known as the Mulligan Guards.

Actors are famous for liberality toward deserving brethren or sisters who are debarred from earning a livelihood before the footlights, and innumerable instances could be recounted of the sympathy shown members of their order temporarily strangers in a strange land.

This fraternal freemasonry is also characteristic of telegraphers; they, like actors, are connected by social ties—not always engendered by personal communion, as actors' are, but often through the not less potent medium of the wires.

#### Completing the Organization.

The third meeting of the New York Electrical Society, on Wednesday evening, March 2, was called to order at 8 o'clock by President F. W. Jones. After the reading of the minutes the election of the four members of the Executive Committee was proceeded with. After considerable balloting, Messrs. C. S. H. Small, G. L. Wylie, E. C. Cockey and E. A. Leslie were declared elected. Mr. Brick having resigned the office of Treasurer, on account of some intimations made to him that the manner of his election at the previous meeting was not strictly fair and proper, balloting for treasurer was the next business in order, the result being the re-election of Mr. Brick. The letters of regret spoken of in our report of the last meeting were read, and on motion ordered to be placed on file. On motion, the Executive Committee was instructed to look out for a place of meeting and report at the next meeting, to be held at the same place, the United States Hotel, to-morrow evening, March 16, at half-past seven o'clock.

Notice was given that the evening now set for meeting nights, namely, Wednesday, was found to conflict with engagements previously made by several members whom it would be desirable to have present, and that to-morrow night the

question of substituting another evening in place of Wednesday would come before the meeting for action.

During the evening a large number of names were added to the list of members, it being decided that all names entered up to that evening should be considered charter members. Many of those present also paid the initiation fee, \$1.00, and the dues for the first quarter, 75c. The meeting adjourned at 10:30. We understand that since last meeting an exceedingly generous offer has been made the society by Mr. Hewitt, of the Cooper Union, in reference to furnishing a room for the meetings practically free of expense. The membership of the society is already about 200. The following names have been added in addition to those already published:

James Hamblet, R. H. Morris, Charles S. H. Small, Michael Breslin, Richmond Smith, Edward M. Anson, Henry Rothenich, J. H. Young, George W. E. Atkins, W. R. Warren, D. H. Bates, A. R. Brewer, Clayton S. Fitch, D. B. Mitchell, Ralph W. Pope, James W. Simonton, C. E. Chinnock, J. B. Van Every, H. L. Storke, Clarence Carey, C. L. Buckingham, W. B. Van Size, A. Beatty, W. B. Sheldon, J. J. McKenzie, Geo. E. Hinman, Geo. M. Phelps, R. Waycott, Wm. F. Widmayer, Daniel M. Adey, W. R. Pope, Wm. W. Shanon, A. K. Thompson, J. F. Donnelly, H. F. Ogden, A. D. Brooks, J. F. Toole, Wm. W. Wight, Irving S. Fitch, E. O. Alyea, G. L. Wiley, I. M. Taylor, J. R. Mix, J. Hemmens, R. C. Malloy, A. E. Robinson, J. M. Foster, G. D. Farwell, Jabez Fearey, F. F. Fearey, E. Willet Smith, Fred D. Marsh, Edmond Hoffman, J. H. Longstreet, C. M. Fulton, John Van Horne, A. D. Thompson, Barclay Gallagher, Willis H. Jones, A. B. Chandler, F. L. Pope, L. G. Tillotson, J. R. Wiley, Samuel L. Taylor, B. M. Plumb, J. F. Noonan, T. G. Ellsworth, A. McDonald, A. P. Martin, J. F. Reynolds, A. H. Dingler, R. D. Riley, A. Voyer, M. J. Doran, J. K. Knight, H. E. Robson, I. A. Sherman, T. F. Taylor, R. S. Keith, O. K. Newton, John Simmonds, Ignatius L. Byrne, Samuel L. Nash, G. B. Hubbell, W. E. Sawyer, T. D. Lockwood, D. H. Craig, Theo. Larbig, Norvin Green, H. J. Merriman.

#### Western Union Quarterly Meeting.

The usual quarterly meeting of the directors of the Western Union Telegraph Company—the first regular quarterly meeting since the consolidation—was held at the executive offices of the company, in this city, on Wednesday, March 9, and a dividend of  $1\frac{1}{2}$  per cent. declared on the capital stock of the company out of the net revenues of the quarter, payable on April 15, to stockholders of record on March 26. Interest of  $1\frac{1}{2}$  per cent. was declared on the certificates of indebtedness of the company which may not have been converted into stock issued for the American Union and the Atlantic and Pacific purchases and to the old stockholders of the Western Union to the amount of about 48 per cent. The transfer books of the company were opened on the same day for the exchange of new stock for the A. & P. and American Union certificates of indebtedness, and for the A. & P. stock formerly held in the Western Union treasury, but distributed among the stockholders under the terms of the telegraph consolidation. The new stock intended for the Western Union stockholders, the issue of which was restrained by the injunction of the courts in the Williams suit, is represented to them by certificates of indebtedness which do not possess voting power, but which receive interest at the same rate as the company's dividends.

The quarterly report of the executive committee for the quarter ending Dec. 31, 1880, shows that the actual net profits were \$1,026,556, or \$74,749 more than the estimate made at the last meeting on Dec. 8. The following revised statements, based upon complete returns, will show the condition of the company at the close of the

quarter ended Dec. 31, 1880, as compared with the corresponding quarter of 1879:

	1879.	1880.
Surplus Oct. 1, as per last quarterly report.....	\$1,143,873	\$193,130
Net profits, quarter ended Dec. 31....	1,529,169	1,026,556
	\$2,673,043	\$1,224,686
From which deducting:		
Dividend of $1\frac{1}{2}$ per cent., paid Jan. 15, 1881.....	\$1,127,596	\$615,061
Interest on bonded debt..	107,425	106,687
Sinking fund appropriations.....	20,000	20,000
Construction account.....	256,468	327,276
Purchase of telegraph stocks and patents..	53,624	7,395
	1,565,115	1,076,400
Leaves a surplus Jan. 1 of.	\$1,107,927	\$148,285

\* In 1879, the quarterly dividend was  $1\frac{1}{4}$  per cent., and an extra dividend of 1 per cent. was also paid.

In the estimates for the quarter ending March 31, 1881, the sum required before the consolidation to meet the claims of the Atlantic & Pacific Telegraph Company, which amounted to about  $12\frac{1}{2}$  per cent. of the gross earnings of the Western Union Company, is excluded. The net revenues for the quarter ending March 31, inst., based upon official returns for January, nearly complete returns for February, and estimating the business for March, is put down at about \$1,669,173.

#### Edison and the Electric Light.

To the Editor of The Operator:

SIR: In view of the recent successful researches of Dr. Maxim, and the electric light's nearer approach to perfection, I deem it necessary that something should be said or done in order to guard the world from erroneously giving credit in this matter where it is not due. As an example I might mention the case of the telephone, where not until two years after the introduction of Bell's instrument, did Mr. Edison patent his first articulate telephone transmitter. Yet to this very day Edison's name in telephony is to many people what Elias Howe's is in regard to the sewing machine.

I do not mean for an instant that Edison is not justified in claiming originality for his molecular telephonic transmitter, but I do say that it was not shown to the world until two years after the invention of Professor Bell. In furtherance of this view, it is my intention to show how little Mr. Edison has done in the field of electric lighting, and to show further how much he claims and gets credit for that justly belongs to others; for, to grant him all that he and his many admirers claim, would be doing a gross injustice to that great army of inventors now working for the same end.

To be brief in the description of the Edison light, I need only say that it is a combination of three things, namely: Starr's lamp, Siemens' generator and Faraday's principle of subdivision of electric currents. All these things are certainly original, but, unfortunately, not with the "Wizard of Menlo Park." Because he should give these the name "Edison Electric Light," is no reason why they are such. Mr. Edison has already said that Hughes' microphone was an infringement upon his carbon molecular telephonic transmitter.

With Siemens' generator you are acquainted, as also with Faraday's (or modernized as Edison's) subdivision of current. In so far as the lamp is concerned, suffice it to say that it was invented years ago, and at a time when dynamo machines as a source of supplying electricity were unknown to the world. Mr. Starr saw at that time that it was impossible by means of a current obtained from chemical decomposition to supply an electric light to compete with gas, and accordingly abandoned the idea. Shortly afterward the inventor died, and nothing more was heard of the lamp until Siemens, of Europe, gave us the benefit of his dynamo machine. Then Edison adopts the old lamp and supplies it with a current obtained from a generator. This is the Edison light.

I fail to see why Edison should receive any commendation for this. If he had done anything toward further perfection of the lamp or system of lighting, praise might be due him, but further than that he has done nothing, except to combine these three things under one title and make announcements that he was going to do this or that, and show statistics which were based on the principle that if  $x$  equals nothing  $10x$  equals 20, as every person knows who has read anything about it.

Dr. Maxim, unlike Edison, took up the same lamp; but the difference that characterized the labors of these two men was that while Mr. Edison took it as is was, and tried to make us believe it was his own, Dr. Maxim improved its condition by introducing an entirely new principle, namely, the substitution of gasoline vapor where the vacuum was formerly used, thus making it, by the chemical action of the gas, a perpetual lamp.

I do not care to argue the case, as it is not necessary in order to show that Edison has no more, and not as much, claim on the light than he has on the telephone. But I simply desire to state that there is no such thing as Edison's light. That term is a misnomer. It should be "Siemens', Farraday's and Starrs' light."

W. EASTERN.

NEW YORK, Feb. 18, 1881.

### Chicago Notes.

To the Editor of The Operator:

SIR: The seventh annual reception and ball of the Chicago operators was held at Martine's Hall, Feb. 24. Over one hundred couples were present. At 8:30 P. M. J. E. Pettit, Assistant Manager W. U., led the grand march. Dancing was kept up until midnight, when the company adjourned to the banquet hall—Mayor Harrison presiding. Before supper was concluded his excellency was called upon for a speech.

After excusing himself for coming unprepared, he continued in some brief but happy remarks, reviewing the telegraph from its infancy, the grand strides it had made, its present objects and purposes. He hoped the Western Union would not squeeze the operators too tight to help pay dividends on watered stock. He considered the position of operator one of very great trust. Great secrets were very often intrusted to them, and they had never yet abused the confidence.

After supper, all repaired to the ball-room to finish the balance of the programme. Before dancing was resumed a consolidated informal singing club, composed of Messrs. Long, Rowe, Hughes, Stevenson, Sherwood and others, favored the guests with some of their popular melodies, all joining in the choruses. This feature of the evening was very much enjoyed. Dancing was then resumed and kept up until 3:30 A. M., when the vast assembly repaired to their respective homes, everybody highly delighted with the night's entertainment. All agree in the opinion that it was undoubtedly the most enjoyable ball ever given by the Chicago operators, and one that will long be remembered. Not a hitch occurred to mar its continuous pleasure.

Over the entrance to the hall was suspended an enormous "73" in flowers. In front of the orchestra stood Dr. Rice's perfumery fountain, with three splendid bouquets. This was much sought after during the evening.

The toilets of the ladies were very rich and beautiful and displayed admirable taste. Misses Lane, Conolly, Clark and Kent deserve especial mention. Don't know when we ever saw them looking so charming. (No bouquets, ladies). The gentlemen were not found wanting in the dark and dressy elegance of their costumes. Messages of congratulations were received during the evening from various points. The several committees deserve hearty thanks for their able, energetic and happily harmonious conduct of the whole affair.

Following are names of some of the guests from out of town: Mr. William Mahr and wife; Messrs. Ramsey, Feed and Dunn, of Milwaukee, Wis.; Messrs. J. C. Koons, of Peru, Ill.; William H. Arlington, of La Salle, Ill.; F. M. Crittenton, E. L. Armstrong, G. W. Arbuthnot, Miss Kate Mahony, J. R. Mayor, and W. D. King, all of Omaha, Neb.; P. A. Rogers and C. H. Cobb, of Minneapolis; A. W. Holly, W. H. Bangs, and P. O. Palmer, of Streator, Ill.

PERSONALS.—John Root has resigned and gone to Minneapolis, Minn., to copy press reports. Arrivals.—Charles Johnson has resigned the position of Manager W. U., Rock Island, Ill., and accepted a situation on the night force, this office. All are pleased to see him among us again. S. Crow, from the A. U. to the W. U. day force. Mr. Church, transferred from Dwight, Ill., to night force here. Johnnie Kerrin, from Syracuse, N. Y., to W. U. night force this city. Dan Sweet, on at night. Miss Coats, C. S. Alberts and Ed. Dodge returned from vacation. Messrs. Thayer, Wallace, Lester and Thompson copied Garfield's inaugural address in their usual fine style.

### Bridgeport Notes.

To the Editor of The Operator:

SIR: Telegraphic business in this city is remarkably well provided for, the companies just now maintaining no less than five offices. This number will, undoubtedly, be somewhat reduced when the much-talked-of centralization of offices and forces takes place, which "duplexing" will probably merge all minor offices into one central office, with a branch on the East side.

The different operators throughout the city seem to regard the late consolidation with a philosophical turn of mind, and, as a general thing, do not apprehend any trouble or difficulty in securing positions in other branches of business, should the late "coupling up" leave them out in the cold.

The consolidation, however, is looked upon by our business men with little favor, and, basing our opinion upon the general feeling so far shown, we think the Rapid Company would do well were it to establish an office here, that would offer to the business men of Bridgeport a prompt and reliable telegraphic service at a moderate tariff.

As a result of the consolidation, the A. & P. Co. have recently removed their office location on Wall street, to that of the W. U. Co., and we are daily expecting to see the American Union packing her "grip sack" with a view to engaging a sit at the same place.

The city's telegraph forces, as now distributed, are located as follows, and the company has every reason to congratulate itself on the efficient and brilliant selections it has made: The well-appointed office of the American Union and the large business of that company have been well-managed by Mr. J. S. Krum, a gentleman of considerable experience in the business, who has been very ably assisted by Miss K. B. Porter, a lady possessing fine social qualities, and an expert operator. We are indeed sorry to see this popular office closed, and there are many business men who will echo the regret.

Directly opposite the American Union, pleasantly located in the Sterling House Block, is the comfortable and well-arranged central office of the Western Union Company. In the person of Mr. W. S. Harris, manager, we meet a courteous and affable gentleman, who, on inquiry, kindly gives the "personnel" of the office as follows: W. S. Harris, manager; H. W. Barbour, chief operator; Miss E. T. Bacon, clerk; Mr. F. Hubbard, bookkeeper; Misses E. T. and A. A. Larkin, operators. This array of talent Bridgeport has reason to feel proud of.

Mrs. A. L. D. Barbour is the obliging and capable operator at the Union Depot.

The east side branch offices are well attended to by the Misses F. G. Downs and J. Penfield, Western Union and American Union respectively.

CAMBRIDGE.

BRIDGEPORT, Conn., March 3, 1881.

### Niagara Falls Branch N. Y. C. R. R.

To the Editor of The Operator:

SIR: A more aspiring and wide-awake set of men are seldom found than one may meet on a trip over the Niagara Falls branch of the N. Y. C. R. R. I need not say anything of the train dispatcher, J. Drexelins. He is very much esteemed by all the operators. Mr. Sornberger, his assistant, is always equal to the emergency. First, we find at Spencerport Mr. Austin, who seems content in performing his ordinary duties in a most extraordinary manner. Next comes, at the Basin, Mr. Nelson, who is full of business, with a coal-yard under his supervision. He is also agent for the famous Elgin and Springfield

watches, and has a constant supply of clocks standing in every corner of the depot.

Now comes Mr. Burroughs, at Brockport. West, like Nelson, is wide awake, and can furnish you a fine watch reasonably low. Besides this he is extensively engaged in a manufacturing business. Of what? Why, talent. Telegraph talent; always with two aspirants under his fatherly direction.

Messrs. Waite, at Holley, and Manson at Murray, seem content with the business allotted them by the N. Y. C. R. R. Here we are at Albion, face to face with Miss Hattie Smith, who has served the N. Y. C. some eight years, and is thought a great deal of by the fraternity. She has for assistant Mr. Marsh, who is an expert on the organ, or, in fact, at almost any thing in the line of music. We pass Knowlesville with a G. M. to Lou Hitchcock, and bring up at Medina. Here is Randolph (a real handsome boy), ready to serve us with anything in the line of diamonds, rings, pins, studs, or the like. Walt is an extensive dealer. We shake our hat at Ritson as we pass Middleport and bring up at Gasport. Here is where things are really pushed forward. Mr. Dick Lahey will buy anything that can be hatched, reared or imported; fruits in season, butter, eggs; in fact, he is our Fulton Market. Like Burroughs, he has five embryo-telegraphers under his tuition. Mr. Ganung manages things at Lockport, days, and Mr. Dunkin, nights. Ed. Dunkin is a whole jewelry store. His stock consists of cameos, plain rings, pins, watches, charms and chains. Going ahead to the Junction, we find our friend Day, who has his acre of garden to tend to, but is always around for "33." Passing on to Sanborn, we see Mr. Latz, the stalwart Hancock supporter. Mr. Osterhout is at Suspension Bridge freight-house, and Sam Harroun, assisted by Mrs. Hennessey, tends the depot office.

Messrs. Belden and King take care of Niagara Falls days, and Mr. Cathcart tends nights, and they are just alive with business, too.

ONE OF 'EM.

### Toledo (Ohio) Notes.

To the Editor of The Operator:

SIR: The American Union office in this city has been worked by a very much reduced force for the past month. Among those who have left us are Messrs. Kennedy, Ganson, Campbell, McGill and Williams. Our worthy superintendent, Mr. Seldon, has, however, provided for most of the boys in his district. Mr. McGill is manager of the consolidated office at Ypsilanti, Mich. Campbell has joined the W. U. day force in this city. Kennedy is now in the insurance business and making barrels of money. Ganson holds forth at Ann Arbor, Mich., while our fast man, Williams, "W. C.," has accepted a position as night train dispatcher with the Pennsylvania Railroad in this city. The present force consists of A. H. Thorp, manager; W. W. Umsted, chief operator, with J. H. Hosley as assistant; F. Robertson, night chief. G. E. Scent, M. S. Springer, F. J. Krumling, and Miss Celia Enright constitute the day force. D. F. Desmond is all night man. Mr. T. J. Stevens is manager of the Board of Trade office, and has two assistants.

The boys have been enjoying a hearty laugh, lately, at the expense of an operator who holds forth in the Detroit Western Union office. Out of respect for the youth's parents his name is withheld. It seems that some time ago he held the position of manager in a thriving Michigan town, and, if Madam Rumor is correct, he was considered somewhat of a lady's man. About a month ago, a lady operator who lives not more than a thousand miles from this city took a vacation and visited some friends who reside in the town where our friend was located. While there, she was royally entertained, and, upon one occasion, enjoyed a delightful sleigh-ride with the gentleman mentioned. Now for the sequel. Some time after the visit of the lady, our friend the manager sent his reports to the superintendent of his district, inclosing therewith a voucher for the sum of two dollars for approval. The item was not allowed, as the superintendent questioned the manager somewhat sharply and discovered that it was not a legitimate lineman's expense, as claimed, but a bill for the entertainment of the lady operator, and included the expense of the sleigh-ride, \$1.50, and confectionery, 50 cents!

TOLEDO, March 8, 1881.

HENSHAW.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, MARCH 15, 1881.

Americans visiting Europe will find THE OPERATOR on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

## SWEEP CLEAN.

Now that the new telegraphic management is about to reform the service, let it look into the cases of some of our so-called "managers," whose only claim to their positions heretofore has been their downright heartlessness in "saving" on the salaries of good operators, some of whom are married, with large families, or have been luckless and temporarily down-at-heel. The world will be benefited by an exposure; and, of all things in the world, the telegraphic service will be benefited. Many a "manager" will thus be compelled to seek his level, where, as a petty understrapper in some detective agency, or as a bailiff distraining his fellow-man for rent, he will doubtless feel more at home. We want men with level heads on their shoulders; men who can see two ways at once; men who can distinguish between judicious expenditure and extravagance, and men who can understand that bad pay means bad work all the world over, and that to save at the spigot while the rich liquid flows out at the bung-hole is only a mockery of economy. Let the investigation be quiet, but thorough and systematic, and we will guarantee to the investigators a grand crop of dust-covered official bladders and shams who have for many years been a dead-weight on the service. As we do not own the company, we shall not attempt to run it; but, when we see them, as it were, sweeping out, there can be no harm in suggesting that they swing the new broom around once in a while, and reach up after the accumulation of cobwebs. We can furnish a decidedly interesting list, with specifications, upon which to commence operations.

THE lecture delivered at the Academy of Music, Philadelphia, on Thursday last, on "The Associated Press," was a most interesting one to telegraphers, and attracted many members of that profession. The telegraph and the Associated Press, and the various newspapers comprised in that organization, have always been most intimately connected. It may almost be said that one is necessary to the other. At all events, the subject of "How we get our News" is always a most absorbing one to us, and it is decidedly interesting to telegraphers to know how the Associated Press got its news quickly in pre-telegraphic days. For instance, at the opening of the Erie Canal, 55 years ago (October 20, 1825) and twenty years before the introduction of the electric telegraph, the announcement of the joyous event was telegraphed from Buffalo

to Albany, a distance of 364 miles, in exactly one hour, by the firing of cannon at intervals of eight miles along the entire route. Since then the Associated Press has grown; since then the electric telegraph was born. At that time newspapers were few and far between, and their facilities for news-gathering were extremely limited. To-day, a careful estimate shows that the cities of New York, Philadelphia, Brooklyn, Newark, Boston, Jersey City and Chicago issue collectively 84 daily newspapers, with an aggregate edition of 1,693,000 copies, and an almost countless number of smaller towns following their leadership. Universal intelligence is concentrated in New York, and redistributed twice each day from that centre, and within an hour laid before 50,000,000 people on this continent alone. Of all the ramifications of this vast scheme Mr. J. W. Simonton has been director-in-chief for fifteen years—since November, 1866—and, consequently, no one is better qualified to speak on so interesting a subject. We hope to hear the lecture repeated in New York at an early date.

JOHN GEO. BOYCE was accepted as a member of the Telegraphers' Mutual Benefit Association in August, 1876. He paid his assessments for fifteen months, without being questioned, and died in November, 1877. After his death, the T. M. B. A. collected from his widow two assessments of a dollar each, and then refused to pay her her just claim. An utterly helpless woman was thus struck down, but the blow aroused a chivalrous spirit of which every American telegrapher should be proud. The individual members resolved to pay the claim voluntarily, and the sum thus raised already exceeds \$900, with a few agencies yet to hear from. The following is a complete list of the amounts received from each agency up to February 14.

THE telegraph suits the past two weeks have been about Nip and Tuck. Judge Blatchford has given the English cable companies a back seat—away back—and Judge Truax's opinion is averse to the proposed distribution of \$15,526,590, in accordance with the plan of consolidation. But our readers may depend upon it that that plan of consolidation is going through, all the same. As it stands now, in law, the honors are about even; but it is a settled fact in this country that a man who owns cer-

tain property in fee can do with it as he pleases, except to destroy its value in relation to the entire Commonwealth. So far, a vast majority of the owners of a certain property have said that so and so shall be done; a minority—Mr. W. S. Williams, with 100 shares, and, we believe, Mr. Rufus Hatch—have said it shall not be done; and it now remains to be seen whether or not a free American can dispose of his property in the most advantageous and business-like manner. We have no sympathy with a telegraphic monopoly, and we do not approve of it; but we want common sense and justice for all. If our people want competing telegraph companies, they must pay for them. They must understand that operators do not work for nothing; that it costs something to put up lines in a country where its lakes are like oceans elsewhere. Telegraph companies are not eleemosynary institutions. Let "The Public" do less talking and legislative bulldozing, and give us more money for opposition lines. America is free for all—don't forget it—for capitalist and bankrupt; free from the North Pole to Magellan's Straits, from the centre of the earth to the sky; and if we, as a free people, cannot compete for telegraphic patronage on a square, business-like basis, we had better give it up altogether, and go into coal mining, or some other profitable scheme.

A CANADIAN correspondent requests us to publish the answer to the following:

"Measuring for insulation, 40 miles gives 50,000 ohms. Ten miles further (or fifty miles of the same wire) gives 10,000 ohms. What are the figures for the last 10 miles?"

The answer is as follows: Measuring the wire from the testing station to the extension, 40 miles, we find it to be 50,000 ohms, or a mileage insulation resistance of 2,000,000 ohms.

Now, connecting to the other, we get for the 50 miles an insulation resistance of 10,000 ohms, or an average of 500,000 ohms per mile for the entire 50 miles.

As the average is so greatly reduced, it is obvious that the insulation of the last 10 miles must be much lower than the first 40.

Deducting the last result from the first—500,000 from 2,000,000—we find that we have a deficiency of 1,500,000 per mile, which must be credited to the 40-mile length. We, therefore, divide the amount of deficiency by the number of miles in the first section; that is, divide the 1,500,000 by 40—giving as a result 37,500. Then deduct this result from the first measurement—37,500 from 500,000—the final result being 12,500, which is the insulation of the 10 miles required. This, multiplied by 10, is, of course, the mileage resistance of the 10 miles required, 125,000 ohms.

Or we may get at it in this way: 2,000,000 ohms is the insulation resistance per mile of the first 40 miles. 500,000 is the insulation resistance per mile of the entire 50 miles, showing that the average of the 40 miles is just 4 times better than the average per mile of the 50 miles. Dividing, then, the 500,000 by 4, we get 125,000, which, divided by 10, to reduce it to the 10-mile length, gives 12,500 as the insulation resistance of the 10 miles.

THE Western Union has been rather unfortunate lately in preserving the secrecy of messages intrusted to it for transmission. It was only last summer that the private messages of Chairman Jewell, of the Republican National Committee, were given into the hands of Chairman Barnum, of the Democratic National Committee; and now we hear of a bale of old papers on the way to the

rag factory being accidentally broken open, and the streets of Hartford, Conn., being, in consequence, "full of old Western Union messages." Now, no one wants his private correspondence strewn all over Connecticut. Many a man sends a telegram, not for the saving in time which it affords him, but for the particularly impersonal manner in which he can thus approach his correspondent—virtually in the handwriting of the receiving operator, not his own; but when it comes to having the original copy kicked around the public highways, he has certainly no use for the telegraph. We have always thought that the company which deals in special messages, such as "blacks" and "reds," could still further improve upon the system by having, say, "blue" messages—a system by which, through a slight extra payment, the sender could have his original message returned to him personally, or mailed to his address immediately after it is sent. Anyone familiar with the nature of telegraphic correspondence—especially that coming under the generic title of social messages—will not be at a loss to imagine why certain patrons of the telegraph would not gladly pay double the usual price for a message in consideration of having the original draft returned to them. It is not pleasant to know that your messages will subsequently be sold to the junk-shop and possibly scattered all over the State of Connecticut.

It is a common joke to say that down in Delaware the police carefully lock up the doors and bar the windows of the State Prison every night so as to keep out the local burglars; but, whether this story be true or not, it could be no worse than the fact of an American District office being burned up in this city. The American District advertises that vigilance as to fire on the premises of its subscribers is one of its great specialties, and that every office is manned with a patent fire annihilator; but when the public comes to read of the flames destroying an American District office, in spite of its boasted vigilance, licking up the patent fire extinguishers besides, its confidence in American District cheap-labor methods is in a measure, so to speak, destroyed.

A REPORTER of the *Sun* interviewed an operator last week in this city, and learned that the spirit of distrust is very general throughout the ranks. The telegraph man told the reporter that "all the Atlantic & Pacific and American Union offices in Oswego, Peoria, Nashville, St. Joseph and Leavenworth, and those throughout Iowa, have been closed. With the exception of Milwaukee, none are open in Wisconsin. They are being generally closed throughout the United States, and you can look for a complete closing up of their offices when the consolidation is a working fact. I know that before the 15th of March the Buffalo, Cleveland, Toledo and Detroit offices, and all the offices under the Wabash Railway system of telegraph lines, are to hang out the Western Union sign."

THE 10th inst. was the twenty-seventh anniversary of the organization of the first Atlantic Cable Company. The original compact was signed by five persons—Cyrus W. Field, Peter Cooper, Moses Taylor, Marshall O. Roberts and Chandler White. For twelve years those men toiled before their scheme became an accomplished fact. At the end of that time Captain Hudson, after the cable had been drawn to its anchorage on shore, surrounded by his crew with uncovered heads, fell upon his knees, and, be-

neath the stars, gave thanks to Almighty God for his gracious favor and for the new power then born into the world. "Peace on earth, good will to men," was then flashed under the sea, and the good work has gone steadily on.

NOTHING better shows the character and ambition of the members of our profession than the steadily increasing circulation of THE OPERATOR and the great sales of our books. The works of reference, such as the Dictionary and Telegraphic Tales, and the standard electrical works, are taken so readily and so generally that there is no mistaking the extent to which electrical knowledge is being diffused, and the good effect which it must have ultimately upon the profession at large. Many apparently poor operators, in far-away districts, are ordering at one time a full list of our books, and are thus laying the foundation of a useful and ornamental home library.

CONSOLIDATION and monopolies seem to have become general. A recent dispatch from London says that the West Coast Company, now operating cables in Peruvian waters, has completed arrangements to connect with the Central and South American Cable Co., by way of Panama, Central America, Mexico and the United States to Europe. This will be a good thing for our merchants, since all messages from this country for South America are now sent across the Atlantic to Portugal and thence back again to Brazil. The new connection will save a distance of 8,000 miles in transmission and about six dollars a word on the cost of messages.

THERE is a new instrument going into use in England for the purpose of receiving Greenwich time signals at telegraph stations, etc. Hitherto, the passage of the time signal current along the lines gave no other indication of its presence than a deflection of the needles of ordinary instruments and a corresponding movement of the armature of the Morse ink-writer and sounder at 10 A. M., and the eye had to be kept constantly on the instrument to learn the exact time. In the new instrument, there is an arrangement which rings a bell and at once arrests attention when the first part of the time signal is transmitted.

THE AMERICAN RAPID TELEGRAPH COMPANY, at a meeting of stockholders last week, voted to increase its capital stock to \$10,000,000, and to extend its lines to the principal cities in the United States. The directors, at a subsequent meeting, directed the treasurer to offer the \$6,000,000 of increased stock to stockholders of record of 15th inst., pro rata, at par, the right to expire on 25th inst. They also authorized the President and Executive Committee to make contracts for extensions at once.

THE payment of the Boyce claim is now an assured fact. The case, after being tried *coram non judice*, has been brought before the High Court of Appeals—the operators—and has been honorably settled. The fund has now reached over \$925, and we hope that no effort will be spared to make up the full amount due. It is, at all events, a most gratifying exhibit, and proves that the telegraphers will permit no stigma to be wrongfully put upon the memory of a deceased comrade.

SINCE Senator Windom has been called to the Cabinet of President Garfield, additional weight has been given to the meaning of his extraordi-

ary letter to the Anti-Monopoly League, in which, among other ridiculous things, he intimated that the great telegraphic combination was about to capture the Associated Press of New York. Senator Windom thus places a very small estimate upon the ability and power of the press, but he need give himself no anxiety on the subject. The press will look out for itself.

THE latest improvement in our methods talked of is a public competitive trial of the several systems of electric lighting. The various inventors are holding back, one being afraid and the other daren't, for they have all been a trifle sensational. But the critical public has at last recognized that the day of promises has passed, and demands the competitive trial. The first company to issue a challenge will become immensely popular, for everyone wants light on the subject.

OUR Government should appoint a commission of skilled telegraphers to attend the Paris Exhibition of Electricity. Hitherto, among other things, it has been nearly impossible to obtain a full and sufficient comparative estimate of competing systems of electric lighting, but the result of the examination of the committee intrusted with the consideration of them at this Exhibition is very likely to be accepted by the people of all nations as final for years to come.

Now that reforms are being introduced in the telegraphic service, it would be a good time to abolish the deadhead, or free, business. There is no good reason why every man should not pay for his own telegraphing. The senders of messages might also be forbidden to use prefixes such as "Col.," "Mr." and "Messrs.," and affixes, such as "Esq.," in the address, unless paid for as extra words.

FIFTEEN hundred miles a minute brings to the mind dreams of "wings as swift as meditation, or the thoughts of love," yet that was the speed of the cable message to Australia, announcing the result of a boat race—12,000 miles in one hour and twenty minutes.

MESSRS J. H. BUNNELL & Co. again present, in a full page of this issue of THE OPERATOR, the remarkable indorsements of their new Steel Lever Key. The testimonials embody very favorable opinions from over five hundred practical telegraphers in all sections of the United States.

THAT Second Division of the Telegraphers' Mutual Benefit Association seems to be in a pitiable state of collapse. The First Division tried to squirm out of the Boyce claim, and "Bad Pay" is a poor motto with which to start an offshoot. Pay the Boyce claim first.

THE dividend declared by the Western Union last Wednesday is virtually an actual dividend of 1½ per cent. on the entire capital of the new company of \$80,000,000. This is a good beginning.

THE Western Union has declared a dividend of 1½ per cent. on its stock, as well as on the certificates of indebtedness issued to holders of the stock of American Union and Atlantic & Pacific.

MR. D. O. MILLS has resigned his position as a director of the Western Union, and Mr. Sydney Dillon has been elected to fill his place.

WESTERN UNION stock is quoted at 116½, A. U. at 80¾ and A. & P. at 48¾. Last issue they were 110, 67½ and 44, respectively.

## Ogden, Utah, Items.

To the Editor of The Operator :

SIR: Since last item from here many changes have taken place. The latest arrivals are John Fletcher, Charles H. Crowell, J. B. Sheldon, and A. J. Booth. Departures: Frank Umphred, for Gotham; John Ledwedge and R. A. Empey, for Virginia City. The latter went to Virginia to confer with Hop Kee upon matters pertaining to the Chinese treaty. Charlie Crowell brought with him an insatiate desire for mince pie, and this constitutes the chief staple of his diet. John Fletcher is night chief, and is generally liked. M. J. Burke is day chief. A partition now separates the rabble from the manager, who is thereby enabled to transact clerical business away from the din of the instruments, and also to conceal from prying eyes the communications bearing the device, "respectfully referred."

The Telephone Exchange here is in a prosperous condition and shares advancing. Mr. Pattison, manager of the W. U., is at the head of this department. John L. Morris is reported to have recently sent over a rocky railroad wire, 60 messages an hour for five hours, to Omaha, the receiver being a young lady, "Effie" by name. This is a worthy record.

On dit, that A. W. Todd will return here soon, after a year's sojourn in Denver. Two ladies, Mrs. Barnum and Miss Amy Stephenson, serve by their presence to maintain decorum at the main office. Fred Rawlins, for six years train dispatcher on C. P. at this place, has resigned and is succeeded by Mr. Pierce, the next in rank. Many will doubtless remember O. H. Pratt, who, 8 years since, at Salt Lake, was considered one of the stars. He is not telegraphing now, and dissipation is hastening the approach of the man with the scythe and glass. Aaron Hilliker, also an old landmark, is at Dillon, Mont., in charge of U. & N. R. R. office. Los Mimbres, N. M., is to be a second Ogden, being junction of the Southern Pacific and A. & T. & S. F. Railroads, and there is much conjecture as to who will be appointed to take charge there. When once established, it will relieve the present crowded condition of wires on this route, for which over-worked telegraphers will be thankful. The boys here are now pretty well settled, and no departures are contemplated. "Are you working for McNum or Woolner this month?"

OGDEN, Feb. 29, 1881.

AJAX.

## Cleveland Chronicles.

To the Editor of The Operator :

SIR: The A. & P. office in this city was closed last Friday, and the majority of the operators transferred to the Western Union, but it is rumored they are employed only until the tenth of this month. The outlook for operators just now is certainly not very good. Those thrown out of employment here by the recent consolidation will look anxiously forward to the time when the Merchants' Company will open up, which, it is said, will be but a few months.

Mr. Edgar W. Collins ("I Dunno") is slowly recovering from his long and severe illness, though it will, perhaps, be several months before he is quite himself again.

Mr. Fred Remy, one of the army of traveling telegraphers, has concluded to stop a short time with us, and take in some extra before continuing his trip across the Continent.

THE OPERATOR'S portraits of distinguished telegraphers gives general satisfaction here, and is, alone, considered by all well worth the subscription price of the paper.

Mr. C. F. Williams, for many years chief operator at the A. & P. office, is taking National Press report at the Western Union. Mr. Will Cummings, a former Cleveland operator, is train dispatcher at Palestine, Texas.

CLEVELAND, O., March 9, 1881.

BRUTUS.

## TELEPHONE DEPARTMENT.

The musical telephone puts on too many airs.

Toronto papers say that the telephone wires were rendered almost useless in that city during the snow-storm last Friday week.

The telephonic exchange system in Cleveland, Ohio, and several other places, contemplates a tariff based on single messages, a "message" consisting of a conversation through the ex-

change occupying five minutes or less time. The charge is ten cents per "message," beside which tickets good for one message each are sold at the rate of \$7 for packages of 100.

The Government of Queensland, Australia has recently introduced the telephone both for Government and private use in that colony. The Government provides and maintains the lines for a rental of £5 (\$25) per mile per annum, and those participating in the benefits supply and keep in working order the required instruments, which, by regulation, must be solely used for their own business.

A dispatch from Washington, D. C., on the 11th inst., says: A few weeks ago more than 200 patrons of the local telephone company rebelled against an extraordinary increase of the prices of service, and formed a protective association. Since that time very little has been heard of the controversy, but the members of the association are faithful to their compact, and are determined to break down, if they can, what they regard as an oppressive monopoly. Among the members is a firm of real estate agents, who control 100 houses. They intend to compel the company to remove its wires from all these houses. Others are taking the same course, and it is expected that in a short time the company will find it difficult to extend its many wires to the houses and offices of subscribers who still submit to the rates.

The following correspondence over the telephone wires yesterday, says the Kansas City Times, is a further proof of the fact that no one but a bald-headed man could do without one:

"Hello, central!"

"Hello!"

"Connect me with the signal bureau."

"All right—go ahead."

"Hello, signal!"

"Hello!"

"Is it going to thaw to-day?"

"Yes, there are indications."

"How's the wind?"

"Getting around to the south."

"Do you think I can safely have my hair cut?"

"Wait a minute until I consult the barometer, thermometer and wind gauge." (Silence for half a minute.)

"Hello!"

"Hello!"

"Yes, you can go ahead. There won't be any change to speak of for the next twelve hours. There is a cold wave moving up the Ohio River, and a snow-storm is reported at Cheyenne, but if I were you I'd take my chances on the hair cutting."

"All right—much obliged."

"Good bye."

## DASHES HERE AND THERE.

The "brush light."—A barber's lazy boy brushing your clothes.

All the principal light-houses in France are soon to be provided with electric lighting apparatus. The contracts have been already awarded.

A dispatch dated Havana, March 6, says that the English steamer Hooper has successfully laid a cable between Cienfuegos and Santiago de Cuba.

It is said that an 800 horse-power engine will be used at the Electrical Exhibition at Paris to work 600 electric lamps, which are to be distributed about the building and grounds.

The Hite Mine, recently sold in this city for \$600,000, and which had previously yielded its owner net profits to the amount of \$1,300,000, adjoins the North Hite and Yosemite mine, advertised in THE OPERATOR.

On the 11th ult. an application was made to the Postal Telegraph Department by the War Office, in England, for a complete equipment of telegraph matériel, operators, etc., to be shipped for the Ashantee coast. The length of line to be erected is ten miles.

Ordinary letter-paper, if well heated and briskly rubbed with the hand or with a brush, acquires electric properties. It adheres to tables and walls, and when the hand is brought in contact with it slight electric discharges are quite visible if the experiment is made in the dark.

There was a small electric railway opened for

exhibition purposes at the Calcutta Zoological Garden, and it was greatly patronized by visitors. When it was taken down, regret was expressed. This mode of transit has evident advantages for cities, and during warm weather.

It is said that when the new contract between the New York, New Haven & Hartford road and the Western Union Telegraph Company has been arranged, the telegraph offices at Norwalk, Stamford and Bridgeport, Conn., and New Rochelle, N. Y., will be kept open all night.

The newspapers are extracting lots of fun out of the telegraph consolidation. One says that the color of the new telegraph stock should be old Gould; another suggests Green; a third one thinks they should be printed on the press that Vanderbilt, while a fourth Sage-ly says these are Keene witticisms. That Bates all.

A telegram from Ottawa, Ont., says that the Minister of Justice introduced a bill March 11 to prescribe the oath to be taken by employes on telegraph lines under control of the government. There is a strong disposition in Parliament favoring the government assuming control of the telegraphic system of the Dominion.

Information has been received by the Cuba Submarine Telegraph Company (Limited) of the successful laying of their new cable between Cienfuegos and Santiago de Cuba. This is the third cable which has been laid by the company between these points, but, as the 1870 one has ceased to work, only two are now in operation.

Combette's electric pipe-lighter is composed of a bichromate of potash battery inclosed in a bottle hermetically sealed, the two poles of the battery being connected with a very thin platinum spiral placed above the candle. To light it it is only necessary to tilt the bottle, when the battery becomes active and heats the spiral.

On the 7th inst., the President of the Mexican Cable Company in this city received a cablegram from Bogota stating that the President of the United States of Colombia had executed a contract with the Central and South American Cable Company, north and south from the Isthmus of Panama, to connect with the United States and Europe, by way of Central America and Mexico.

An automatic buoy having a 10-inch whistle and a glass globe for an electric light has been moored in 13 fathoms of water to the southward of the Sandy Hook lightship and about three cables' length away. The inventor of the buoy claims that it will show an intermittent electric light, the electricity being generated by the action of the waves. The Lighthouse Board has permitted this buoy (the private property of the inventor) to be placed where it is to test it.

A dispatch from Ottawa, on the 2d inst., says: To-day Mr. Langevin, Minister of Public Works, moved in the Commons for assent to a resolution approving of the scheme proposed by Mr. Sandford Fleming, late chief engineer of the Canada Pacific Railway, for the construction of a cable from Nanaimo, in British Columbia, to Yeddo, via the Aleutian Islands. A company had offered to lay the cable conditionally on receiving a twenty years' monopoly. The motion was lost, the House objecting to the monopoly clause.

Thomas A. Edison has removed from Menlo Park to this city with his family and all but one of his assistants, and is now living at No. 65 Fifth avenue. The house was formerly known as the Bishop mansion, and has been leased for a long term of years by the Edison Electric Light Company. The technical department of the business is now carried on here. The offices of the Edison Lumining Company of New York, the Edison Electric Light Company of Great Britain and Europe, and the Edison Electric Railway will also be in the building.

"What keeps this frame going?" exclaimed Dr. Tanner to an Indianapolis Journal correspondent. "Electricity! That's what does it. We are run by lightning, and Edison might profitably make some experiments on it. I believe that I was kept alive for those forty days by the electricity obtained from the air and the water. Faraday estimated that in a teaspoonful of water there is enough electricity to make a good sized flash of lightning. I claim that it is electricity that runs this machine, and I am willing to stake the machine on the correctness of my theory."

A patent for till alarms or safety money drawers has recently been issued to Mr. Walter L. Cheney, of Orange, Mass. The contrivance is said to be ingenious in construction, easy in operation and very secure. Mr. Cheney was formerly draughtsman and operator for the Pratt & Whitney Co., Hartford, Conn., and is at present foreman of the Gold Medal Sewing Machine Co., Orange, Mass. He is anxious, however, to secure a position as designer and draughtsman, and prefers electrical work. Those requiring services of this character can address Mr. Cheney at Orange, Mass.

One of the handsomest of publications is the *Illustrated Scientific News*, published by Munn & Co., New York. Every number contains thirty-two pages, full of engravings of novelties in science and the useful arts. The March number contains, among various other subjects illustrated, a number of engravings of Capt. Eads' proposed ship railway across the Isthmus, and a novel hydraulic railway locomotive. The *Scientific News* will be found instructive and entertaining to all classes, but will be best appreciated by the most intelligent. Published by Munn & Co., 37 Park Row, New York, at \$1.50 a year, and sold by all news dealers.

There was recently an exhibition in this city of the House rapid telegraph system, and everything worked to the satisfaction of all present. House, it will be remembered, is one of the founders of the present telegraphic system. The first machine of the rapid telegraph plan resembles a type-writer. The operator works off the message on the key-board, but instead of printing the words they are cut out in the paper. This perforated message is then sent through machine number two. All that has to be done is to turn a crank, and the words and figures go like lightning. There is hardly any limit to the speed at which the message can be sent. Machine number three receives the dispatch and prints it automatically. The message can be received without an operator, and can be sent to the person it is intended for without being rewritten.

The *Toronto Mail*, of February 23, says: "A very interesting operation was performed in the Toronto General Hospital at 2 o'clock on Saturday afternoon. It consisted of amputation by means of electricity, of the left leg at the hip. The patient, a young man, being reduced very much by the sloughing of an open wound on the outside of the leg, it was desirable that he should lose as little blood as possible. Having placed the patient under the influence of ether, the customary flaps were made, and then a platinum wire, attached to the two poles of a galvanic battery, was encircled round the leg under the flaps. In a moment this wire was brought to a white heat, and began to cut its way through the limb. By the great heat the ends of the arteries were contracted, and only the larger ones required to be tied. Many of the leading surgeons of the city and a large number of the students from both schools were present."

The question has often been asked as to what becomes of all the old telegrams, which, throughout the United States, must accumulate at the rate of at least ten tons weight every day. The question was indirectly answered on the 25th ult. by a telegram from Hartford, Conn., which announced that a package of paper stock on its way to the Walker Paper Mill had burst open and that the street had immediately become full of old Western Union telegrams. The bale was made up entirely of old telegrams on their way from the Western Union building in this city to the paper mill. President Green, when asked how such an accident could happen, said: "We collect all the filed telegrams in the uppermost story of this building. They are preserved in order that we may have them for exhibit in case of any trouble. Chicago is the collecting centre for the Western States, while here we gather in the telegrams from the Eastern, Middle and Atlantic States. After six months they are baled up by a machine we have and securely sewed and strapped in packages. It was our habit to sell to any mill and then send a man along with the packages to see the paper made into pulp. About seven years ago we made an arrangement with Mr. Walker, and he takes all the old stock, which is sent directly from this building to his paper mill. We could not very well burn the papers, for we have in this city

alone about 65,000 messages a day, and they weigh nearly 250 pounds, and then the accumulation from the out-of-town offices swells the amount very materially. We guard the dispatches all we can, but they do leak out. You remember how they got out in the campaign of 1876. Well, the Everett House, where the Tilden committee met, was on the same wire as the Westchester House in the Bowery. There the office was in the hotel lobby and a man sitting there with a paper before him was within ear-shot of the instrument and so could take in all the messages *in transitu*. This we have since found out was actually done. We use every precaution we can to insure the privacy of dispatches, but accidents will happen even in the best of households, and just now, you know, we have three households in one."

## NEW YORK CITY ITEMS.

### Echoes from 195.

Mr. Wm. F. Lewis, who for the past month has been temporary manager at Glens Falls (N. Y.) office, has again returned to 195.

Mr. Tom Allen has been appointed Traffic Chief at Large, and the appointment gives much satisfaction in the office. Mr. Allen is an old and faithful employé of the company and deserves the promotion.

A correspondent at 195 writes: THE OPERATOR'S Chicago correspondent, in his notes of last issue, strikes a responsive chord in the breasts of all modest telegraphers, when he bewails the too prevalent custom of "talking shop" in public places. If operators cannot speak intelligently upon any subject but that of their profession, they may at least adopt a confidential tone of voice that will not attract attention from all around them, and provoke a general stare of amusement at the expense of the indiscreet babblers of telegraphic exploits. Let these youths adopt the expedient of a prominent soap manufacturer last summer, and if they must advertise themselves let them have their hats stamped with the legend—not "Higgins's Laundry Soap;" but, "I am a Telegraph Operator, 73."

### Other City Items.

Mr. Henry Van Hoevenbergh has returned from London, where he went to introduce his new printing telegraph system. He was very successful in establishing the system in London for the Central News Association, and sold to the latter the patent right for Great Britain.

Referring to the item in last issue about the Andover operator who can do satisfactory work, although without arms, a correspondent at 14½ Broadway says they have in that office a night man who can send ten thousand words or more of press while sound asleep, and the operators on the line affirm that it comes along at a Gay rate.

The American Rapid continues to thrive. Business is on the increase daily, and we are opening new offices every week. Applications for positions come in from all parts of the country, but very few are accepted. Among the late arrivals are: Miss M. L. Bowditch, W. U.; Miss L. S. Maguire and Messrs. A. B. Cook, A. Krum and J. B. Knapp, A. & P.; Mr. J. S. Krum, A. U., Bridgeport, and C. E. White, A. U., Holyoke. Our "Southern Fast" is in charge of H. J. Malone, "Way East" is worked in good style by F. H. Avery, while Boston Special is in the hands of G. B. Mason, who "turns" out business at the rate of fifteen messages a minute.

BIX.

## PERSONALS.

Owing to the consolidation, Mr. A. D. Skinner, who recently went to Atlanta, has returned to Boston.

The A. & P. office in Atlanta, Ga., has been closed, throwing Manager Turner and Operator Hamilton out of employment.

The seven-months-old infant of Mr. F. A. Patrick, Manager of the Beaumont, Texas, office, died March 7 of congestion of the brain.

Mr. R. P. South, an operator on the Police and Fire Alarm telegraph line, 22nd district station, Philadelphia, died in that city on the 28th ultimo. He had held the position for nine years.

Cloverport, Ky., is boasting of having been the birthplace of many eminent men; among them ex-Senator Flanagan, of Texas; Governor Crittenden, of Missouri; Governor Murray, of Utah; and Dr. Norvin Green, President of the Western Union.

Mr. George W. Shaw, for the past two years manager of the telegraph office at the general offices of the Burlington & Missouri River Railroad, Omaha, Neb., has been transferred to Lincoln as a dispatcher. Mr. J. H. Hill succeeds him as manager.

Stephen Lawrence, manager of the Western Union office at Hudson, N. Y., who died at that place Feb. 26, was 56 years of age. He had charge of that office since it was first opened, about 30 years ago, and was one of the oldest active operators in the State.

Mr. F. T. Clohesey, chief operator A. U. Telegraph Co., Kansas City, Mo., was married Feb. 23, at Bay City, Mich., to Miss Lizzie Fox, of the latter place. The presents were numerous and elegant. During the festivities a telegram was received from Mr. Clohesey's collaborators in Kansas City, wishing the happy couple every happiness.

Mr. E. A. Howe, formerly A. U. night chief at Cincinnati, O., has succeeded J. W. Burton as manager of the A. U. in Atlanta, Ga. Mr. Burton is now with the W. U. at Chattanooga, Tenn. Sid. Stevens, of the Atlanta office, left the business March 1, and Mr. Hamilton, late of the A. & P., has taken his place.

Mr. J. H. Wade, of Cleveland, O., who is well remembered in telegraphic circles, and who within two years has paid \$80,000 for the erection of a building for the Protestant Orphan Asylum of that city, has just paid some \$12,500 additional for improvements made to it, and has authorized the trustees to build a school-house such as is needed, and to draw upon him for the cost.

A Boston correspondent writes: "In a former issue of THE OPERATOR I notice the death of the batteryman at Albany and the statement of his having filled the above position for twenty-three years, thus being the oldest batteryman in the company's service. Allow me to correct this statement in favor of Mr. John Hutchinson, who has been batteryman at the W. U. general office, 109 State street, Boston, for the last twenty-eight years, and is still doing good service there."

There is a little group of well known old-timers on the Denver & Rio Grande Railroad. Ed. Schermerhorn, "Skimmy," is a section hand at Veta Pass, and says: "It's a splendid job." Jack Martin is train dispatcher on the San Juan Division and doing finely. John W. Smith ("Q") is chief operator in superintendent's office at Denver, and Mr. Woodward's right-hand man. Fred Loomis, an "old time operator," but for some time past bookkeeper in the general offices, is now a passenger conductor on the San Juan Division, and looks quite military in his blue coat and brass buttons. Ed. Cuthbert, formerly of the Denver W. U. office, is in charge of the telegraph at treasurer's office at Colorado Springs.

## BORN.

STONE.—On Sunday, March 6, 1881, to Mr. O. M. Stone, Manager A. & P. telegraph office, Chicago, Ill., a daughter.

LEGG.—At Fosland, Ill., Feb. 28, 1881, to H. C. Legg, Agent W., St. L. & P. Ry., and Manager W. U. Tel. Co., a son.

BRADY.—Feb. 27th, 1881, to Mr. J. L. Brady, operator B. & P. R. R. Union depot, Baltimore, Md., a son.

## DIED.

LAWRENCE.—At Hudson, N. Y., on the 26th ult., Stephen Lawrence, manager of the Western Union office at that place.

SOUTH.—At Philadelphia, Feb. 28, 1881, R. P. South, of the Police and Fire Alarm Telegraph.

MARTIN.—March 3, at the residence of her son, Mr. Wm. Martin, head receiver W. U. Tel. Office, Boston, Mrs. Sarah Martin, aged 80 years.

## A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

# J. H. BUNNELL & CO.'S NEW STEEL LEVER SOLID TRUNNION KEY

PATENTED FEB. 15, 1881.

BEST IN THE WORLD.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for rapid and perfect Morse sending for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine wrought steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking is absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert or the beginner.

PRICE, \$3.00. FINELY FINISHED, AND LEVER NICKEL-PLATED.

LIBERAL DISCOUNT ON ORDERS FOR COMPANY SUPPLY.

Steel Lever Key sent by mail post paid, to any part of the U. S. or Canada on receipt of the above price, by registered letter or money order.

## THE AMERICAN UNION TELEGRAPH CO.

New York, Dec. 18th, 1880.

J. H. BUNNELL & Co.

Gentlemen:—We have in use in this office, sixty-eight of your Steel Lever Keys.

The general verdict regarding them is, that **THEY ARE THE BEST KEYS EVER PUT ON A DESK.**

Yours truly,

WM. J. DEALY,  
Manager Am. Union Co.'s (Main Office).

## UNION PACIFIC RAILWAY CO. (Telegraph Dep't).

Omaha, Neb., January 15th, 1881.

J. H. BUNNELL & Co.

Dear Sirs:—Your instruments meet with much favor on this company's lines and give good satisfaction. The Steel Lever Keys, especially, are much admired by the operators who generally pronounce them *the best*. They at once combine strength and neatness, and are well adapted for easy and rapid sending.

Yours truly,

L. H. KORTY,  
Chief Operator.

## CONTINENTAL TELEGRAPH CO.

New York, Dec. 14th, 1880.

J. H. BUNNELL & Co.

There is nothing that I can say that will be too strong in commendation of your New Steel Lever Key. Every one of our operators, without exception, regard it with decided favor, and I am now satisfied that its general use is not only a positive help to operators' efficient labors, but a decided advantage to the general service of the Company. We are using them in preference to all others.

Yours truly,

J. G. CASE,  
City Manager Continental Tel. Co.

## THE ATLANTIC AND PACIFIC TELEGRAPH CO.

New York, Dec. 16th, 1880.

J. H. BUNNELL & Co.

We have six of your Patent Steel Lever Keys in use here in the principal office of this Company. They give entire satisfaction in every way. We consider them a great improvement on the old style of telegraph key.

Yours truly,

P. P. HAUFF,  
Manager Main Office, 145 Broadway, N. Y.

## BALTIMORE AND OHIO RAILROAD CO. (Tel. Dep't).

Baltimore, Dec. 28th, 1880.

J. H. BUNNELL & Co.

Gentlemen:—I take pleasure in forwarding to you the accompanying testimonial, voluntarily contributed by the operators in Camden Station Office, to the superior merits of your New Steel Lever Key.

Very truly yours,

CHAS. A. TINKER, Supt.

## BALTIMORE AND OHIO RAILROAD COMPANY.

(Telegraph Department.) December 27, 1880.  
We, the undersigned operators at Camden Station, B. and O. R. R., Baltimore, having fully tested your "New Steel Lever Key," concur in saying, it is the *best*, without any exception, we have ever used.

Respectfully,

CHAS. P. ADAMS, GEO. R. BUNTING, JR.  
E. J. LITTLE, W. E. KING,  
J. W. FERRY, B. F. HARD,  
A. D. FEASEL, GEORGE BOGGS,  
W. W. MOORE, WM. A. LENZ,  
J. F. McLAUGHLIN, J. W. STAYLOR,  
H. P. BILSON.

And I endorse the above, C. W. CLARVOE, Div. Operator.

From the winner of first prize in the fast sending tournament, New York, August 22, 1880, 500 words in 11 min. 14½ seconds.

"Cable Station No. Sydney, C. B.," Dec. 26, 1880.

Prefer it to any other key I have ever used. It is the general opinion of the operators here that the Steel Lever Key is the best they have ever seen.

W. J. CURTIS.

"Your Steel Lever Key proves to be one of the best improvements ever introduced in Telegraphic Apparatus."

J. H. LOUNSBURY,

Manager Am. Union Telegraph, Hartford, Conn.

All our best senders who have tried it here, praise it highly and pronounce it "fast."

R. J. WYNNE,

W. U. Telegraph, Washington, D. C.

THE FOLLOWING EXPRESSIONS OF OPINION ARE ALL FROM THE WESTERN UNION MAIN OFFICE, 197 BROADWAY, NEW YORK.

We have your keys on the Chicago, St. Louis and Buffalo Quads, Western, Eastern and State Press, and C. N. D. Circuits. Without a single exception, the operators regard them as the very best.

FRED CATLIN.

Best key I ever used.

FRANK VITES.

Having worked your Key on Chicago Quad for the past month, can cheerfully say it is the best Telegraph Key I have ever used.

CHAS. F. HUTCHINSON.

Far superior to any other Key.

COURT M. CUNNINGHAM.

Requires less labor, is capable of greater speed, and sends finer and firmer Morse than any heretofore in use.

J. A. WRIGHT, JR., D. B. CASE,  
RICHMOND SMITH, E. F. HOWELL.

Consider your Key far superior to any I have yet handled.

J. E. SAYRES,  
Cincinnati Quad.

Like the Key very much.

It makes sending easy.  
T. H. ALLEN,  
New Orleans Duplex.

Your Key is, without doubt, the best in the world. It is simply perfection.

J. B. COULTER.

Our only desire is to have one of your Keys put on the Pittsburg Quad. Eitymiller works on the Pittsburg end.

DENNIS BROWN and M. DURIVAN.

Your Key is, in my opinion, unequalled.

MINOR M. DAVIS,  
Philadelphia Quad.

The finest in the world.

J. B. TALTAVAL, J. H. YOUNG,  
St. Louis Quad.

Best I have ever used.

E. H. MILLER,  
State Press.

Prefer it to any I have ever used.

CHAS. W. MINIER.

The best Telegraph Key we ever handled.

W. D. CHANDLER, } Chicago Quad.  
M. LABAUGH, }

There is but one perfect Key, and this is it.

W. C. ATKINSON,  
Baltimore Quad.

FULL LINE OF FIRST-CLASS SOUNDERS, KEYS, RELAYS, AND TELEGRAPHIC EQUIPMENTS OF EVERY DESCRIPTION.

J. H. BUNNELL & CO., 112 Liberty Street, New York.

## UNION TELEGRAPH INSTRUCTION COMPANY.

Established 1875.

Incorporated 1880.

Capital, \$5,000.

## OFFICES:

No 3 PARK ROW, NEW YORK.  
No. 308 FULTON STREET, BROOKLYN.

This Company is specially designed and exclusively devoted to the purposes of teaching Telegraphy and qualifying young ladies and gentlemen for the work of branch city offices, Hotels, Summer Resorts, small country Commercial and Railroad Offices, Private Lines, etc.

Our instructors are all first-class night operators from the Direct Cable, American Union and Western Union offices, and also from the Elevated Railroads. Our facilities for Practical Instruction comprise over seventy sets of new telegraph instruments (forty sets being Bunnell & Co.'s New Steel Lever Keys and New Giant Sounders), Relays, Switches of every pattern, Paper Registers, 150 cells of battery, etc.

CITY LINE CIRCUITS with New York and Brooklyn connected, our operators and advanced pupils constantly transmitting messages for rapid practice.

WEEKLY LECTURES on all subjects pertaining to Electricity, Practical Telegraphy, etc.

Nearly every pupil has a private operating table, with all necessary instruments for his or her exclusive use.

Every circuit worked at a different rate of speed. Pupils are thoroughly drilled in correct rapid sending, forms of Messages, Checks, Tariffs, Office and Circuit Practice, Telegraphic Penmanship, etc., and are kept constantly employed for five hours daily under strictly enforced rules.

We have at present ninety pupils in attendance in both offices, many of whom are relatives and friends of operators and telegraph officials. We have references to nearly 100 pupils now employed as Operators, who obtained their entire practice with us.

OUR TERMS are Ten Dollars monthly. Time required, five to six months; five hours' daily practice.

Pupils who, after one or two months' trial, are found unsuited for the business, are requested to discontinue.

Certificates of proficiency only given to Competent, Careful and Reliable Pupils.

Correspondence invited from those learning in telegraph offices.

D. B. McEACHREN, Manager.

J. P. SMITHERS, Secretary.

### CHARLES WILLIAMS, JR.,

(ESTABLISHED IN 1856.)

109 Court Street, Boston, Mass.,

AUTHORIZED MANUFACTURER OF

## THE AMERICAN BELL TELEPHONE CO.

Magneto, Crank and Push Button Call Bells, Electric Bells, District Bells and Switches for Exchanges, Annunciators, etc.

Telegraph and Electrical Instruments, Batteries, Wire, Insulators, and Telephone Supplies of every Description.

## THREE POPULAR BOOKS, UNIFORM IN SIZE. Telegraphic Tales and Telegraphic History.

A POPULAR ACCOUNT OF

### THE ELECTRIC TELEGRAPH: ITS USES, EXTENT AND OUTGROWTHS.

BY W. J. JOHNSTON,

Editor of "The Operator."

Handsomely Printed on Tinted Paper and Elegantly  
Bound in Cloth and Gilt. 254 pages.

PRICE \$1.

This book has already met with the most gratifying success, both among telegraphers, press and public. The manager of a neighboring city writes: "During sixteen years' connection with the telegraph business, nothing I have read has proved so entertaining." A prominent telephone man says: "I glanced at the book to see what it was like, and did not stop till I had read every word in it." The N. Y. Sun recently devoted three-quarters of a column to a review of "Tales and History," and a London journal, just received, gives it nearly two columns.

"It is seldom that a book containing so much substantial and not easily accessible material of a specific kind is commended to a wide audience by a careful and pleasing literary treatment."—N. Y. Sun.

"The topic chosen by the author is a most interesting one, and by his thorough familiarity with the subject, theoretically and practically, he has succeeded in making not only a useful but a most amusing volume."—N. Y. Times.

Uniform in Size with "Tales and History" and "Oakum Pickings,"

## WIRED LOVE;

A ROMANCE OF DOTS AND DASHES.

BY ELLA CHEEVER THAYER.

The "Old, Old Story" in a New, New Way.

256 PAGES. HANDSOMELY BOUND IN CLOTH. PRICE, 75 CENTS.

Having already issued the FOURTH EDITION of this admirable Telegraphic Love Story (which fact sufficiently demonstrates its popularity, both in and out of the profession), Mr. Johnston takes pleasure in recommending the book to telegraphers and others as a most entertaining, bright, sprightly and amusing work, either for summer or winter reading.

A good book to make you forget business and care, and leaves pleasant memories behind it.—Chicago Inter-Ocean.

A capital love story, the affection having its origin in telegraphic communications between two operators unknown to each other, fifty miles or so apart.—Boston Commonwealth.

The love-making which goes on is done over the telegraph wires, and there is plenty of humor and a dash of mystery about the story which makes it refreshing reading. The heroine is a telegraphic operator, and the way in which her acquaintance over the wires with a fellow operator ripens into something more than friendship, is very pleasantly told.—Boston Journal.

Copies promptly mailed, prepaid, on receipt of price, 75 cents. Postage stamps taken.

"Wired Love" and "Tales and History," together, postage prepaid, \$1.50. "Wired Love" and THE OPERATOR, one year, \$1.50. "Wired Love," "Sam Johnson," and "Tales and History," \$2.00. "Wired Love," "Sam Johnson," and THE OPERATOR, one year, \$2.00. Any of our other \$1 books, in lieu of "Tales and History" or THE OPERATOR one year, at the same price.

A copy of "WIRED LOVE" will be mailed free and postage prepaid to any one sending us a club of three yearly subscribers to THE OPERATOR. Their own and two others will do.

Uniform in Size with "Tales and History" and "Wired Love."

## OAKUM PICKINGS:

A Miscellaneous Collection of Stories, Sketches, Essays, and Paragraphs, Telegraphic and General, By Walter P. Phillips, "John Oakum," with a fine Steel Plate Portrait of the Author.

Fourth Edition, 188 pp.; Medium 12mo; Paper, 50c.; Cloth, 75c.

The welcome accorded this, the first book ever published with the object of giving the telegraph profession a literature of its own, has been general and hearty, on the part of both telegraphers, press, and general reading public in all parts of the country. Mr. Phillips, the author, is well known to the fraternity as a spicy, original, witty, entertaining, and popular contributor to telegraphic and humorous literature, and his character sketches of "Jim Lawless," "Tip McClosky," "Posie Van Dusen," "Cap. De Costa," etc.—all of which are contained in Oakum Pickings—have won for him an enviable reputation as a humorous sketch writer.

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00

The three books and THE OPERATOR one year, or any of our other \$1 books..... 2.75

The three books, THE OPERATOR one year and The Dictionary, or any other \$1 book..... 3.50

"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with THE OPERATOR, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

## American Bell Telephone Co.

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly, or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This Company desire to arrange with persons of responsibility for establishing

### DISTRICT OR EXCHANGE SYSTEMS,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as agents, for the purpose of establishing

### PRIVATE LINE

AND

### CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company, No. 95 Milk street, Boston, Mass.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## THE BISHOP GUTTA-PERCHA WORKS,

Original and only Manufacturers in the U. S. of

**PURE GUTTA-PERCHA GOODS,  
422, 424, 426**

**EAST TWENTY-FIFTH ST., N. Y.**

ESTABLISHED IN 1847.

### S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description, under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA for Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds.

Submarine Telegraph Cables, 50 varieties, one to ten conductors.

Submarine Telegraph Canal Cables—any number of conductors.

Aerial and Underground Cables of all styles. Hemp armor covered.

Lead-Covered Telegraph Cables, one to seven conductors.

Office Cables, one to seventy-five conductors, gutta-percha and cotton-covered.

G. P. Insulated Wire of all sizes.

Fuse, Leading and Connecting Wires for submarine and mining purposes.

Marks' Compound Office Wires, various sizes, for office, underground, and outdoor use.

G. P. Office Wire, cotton-covered.

Flexible Elevator Cables, any number conductor desired, of every style, and for all purposes.

Compressed Electric Cotton and Linen Double and Triple Covered Cordage any style or pattern.

Burglar Alarm, Call Bell and Annunciator Wires, double cotton wrapped and saturated with any preparation.

Magnet Wires, copper and German-silver, cotton, silk, and fibre covered.

Copper Wires, specially covered for electrical lightning purposes.

Telephone Flexible Cords and Magnet Wires, finest and best manufactured.

## THE DELANY RELAY AND SOUNDER.

RELAY.

SOUNDER.

The above cuts illustrate the Delany Patent Telegraph Relay and Sounder, now being manufactured and tested with a view to their general introduction on all Telegraph Lines liable to be affected by the Page Patent. These instruments are in all respects superior to any now in use.

Railroad companies and others desiring instruments for trial should apply to

**THE DELANY PATENT RELAY COMPANY,  
61 BROADWAY, NEW YORK.**

## JEROME REDDING & CO.'S LEARNERS' INSTRUMENT.

PRICE FOR THE COMPLETE "GEM" LEARNERS' OUTFIT, \$4.20.

Consisting of the above large-sized Sounder and Key, a good Cell of Callaud Battery, one roll of Office Wire, Book of Instructions, Chemicals, etc. The only low-priced Learners' Instrument made that has perfect adjustments for both Key and Sounder Lever.

Price for Complete Outfit.....	\$4.20	Price for Instrument alone, by mail, post-paid.....	\$4.00
" Instrument alone.....	3.40	" Instrument alone, for lines 1 to 15 miles.....	4.00
" the whole outfit (except Glass Jar) with Key and Sounder separate, by mail, post-paid.....	4.80	Price for Instrument alone, for lines 1 to 15 miles, by mail, post-paid.....	4.50

# ZEITSCHRIFT FUR ANGEWANDTE ELECTRISITATSLEHRE.

Editor: F. UPPENBORN,  
Weinstr 5, Hanover (Germany).

This periodical, which appears semi-monthly, contains the latest developments in

Electrical Science, Telegraphy, Telephony,  
Electric Light and Electro-Metallurgy,

with particular reference to the progress in electricity made in the

## GERMAN EMPIRE.

It is well-illustrated by first-class Lithographs and Engravings, and brings abstracts or lists of all English and German patents.

Subscription Price, M. 20 Yearly (\$5).

Volumes 1879 and 1880 now ready,  
at M. 24 for both.

Proof numbers can be had free on application.

## Leclanche Battery.

(PATENTED.)

"Prism Battery" Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of

SIMPLICITY AND EFFICIENCY

In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

ADOPTED AND USED BY THE

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and removed than any other battery. Beware of

Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

**The Leclanche Battery Co.,**

40 West 18th St., New York.

EVERY DESCRIPTION.

## TELECGRAPHIC SPECIALTIES.

### THE GIANT SOUNDER PERFECTED.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, \$5; by mail, \$5.40.

### THE DELANY PATENT REVOLVING DISC,

OR UNIVERSAL PLATINA CONTACT KEY.

This key embraces the only positive remedy for sticking; obviates direct anvil pounding, and thereby prevents operators' paralysis. Legless, hard rubber base, nickel-plated, and the handsomest, most durable, and only perfect key manufactured. Price, \$5; by mail, \$5.35.

### CHAMPION LIGHTNING ARRESTER.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

### THE CHLORINE BATTERY.

D. H. Fitch Patent, Sept. 16, 1879. For telephones, burglar alarms, call bells, etc. Price per cell, \$1.75.

### PREMIUM LEARNERS' APPARATUS.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS AND OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

Price, Complete Outfit.....	Money in advance, \$5 00
" Instrument without Battery.....	" " 4 20

### THE CABLE'S MUSING.

Far down, where the bed of the ocean  
Is wrapped in its colorless sea,  
Where the blending of calm and commotion  
Comes only as echoes to me,  
Where the coral reefs serve me a pillow,  
And the nautilus' lullaby seems  
Like the murmuring cadence of billow,  
To soften and sweeten my dreams;

I slumber alone in my dwelling,  
Since Vulcan withdrew with his train,  
And through me the nations are telling  
Their throbbings of pleasure and pain;  
And with fairy-winged messengers speeding,  
My being is pierced o'er and o'er,  
While the changes their missions are breeding,  
Are trembling from opposite shore.

Now through the walled cities I'm roving,  
Where hope adds a lustre to fame,  
And tidings of joy to the loving  
Are heard in the absent one's name;  
Or out where the green hills are reaching  
To kiss the blue canopied sky,  
I live while all nature is teaching  
The pleasures her members supply.

Again in the vast crowded city  
I wander midst sorrow and care,  
No rapture, no heart-feeling pity,  
Is voiced in the still atmosphere.  
A youth guides the way to the mountain,  
Then points to a gentler slope,  
And sighs, "There's the grave of life's fountain,  
And there sleep the pleasures of hope."

Thus through me the dreams are revolving,  
Each moment another recalls,  
And the pictures so often dissolving  
Life paints in my cloistered halls.  
And the song in Æolian measures,  
The nautilus' lullaby seems,  
While nations and oceans bring treasures  
To soften and sweeten my dreams.

NEW YORK, March 21, 1881.

FESTUS.

#### IV.

PATRICK J. M'MAHON.

Mr. P. J. McMahon, although a truly representative American telegrapher, was born in Ireland, February 4th, 1848. He arrived in Boston with his parents in the autumn of the same year, and has since resided in New England, receiving his education in the Boston public schools. In 1863 young McMahon entered the telegraphic service as a messenger boy for the Vermont and Boston company, and, like most of our leading telegraphers, the messenger

boy, after speedily blossoming forth as an expert operator, shines to-day among the leading spirits of American telegraphy. At the time of the consolidation of the Western Union, American and Vermont and Boston companies, young McMahon was transferred to the Western Union office as clerk. He was soon afterward given a position as operator, and rapidly rose to the

and Stewart, all wonderfully fast senders, and the incomparable operators at the "drop" stations on that line—Baltimore, Philadelphia and New York. All agree that no more even-tempered and skillful operator ever touched a key. Again, in 1872, during the Grant convention, in Philadelphia, and during the Centennial pressure, in 1876, Mr. McMahon won golden opinions

PATRICK J. McMAHON.

front rank in the service, becoming renowned for his splendid "copy," and good work generally. The five years from 1872 to 1877 he spent on the Boston night force—probably one of the most trying telegraphic positions in the country—working the Washington "special" wire. During that time his method of working was the admiration of all who witnessed or heard it, and evoked frequent commendations from Manager Marean and Messrs. Austin, Fred. Marean, Hotchkiss

and laurels for himself both as an expert operator and a cultured gentleman. To-day he is without a superior as a telegraphist, although his wonderful abilities are partly thrown away on the Portland duplex.

Socially, Mr. McMahon is of a kind-hearted and extremely liberal disposition, a great favorite with those who come in contact with him, and is well known throughout the country. He has repeatedly refused tempting offers to go

elsewhere, seeming to believe that Boston is the only good place in the world to live in; and, being married now, he appears determined to remain there during the remainder of his life.

Unlike many telegraphers, Mr. McMahon has remained always close to home, appearing to regard it with all the fervency of his nature. Yet he enjoys travel and recreation in a rational manner, spending his customary month of summer vacation in the wilds of Northeastern Maine, in pursuit of the bounding deer, the stately moose and the silvery salmon. During the autumn and winter months his leisure time is said to be mainly occupied in vain endeavors to convince his office associates of the blessings which are to follow the success of the Greenback party in the nation.

Mr. McMahon has all the outward appearances of being extremely modest and retiring, but those who have heard him relate his wonderful achievements with the rod and rifle in the streams and woods of Maine, far from the correcting influence of the telegraph, with a furlough in his pocket, may possibly doubt the accuracy of this inference.

It is an old saying that what everybody says must be true; so that, in view of the general approbation, we have no fear in putting forth Mr. McMahon as a worthy representative of the very worthy telegraphers of New England.

#### Progress of the Consolidation and the Opposition Thereto.

On March 16 Mr. Rufus Hatch made a new attempt to defeat consolidation, based on the principles involved in the Williams suit, with which all readers of THE OPERATOR must be familiar. Mr. Hatch's new suit is against the three telegraph companies, the Union Trust Company and the directors of the Western Union Company, individually. As a stockholder of the Western Union Company, he says he does not choose to be bound by the acts of the directors and other stockholders of that corporation when such acts are clearly illegal, and he considers the purchase by the Western Union of the property of the other two corporations to have been "premature, erroneous, irregular, illegal and void," in that no authority was given to the directors of the Western Union by the stockholders to enter into the agreement of Jan. 19, and that the majority of the trustees and stockholders of the American Union Company had no authority to sell its property to the Western Union Company on credit, as they did. Finally, Mr. Hatch complains that it is the intention of the Western Union Company to pay a quarterly dividend of  $1\frac{1}{2}$  per cent. upon the capital stock of \$80,000,000, in defiance of the order of the court. He asks a perpetual injunction restraining the four defendant corporations from doing any act under the agreement of Jan. 19, 1881, and that the individual defendants, the Directors of the Western Union, be compelled to pay any losses which have resulted or may result to the company through that agreement. A temporary injunction was granted returnable on the 18th ult.

On that date the case was resumed, and almost interminable legal arguments followed, one side demonstrating to its own satisfaction that Rufus Hatch bought 100 shares of American Union stock one day prior to that on which the agreement of consolidation was entered into by the three telegraph companies, and with full knowledge that the agreement was in contemplation; that his suit was brought for stock-jobbing pur-

poses; that he was inspired by unworthy motives in his litigation, and had said he would withdraw all his opposition to the consolidation of the companies if his American Union stock were bought from him at the price of Western Union; while, on the other hand, the opposing counsel showed that the consolidation was little less than public robbery.

During the progress of this argument Mr. Hatch, on the 19th ult., began a new suit—suit number three. This was brought in the Superior Court, the principal defendants this time being the American Union Telegraph Company and its directors. The Western Union and Atlantic & Pacific companies and the Union Trust Company are joined as defendants. He brings this suit as the owner of 100 shares of American Union stock. His complaint is almost identical with that in the suit in the same court in which he sues as stockholder of the Western Union Company.

In addition to the Hatch suit, the Compagnie Française du Télégraphe de Paris à New York (better known as the French Cable Co.) has renewed the struggle to prevent the consolidation of the land lines. On the 14th ult., this company filed in the United States Circuit Court a re-amended bill of complaint against the Western Union, American Union, and Atlantic & Pacific Telegraph Companies, and the Union Trust Company.

The cable company asks that the consolidation of the land line companies be declared null and void; that the contract of Dec. 18, between the American Union, and Jay Gould and his associates, be also declared null and void; that all leases of wires or transfers of property between the companies be enjoined, and that the American Union be enjoined from discontinuing the interchange and transfer of messages under its original contract with the complainant.

On the 26th ult., "the Williams suit" came up before Judge Speir, on motion for an order to show cause why the defendant companies should not be punished for contempt in violating the injunction order of Judge Sedgwick. Judge Speir named March 30 for hearing argument on the dissolution of the injunction. Motion for contempt was then argued at great length, and upon its conclusion Judge Speir took the papers and reserved his decision.

Meanwhile the enemies of monopoly have not been idle.

The Produce, Cotton and Petroleum exchanges have prepared a circular to be sent to similar organizations throughout the country in relation to the formation of a telegraph company which cannot be bought out or absorbed. It says:

"To this end we advocate the creation of a new telegraph company, whose constitution shall embrace such provisions and conditions as will preclude its consolidation or absorption by any rival interest.

"We propose, therefore, that the voting power on over one-half of its stock shall be permanently vested in a board of trustees, of whom a majority shall be selected from among the presidents of such commercial associations or exchanges as shall be hereafter designated, and who shall be ex-officio members of the said board.

"This plan of trusteeship will, it is believed, prove an effectual barrier against any effort to subvert the company we propose to create by any act or plan alien to its interests, or foreign to the purposes herein set forth.

"It is believed that \$10,000,000 properly expended will give us ultimately as perfect a system of telegraphy as that now represented by \$80,000,000."

In the Pennsylvania Senate, on the 24th ult., the bill to escheat to the Commonwealth telegraph lines which shall consolidate was advanced to a third reading. The character of the measure is fairly indicated by its title: "An act to escheat to the Commonwealth the telegraph lines and property of telegraph corporations, associations and companies which violate the provisions of the Constitution prohibiting the consolidation with, or the holding of a controlling interest in, the stock or bonds of a competing line of telegraph, or the acquisition by purchase, or otherwise, of any other competing line of telegraph." The bill has not yet been considered in the House.

The Legislature of Connecticut has incorporated the "International Construction Company," with somewhat sweeping powers. It proposes to build the international railway to the city of Mexico. The act of incorporation empowers it "to build, construct, enlarge, repair, complete, equip, furnish, and operate, etc., railroads, railroad bridges, telegraph lines, and all necessary appurtenances in any State or Territory of the United States, or in any foreign country," with power to lease other roads or telegraph lines; "to make joint stock with any other corporation; to receive in payment cash, notes, bonds, stocks, or other securities, from any individuals or corporations, and securities issued by any government, state, county, town, or municipal corporation;" to construct or operate roads "by contract or otherwise; to own and operate steamship lines, steamboat lines and ferry-boats; to borrow and loan money, issue its own bonds, etc., at rates of interest not exceeding 8 per cent.; to make advances of money to railroad, telegraph and bridge companies and other corporations, and to contractors and individuals." The capital stock is to be \$1,000,000, liable to be increased to \$10,000,000.

Another incorporation of a national character which is asking, and will, doubtless, obtain a Connecticut charter, is a Rapid Construction Company, having among its incorporators Marshall Jewell, Alexander H. Rice, Benjamin H. Bristow, E. S. Converse and Thomas Wallace. The capital stock is \$1,000,000, with power to increase to \$6,000,000, and organization can be made when \$500,000 has been subscribed and \$50,000 paid in. The company is for the purpose of building and operating telegraph and telephone lines, and its incorporators are chiefly interested in the American Rapid Telegraph Company.

A rumor has gained wide circulation within the past few days, to the effect that Mr. William H. Vanderbilt was about to organize an opposition telegraph company, with a capital of \$25,000,000, and with Gen. Anson Stager, formerly Vice-President of the Western Union, at its head. There is certainly room for such a concern, with so experienced a head as Gen. Stager, not to speak of many other able officers who have recently resigned from the Western Union, but the rumor is strenuously denied in official quarters. President Green, of the Western Union, said that he could confidently deny that there was any foundation for the reports, and, on Monday last, Mr. Cornelius Vanderbilt said that if there was any connection between the report that \$25,000,000 has been raised to start a telegraph company and the fact of Mr. William H. Vanderbilt's resignation from the directory of the Western Union Telegraph Company, he did not know of it.

Meanwhile the consolidated company has been quietly closing its superfluous offices, the reduction of force falling upon the executive department as heavily as upon the working operators.

Many of the operators in this city, however, have been provided with places in the offices of private bankers, who are very generally leasing wires for their exclusive use to Philadelphia and other near-by cities, and in some instances to the far West.

It is said that a delegation of operators called upon Gen. Eckert last Saturday, and requested him to enlighten them as to his intentions in their regard. He answered in a speech in which he said that undoubtedly he would be compelled to make some reductions, but that good operators need have no fear of remaining long out of places in these times. With this very general information they were obliged to be content.

It is pretty certain now that the American Union main office in this city will remain open for the present, but the Atlantic & Pacific building has already been leased to an insurance company, who will occupy it on the 1st of May.

Some cavalymen near the Cape of Good Hope were in a heavy thunderstorm. A flash of lightning flung seventeen horses with their riders to the ground, killing ten men and five horses on the spot. Those who were not killed were all seriously injured, and it was long before animation could be restored in the case of seven of the men. All the bits and stirrup-irons were blackened, and many of the men, though personally uninjured, had their clothing rent by the force of the electric discharge.

### An Able Paper on the Telegraph Monopoly.

Hon. William M. Springer, M. C., has contributed an article to the *North American Review* on "The Telegraph Monopoly," which, on the whole, makes out a strong case against the consolidation. The following is a synopsis of the article:

In the brief space of thirty years, Mr. Springer begins, the telegraphs of the world have grown to nearly half a million miles of line and more than a million miles of wire, or a length equal to forty circuits of the earth.

In the principal governments of the world, except the United States, the telegraph is a part of the postal system, but in this country private corporations construct and control all telegraph lines. The Western Union Telegraph Company, however, has absorbed other companies, until at this time it has the whole telegraphic system of the United States in its exclusive control, with a few unimportant exceptions.

The distinguished writer then traces the history of the Western Union Company, and its growth, step by step, until its capital stock has reached \$80,000,000. He says that the issuing of scrip or stock dividends has constituted one of the chief features of its corporate management. Scrip dividends have been declared to the amount of over four hundred per cent. of its capital at one time. A careful examination of the history of the company will show that, prior to the recent consolidation, of a capital stock nominally amounting to \$41,000,000, over \$26,000,000 was the product of scrip dividends; the remainder, \$15,000,000, represents the money actually invested. But now a nominal capital of \$80,000,000 has been created, and dividends upon this enormous inflation will be exacted from the business of the country for all time to come. The people are naturally concerned as to what may be their rights in the premises. Judging the future by the past, we have no assurance that watering stock and absorbing rival companies are to cease. If there were any ground for hope that the present consolidation would be the last of its kind, we might with some approximation to exactitude compute the result and the effect upon the future business of the country. Eighty million dollars of stock, upon which future dividends are to be paid of at least eight per centum per annum, would require \$6,400,000 annually to supply the demand. The \$20,000,000 actually invested might, properly managed, earn eight per centum per annum, or \$1,600,000. Hence the profit to be exacted from watered stock by this company amounts to \$4,800,000 every year. This tax, thus levied upon and exacted from the business of this country by the Western Union Company, upon this fictitious stock, is equal to a permanent debt of \$150,000,000 of three per centum Government bonds.

Various means of relief have been suggested; some of them deserve to be carefully considered.

*First.* The regulation by the States and by the general government of the rates to be charged for the transmission of messages. *Second.* That Congress should authorize the construction of telegraph lines at the government expense to be operated in connection with the Post-office Department, leaving the lines now owned by corporations to be managed by them in their own way. *Third.* That Congress should aid some private corporation, and form a kind of government co-partnership with it, by means of which, without any appropriation of public funds, individual enterprise could be successfully intrusted with the telegraphic business of the country at greatly reduced rates, without the possibility of expense to the government. *Fourth.* Providing for the purchase of existing lines, and their ownership by the Government, and the operation and extension of the system hereafter under exclusive Government control.

With regard to the latter plan, Mr. Springer intimates that if the necessary appraisal of

the property is exorbitant, it will be impossible to get a bill through Congress to pay the companies their price. It must not be assumed that the Government will be under any obligation to purchase the property at the appraised value. If the appraisers should so far forget the responsibilities of their position as to fix the value at an unreasonable amount, the appraisal would only serve to defeat the purchase of existing lines, and the Government might then proceed to establish lines of its own, and the extension of lines could be prosecuted with as great rapidity as the appropriations made by Congress would authorize. This would force the existing companies into competition with the Government lines, and compel them to adjust their rates according to the Government standard.

He then produces figures to demonstrate that a Government telegraphic system can be made self sustaining at rates materially less than those charged by private companies, alleging in this connection that in England, for the ten years of Government control, the receipts have exceeded the expenditures nearly \$10,000,000, not including the value of the service performed for the Government.

With a Government system in this country, we might reasonably expect a reduction of rates to not exceeding twenty cents for twenty words to any part of the United States and the territories, a large increase in the number of offices, and an enormous increase in the number of messages. How long the people will forego such benefits, and permit the exactions and extortion of private companies, remains to be seen. The commercial and social benefits to the people which would immediately follow increased telegraphic communication at reasonable rates, in a country of the vast extent of our own, can scarcely be estimated. The press of the country is especially interested in securing increased facilities for the transmission of news. Under a Government system, private wires might be rented both to the Associated Press, and to newspaper publishers whose business would justify it, at rates which would merely reimburse the Government for the cost of constructing and maintaining the press wires, in connection with other Government wires upon the same lines. Boards of trade could also secure the separate use of wires connecting the principal cities of the Union; and all classes of people, both for social and business purposes, could obtain telegraph facilities at reasonable rates.

In conclusion, he considers the argument against a Government monopoly which points to the appalling power which such a system would give to the Federal Government, and the certainty that the telegraph would then be used as an engine of political oppression. Mr. Springer thinks that these evils could be counteracted by providing a Government system so carefully framed as not only to secure a telegraphic service conducted upon strictly business principles, but also to free the postal service from the control of politicians, and place the whole business under non-partisan management, free from the exigencies of party.

### Gray's Harmonic System.

At the regular semi-monthly meeting of the New York Electrical Society, on Wednesday evening, March 16, the society accepted the offer of the trustees of the Cooper Union and agreed in future to meet at the Geographical room of the Cooper Union, on the first and third Thursdays in each month (instead of the first and third Wednesdays as previously decided upon). The Cooper Union very generously gives the society the use of this room two evenings a month at the bare cost of lighting.

The routine business having been disposed of, Mr. F. W. Cushing, who was one of the most active in the organization of the society, delivered an interesting lecture on Gray's Harmonic System, of which the following is a very full synopsis:

Before attempting a description of Gray's Harmonic Telegraph, which, as its name implies, has much to do with the phenomenon of sound, a few words on the simpler laws of acoustics will not be out of place.

If two bodies are brought suddenly together, every ear in the room receives a shock, to which the name of sound is given. The molecules composing the bodies are set into vibration, and the vibrations, acting upon the air with which they are in contact, produce air waves which travel out in all directions and finally reach the ear, producing upon the mind the sensation which we call sound. If a body is caused to vibrate, each vibration sends out an air wave, and a continuous sound, called a tone, is produced. When these vibrations are slow the waves are comparatively far apart, and the tone is a low one. When they are rapid the waves are closer together, and the tone is higher. Every body that can be made to vibrate has its fundamental tone; that is to say, it can move just so fast and no faster. The amplitude of its vibrations may be made greater, but this will only increase the volume of sound without altering the pitch. As an illustration, take a weight suspended by a piece of string. Move it from its position of rest an inch to the right; when it is released it will swing back to and, having received an impetus from the force of gravity, nearly an inch to the left of its original position. Then move it three inches to the right. When released it will swing nearly three inches to the left. Next time start it from a position a foot to the right, and it will swing nearly a foot to the left. Each of these swings of one, three and twelve inches will occupy precisely the same time, and if the string were a solid body with one end fixed and the other vibrating with an amplitude of one, three or twelve inches, the same number of air waves per second would be sent out in each case and the same note produced, but the volume of sound would be greater with the greater amplitudes.

These air waves are not only recognized by the human ear but by any body having the same fundamental tone that they come in contact with and that is free to vibrate. Professor Gray illustrates this by standing two tuning forks of the same tone near each other and causing one to vibrate for a few moments. Upon raising it, the other fork will be found to be vibrating also. The first wave strikes the nearest prong of the second fork and pushes it a little out of place, when its elasticity carries it back to and a little beyond its original position just in time to meet the second wave, when the former operation is repeated and the vibratory motion is sustained as long as the air waves last. If, however, the forks have not the same fundamental tone, the second fork will not vibrate, because when the prong of the second fork is displaced by the first air wave and flies back, the second wave comes along either too soon or too late to take advantage of the motion communicated by its predecessor and its effect is lost. Hence, in order to communicate vibrations from one reed to another by means of air waves, both must be tuned to the same note.

In transmitting vibrations through a wire by means of waves of electricity, these general rules must be observed. At the sending end of the wire a reed is set into vibration, and each of its swings is made to send a wave of electricity over the wire. These waves, reaching the receiving end, pass around the cores of an ordinary electro-magnet which has for an armature another reed with the same fundamental tone as the first one. Each pulsation of current magnetizes the soft iron core, which, in turn, attracts the reed and draws it out of place; then the current is broken, the core is demagnetized and the reed, being set free, flies back to, and on account of its elasticity, a little beyond its position of rest, when it is again attracted by another wave of current and the motion repeats itself as long as the current waves last. If the vibrator at the sending end be thrown in and out of circuit, the reed at the receiving end will start and stop exactly in accordance with it, and telegraphic signals may be transmitted, being received in the form of musical notes, a short note forming a dot and a long one a dash.

A very ingenious device has been invented by Professor Gray to reduce these notes again into Morse characters upon an ordinary sounder. A small bar of metal, called a rider, is balanced upon a supporting piece, and has one end resting upon the receiving reed. A light adjusting spring is attached to the rider. One pole of a local circuit, containing a sounder, is attached to the reed and the other pole to the rider. When

the reed vibrates the rider trembles upon it and makes the connection in the local circuit so poor that the sounder opens; the instant the reed stops vibrating, the adjusting screw pulls the rider firmly down upon it, restores the circuit and the sounder closes. So that when the sending key is open, it being so arranged that the vibrator is then to line, the receiving reed is in motion and the receiving sounder is open; close the sending key, the vibrator is thrown out, the receiving reed becomes quiet and the sounder closes, producing the same effect as in sending over a single wire with ordinary Morse apparatus. It may seem incredible that all these arrangements should work so nicely together as to allow of rapid transmission, but at a recent test of five hours between New York and Boston, 376 messages were actually sent over one tone, being an average of over 75 per hour, and probably the fastest time ever made on a Morse circuit where ordinary business was handled.

As operated at present, four vibrators with different fundamental tones are placed at the sending end, and four receivers, so tuned that each will equal one of the vibrators in tone at the receiving end of the wire, and the four series of vibrations are transmitted simultaneously, each receiver responding only to its own sender. Thus, we have four messages going in the same direction over one wire, and at the same time. In order to break, resistance is thrown in and out by the opening and closing of a key at the receiving end, which throws a relay that has been adjusted over the tone current at the opposite end out of adjustment and records the signals. All the receiving operators use the same break key without confusion.

Professor Gray has transmitted as many as eight tones at once, but the margin between them was so small and such very delicate adjustment was necessary that, for practical work, he adopted four tones only, and so developed the principle into the present Harmonic System.

The following diagrams and explanations will assist the reader in more thoroughly understanding the principle of the Harmonic System:

#### THE VIBRATOR.

The electro-magnets, *A* and *B*, have coils of 80 and 5 ohms of resistance, respectively. When the current leaves + pole of the battery and magnetizes *A*, the reed is drawn to the right and closes the contact points, *C D*. The current is then shunted around *A*, increasing the power of *B*, and the reed is drawn to the left, closing the contact points, *E F*—which are arranged to send a wave of current to the line at each contact—

when the former action is repeated and the reed is in a state of vibration. The speed of the vibrations is governed by the fundamental of the reed.

#### RECEIVING APPARATUS.

When the reed in the receiving relay is in a state of vibration, caused by the action of the incoming waves of current, the local circuit, in which is included the reed and rider, becomes so imperfect (caused by the rider's trembling) that the sounder opens. When the reed returns to a

state of rest the contact becomes perfect and the sounder closes.

The break key, when not in use, is left open, forcing the current to travel through about 3,000

ohms of resistance (or more, according to the length of the line) to find a ground. When the key is depressed, the current takes a new route of no resistance to ground, and the current is sufficiently increased, by having so much less resistance to encounter, that the magnet of the break relay, at the sending station, overcomes the tension of its armature spring and closes, recording the signals made upon the key at the receiving station.

#### SENDING APPARATUS.

When the reed swings to the left the battery is short-circuited through the transmitter lever,

lower spring and contact points. When to the right the metallic circuit is broken and + pole finds ground at the home, and — pole through the line at the distant station. Instead of actually opening and closing the battery, the action of the vibrator only reduces its strength about 60 per cent., and, as it is necessary that the same amount of current should always be to line to allow of the break relays being adjusted over it, the points are so arranged that when the transmitter is closed, cutting off the vibrator, the upper spring and point come into contact and throw about 40 per cent. of steady current to line. So that, whether the key be open or closed, the same battery strength is always going to line. When the key is open it is being sent in pulsations (too close together to affect a Morse relay), and when the key is closed it is being sent steadily.

#### New Publications.

##### THE BOSTON TELEGRAM.

New England is to be congratulated upon the possession, at last, of a representative telegraphic journal; the only wonder being that, as nearly every other section of our great country has essayed such a publication, Boston—of all places in the world—should have hesitated so long. In a profession like ours, which embraces so much that is intellectual and refined, there is need for some easy method of intercommunication and some cheap vehicle for the general diffusion of electrical knowledge. This has been apparent from the multiplicity of telegraphic journals which have literally "broken out" from time to time all over the country, and which have failed only from a lack of money; thus proving that, from the earliest days of the telegraph, our professional thought has been struggling for expression, while our professional income has not been

ample enough to admit of more than one oracle at a time. As, to use an old illustration, the children of Israel sang the songs of their captivity by the waters of Babylon, and embalmed their history in verse and melody; as the wandering troubadour, at a later date, spread the news from village to village, to the accompaniment of a lute, so have we in modern times sought to record our sorrows and joys, our triumphs and defeats, and our wonderful progress, for the enlightenment and guidance of those who may come after us. The result has been a series of class papers, excellent in themselves; but, to speak by the record, wofully disastrous to their originators.

In olden times—if we may use that expression in connection with so modern an affair as the telegraph—nearly every practical worker had a conviction away down in his telegraphic soul that he could edit a professional newspaper, providing that he could, as Trollope says, command a table and chair, a box of pens and ream or two of paper. The writing of the matter to be published was all right, but it was speedily found that "writing" checks to pay the printer's bill and the stationer's bill was where the real pinch came in. This kind of experience developed the remarkable theory that, as a rule, it took at least three men to run a telegraphic paper—one to do the writing and editing, one to owe all the money, and a third to wind up its affairs. The last named, being the undertaker, by virtue of his high office, is the final and sole representative; number one usually dying exceedingly young, and number two generally emigrating to some distant clime where sheriff's writs are unknown.

But in later years there came a change, and telegraphers demanded reading matter which had something more than the dry legal precision, soberness and monotony of an extended affidavit. The light and springy Jefferson Bricks of the telegraph—to borrow an appropriate name from that insufferable snob and toady, Charles Dickens—found their occupation gone. As might be expected, the demand brought forth an ample supply, and such cultured and entertaining writers as James D. Reid, James N. Ashley, Frank L. Pope, Fred. Grace and Ralph W. Pope, came upon the literary field—men who realized fully that the day had passed when, as with the old system of mining, a man could profit by bringing the ore to market fresh from the mines—gold, mud, rock and all—shoveling it in pell-mell. The profession demanded that the dross be well sifted. It was found necessary to keep the ever-changing record of events as the geographer and explorer traces and maps out for future travelers the course of a river. The fact was recognized that a first-class telegraphic paper could not be made by one man, and that it must be the work of an organization as complete and thorough in its way as a great telegraph company, with its ramifications extending all over and far beyond the continent; that many busy hands and heads must be forever working, collecting, arranging and publishing our contemporary history; formulizing and analyzing it, and generalizing upon it; that the successful editor must never be wrong in his data; that he must possess matured powers, a subtle perception of the needs and necessities of the craft, and a wide knowledge of mankind in general; and that it must all be presented in graceful diction. In answer to this popular craving for a suitable outlet for our overflowing thoughts, New York, Philadelphia, Chicago, Cincinnati, St. Louis and Bolivar (Tenn.) have all issued telegraphic papers from time to time. All have lived their day, written their names in sand and passed away, and of all of them only THE OPERATOR, now in its green old age, remains. Now, since the various sections of the country just mentioned have been duly interested, in a journalistic sense, it is only fair that New Eng-

land should make her maiden effort, which she has lately done, and done well, as she does everything else. The name of the new journal is the *Boston Telegram*.

Its initial number, dated March 1, although it appeared three weeks behind time, and much of its matter was dated January and February—fully comes up otherwise to all the requirements of a first-class telegraphic journal. It is to be published semi-monthly by the Noble Brothers, one of whom—Thomas C. Noble, Jr.—is a well-known writer; and it is edited by Mr. Joseph Nash. The reading matter, albeit a trifle old, is in the best taste, and its typographical appearance is good. The Intelligent Composers' errors, which occur on almost every page, are excusable, inasmuch as there is positively no remedy and no redress; but it is unfortunate that twice in the same article the *Telegram* should speak of "Greil" Eckert, a double dose of an outlandish appellation which will be anything but pleasing to the ex-assistant Secretary of War and the General Eckert who at present holds the telegraphs of America in the hollow of his hand. We hope that "Chops," the *alter ego* of the *Telegram*, will see to it that "Greil" Eckert is treated with more respect.

The *Telegram* is an injection into our peculiar literature, rather than an outgrowth of the same; still, we are glad to see it, since it must arouse all our dormant diligence and energy, and keep us up to the necessary point of extreme accuracy and enterprise; although its extravagant price—ten cents—may militate against its chances of success, and thus by its failure deprive us at an early stage in the proceedings of an incentive to out-do ourselves.

Our Eastern friends have undertaken a great responsibility, and we hope to see them acquit themselves in a manner creditable to American telegraphers. They have sought to create an instrument of tremendous power for good or evil; but it is a two-edged sword. They will have to learn how to guard against the protean axe-grinder, and, at the same time, to accord full honor where honor is due, while the journal must never be used as a vehicle for personalities dictated by private bickerings. They must consecrate body and brain to it and work like slaves for a small recompense, and under such circumstances we predict for them the simple word Success. When that goal is attained their income will be barely as large as William H. Vanderbilt's, or as varied as Jay Gould's, but they will have the proud consciousness of a great work grandly done. We wish the new journal much success. The address is Noble Brothers, Publishers, No. 79 Milk street, Boston, Mass. Subscription price, \$2 per annum.

#### Sparks from the Elevated.

There are employed by the Manhattan R. R. Co. of this city 133 telegraph operators, divided as follows: 20 on the 2d Ave. L.; 53 on the 3d; 40 on the 6th, and 20 on the 9th. Most of them act as ticket agents as well as operators. They are, as a rule, a good class of operators, although having little telegraphic work to perform. Their hours of duty are long and arduous, being from 11 to 15 hours per day, for which they receive the small compensation of from \$1.75 to \$2.35 per day. Our idea would be to diminish the hours and extend the pay.

We note the following changes: 2d Ave. Line.—Mr. P. J. Dunham, transferred from 1st st. South to 65th st. North, and Mr. J. Charlton from 65th st. North to 1st st. South; Mr. J. A. Chadwick, formerly night agent and operator at Franklin Square, resigned March 15. Mr. W. H. Cass, formerly employed as operator on the Northern Central of N. J., takes Mr. Chadwick's place.

3d Ave. Line.—Mr. W. H. Mayer, formerly night agent and operator at 76th st., resigned and goes westward. Mr. F. W. Woehrl, formerly with the N. Y. C. R. R., has been assigned to fill the vacancy.

Mr. A. M. Lane, formerly agent and operator at 125th st., started for Peoria, Ill., on the 23d inst., to take a position on the Peoria & Pekin Union R. R.

Mr. J. P. Cole, formerly agent and operator at Grand st., has been transferred to Grand Central Depot station, morning tour. Mr. Wm. E. Waugh has resigned and gone with the Lehigh Valley

R. R., located at Metuchen, N. J.

6th Ave. Line.—Operator and Train Clerk Mr. J. R. Dickerson, of Rector st., resigned on the 15th ult., and has accepted a position as operator with the W. U. in Jersey City. Mr. W. E. Sperling, formerly of the P. R. R., has been assigned to the vacancy. Mr. C. W. Jackson, formerly operator in train master's office, 129th st., has been appointed chief time clerk of the Transportation Department of this company. C. H. Stebbins, formerly with the N. Y. & N. E. R. R., has accepted a position with this company, and assumes his duties to-day, April 1st. Mr. Wm. M. Hoag, formerly with the N. Y. C. R. R., has recently accepted a position with this company, and has been assigned to the extra list. Mr. Henry S. Smith, who is now employed as operator in the train master's office at 129th st., is again making his usually good copy. Mr. Smith (until his recent appointment) had been out of the business for seven years. Mr. S. S. Ketchum, formerly with the W. U., this city, is occupying a position as operator in Supt. Green's office, No. 4 Front st. Mr. W. S. June, formerly operator and ticket agent at 34th st., East River, is now filling a position in Supt. Green's office. We are sorry to hear that Mr. M. E. Wines, agent and operator at 14th st. and 3d ave., is quite ill, having been confined to his room by a severe attack of rheumatism.

#### Improvement in Telephone and Telegraph Lines.

Mr. T. G. Ellsworth, manager of the John street office of the Metropolitan Telephone and Telegraph Company, New York City, has invented an elevated support for telegraph and telephone wires in large cities. From the annexed engraving—for the use of which we are indebted to the *Scientific American*—it will be clearly seen that everything possible has been done to remove all objectionable features, and to add to it a combination of many useful and improved appliances which tend to make the whole structure ornamental to the streets.

Telegraph wires are fast becoming objectionable to the public, on account of the unsightly poles on the streets and the awkward fixtures on the house-tops; the space they occupy and the cost of construction and maintenance on the part of the different companies, is becoming burdensome.

Since the telephone has been so universally adopted, the wires in many localities form a perfect network. Interruptions have occurred, at the most important part of the day, on thirty or more lines by the breaking of a single wire. The great value of telegraphic and telephonic communication lies in uninterrupted service, and any means that will insure this and cheapen the present rates will increase both the number of telegraph messages and telephone subscribers.

The particular tube shown in the engraving has been selected from many desirable forms to illustrate this invention. Inside the tube are arranged a number of shelves for supporting the cables, which are marked at a suitable distance by the number of each being woven in the covering. At each street crossing is located an electric light, its support being a part of the structure. At proper distances are letter boxes arranged for the attachment of a pneumatic tube for collecting the letters, or they may be collected in the usual way by carriers. Electric clocks are located at desired points, indicating London, Paris, China and New York time. Police time detectors form a part of this system, each policeman to signal to the station at intervals while on beat. By this arrangement a patrolman is in constant communication with the station. Fire-alarm boxes are placed at suitable distances in combination with the improved system. Ambulance boxes are also provided for signaling ambulances, etc. Drinking fountains and the like are distributed at different points. These attachments constitute some of the uses which can be made of the structure. The columns, being hollow, admit of cables passing unseen underground to buildings wherever desired, or special tubes can be arranged for conveyance above ground.

Mr. Ellsworth, the inventor of the above system, was engaged for eight years prior to 1872 in the manufacture of all kinds of telegraph in-

struments. During the great storm of 1874 he was an inspector in the Gold and Stock Telegraph Company, of which General Marshal Leferts was President, and was in charge of line-

men rebuilding the wires in his district. This invention seems to be one that has suggested itself after a long and varied experience in dealing with city lines.

#### A Simple Experiment.

To the Editor of *The Operator*:

Sir: It sometimes happens that young experimenters find that a magnet of high resistance (fine wire) will not work in the particular circuit in which they are trying it. There is a very easy way to make it work; namely, to reduce its resistance one-half. The manner of doing this may be of interest enough to show to the readers of your valuable paper:

USUAL FORM.

AS CHANGED

I. H. FARNHAM,  
Managing Electrician Bell Telephone Co.  
PORTLAND, Maine, March 3, 1881.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, APRIL 1, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

## NOTICE.

Our representative, MR. J. R. CALDER, expects to leave New York for Chicago to-morrow evening, April 2, on the business of this paper. In addition to representing *THE OPERATOR* at the Telephone Convention, Mr. Calder will also during the trip look after our interests among telegraphers and others, in the matter of both subscriptions and advertisements.

## THE COURSE OF THE OPERATOR.

Several of our esteemed correspondents have recently complained, in a rather oracular manner, of the moderate tone pervading our reports of the Consolidation, and one particularly censorious friend flippantly inquires if we have "sold out" to the Western Union. The latter absurdity requires no reply. We have occasionally explained that this journal always was and is now endeavoring to reflect, and not to shape or lead, the intelligent and popular opinion of the telegraphic profession. The record of *THE OPERATOR* must prove this. We have struck at frauds and shams wherever found; we have praised where praise was warrantable; we have opposed oppression until relief came to the oppressed; we have surrendered unlimited space to the widow and the orphan when their cause needed ventilating, and we have bitterly opposed Monopoly until opposition was no longer effective, and remonstrance, being useless, was in danger of descending to the level of rank abuse. We have endeavored to exemplify the operator himself, in the possession of the great common sense qualities—"the courage to fight, the grace to yield or the sense to run away"—each in its proper place. We have deemed it the limit of our duty to find out the truth, and to place it before our readers in a clear and truthful manner, leaving them to draw their own conclusions. This much we have done faithfully and with extreme caution, and by night and by day, with the deepest sense of loyalty and responsibility. That this course has been a true reflex of the thought, opinions and wishes of the vast majority of our intellectual fraternity, we have no reason to doubt. We should not be expected to consider seriously complaints of a purely selfish or emotional nature, written in a petulant spirit, nor to model the operators' organ upon any erratic programme exuded from the glowing fancies of men whose minds are induced

at present by the most powerful incentives to be selfish and unreasonable.

We never lose sight of the established fact that telegraph companies generally are not given to any such amiable weakness as inquiring strictly into the morality of any new scheme which might bring money into their coffers. But when we have it from the highest authority that sweeping reforms are to be inaugurated, and that an era of good will and prosperity is at hand, are we to refuse to do our share toward promoting that end? May we not suspend criticism for a reasonable time, and ascertain definitely whether we are clutching at ropes of sand or not? Our great telegraph bosses, healthy and wealthy, though perhaps not over-wise, appear to have cared very little hitherto for the opinions of the great mass of operators; but they may have read lately of the Roman victor in his chariot, driving over the prostrate bodies of his foes, who was always accompanied by a slave to whisper continually in his ear that he, too, was mortal. Maybe our modern Conquerors were about to listen, and since we know that they are encouraging moderate and fair discussion, why should we not, for a time at least, ride in the chariot with them and whisper the good word?

Times are changing. We have at the present time the rapid building of new lines, the multiplying of the capacity of the old lines by recent inventions and the steady increase in traffic, all finding work for more operators. It may be borne in mind with advantage that all men are not gifted with practical minds, and many are therefore unable to appreciate or make allowance for the many difficulties which present themselves in the government of a great enterprise. Reforms need time, great patience and forbearance on the part of all concerned and gradually liberal methods. All good things cannot be obtained in a day. That is a good doctrine which teaches us to treat all our enemies as if they might one day be friends, and all our friends as if they might one day be enemies. A kind word goes a long way; it is the curse that makes the chasm. Of all men in the world, telegraph operators can least afford to encourage the outrageous doctrine that "they should take who have the power, and they should keep who can."

If, then, *THE OPERATOR* has not truly reflected the sentiment of the majority of our profession, we should like to hear from our brethren on that point. Meanwhile, *THE OPERATOR* will do nothing to mar a good understanding between employer and employé, never forgetting that the more fruitful we make the ground in the Spring the greater will be the harvest in the Autumn. We believe that dissension can do no good at present, and that the best interests of the profession are to be served now by patience and toleration, counseled by operators ripe in sober manhood; a due respect for vested rights and a strict observance of the ordinary rules of fair play. The Consolidation is inevitable—we can't kick against that—and, if there is anything in human promises, the lot of operators ought to be no worse through it.

THE 10th inst. is an anniversary which, like that of the Battle of New Orleans, teaches what a great advantage the telegraph is as a life-saving power in war time. Sixty-seven years ago, March 30, 1814, Paris capitulated, and on the following day the allied armies entered the city; Bonaparte announced his willingness to abdicate

and retired to Fontainebleau; a provisional government was established, with Talleyrand at its head; and, in short, the Napoleonic wars were at an end—or should have been. But there was no telegraph in those days to carry the news instantly to the vast opposing armies in the South, so that they remained in ignorance of the turn of events, and ten days afterward—Easter Sunday, April 10, 1814—while the mounted couriers were still speeding toward the Spanish frontier, there came the shock of battle between the armies under Soult and Wellington, and 10,000—the French say 20,000—men were unnecessarily slain on the field of Toulouse. Nowadays, when the world is meshed with a million miles of telegraph wire, there can be no useless battle fought weeks after peace has been declared.

On the other hand it may be possible that the telegraph has its drawbacks. Mr. Charles Francis Adams has said that if there had been a telegraph cable under the Atlantic Ocean in 1863 war between the United States and England would have been inevitable. After the Federal marines had boarded the English steamer *Trent* and taken off the Confederate commissioners, and Lord Palmerston had sent the Guards to Canada with their bands playing "I'm off to Charleston," the interval of twenty days necessary to get a dispatch from Washington to London and return gave time for the heated passions of both nations to cool and for salutary reflections on both sides.

ABOUT four years ago this journal published a brief account, written by "Werner," of a West Philadelphia superintendent being struck by lightning; of the bolt having taken him squarely on the head, knocking him down, and of his subsequently explaining apologetically that he had been sick for two weeks, else he would not have displayed so much weakness. It was an English journal that copied that paragraph in all earnestness, characterizing it as "wonderful tenacity of life." This may explain why our esteemed scientific contemporary, the *Electrician*, in reviewing "Tales and History," is lost in Cimmerian darkness with regard to the humor therein; and, while our able contemporary is good enough to acknowledge much merit in the work, it cannot refrain from observing in its own Addisonian style that "we stolid Britains are sometimes inclined to wonder at the ease with which our cousins allow themselves to be amused." We have a great deal of respect generally for the flag that has braved a thousand years, the battle and the breeze, and much admiration for the enterprise and tact displayed by the *Electrician* in particular; but when it comes down to appreciating the fine point of a random joke, we must say that it requires a copious supply of explanatory footnotes to satisfy our jolly cousins. To aid in a better appreciation of the work, we reprint to-day two intelligent opinions of the "funny" part of "Tales and History"—one from the New York *Sun*, representing the most critical and widely circulated daily paper on this continent, and the other from the London *Design and Work*, representing the brains of England—or as little of it as is not engaged in editing the *Electrician*.

THE article by Congressman William M. Springer, of which we reprint a full synopsis on another page, is as elaborate and able a showing as can be made against the present telegraphic monopoly, and is well worthy of the attention of our readers. Mr. Springer's statement of the wholesale manner in which Western Union

stock has been "watered," and the tremendous tax on the business interests of the country which will be necessary to pay a dividend of eight per cent. on the increased capital, is a striking one; although his estimate of the present value of the telegraphic plant (\$20,000,000) is far too low, when we consider the right of way and other privileges bought and paid for, and the quadruplex, Page and other patents held by the Western Union. We rather regret that so eminent a statesman should descend to such common stock phrases as "corporate greed," in speaking of the natural race for wealth inherent in our people, and that he should complain in a communistic spirit that "two of the directors of the (W. U.) company are reputed to be worth two hundred million dollars"—a fact which can concern no honest man, except, possibly, the expectant heirs of the directors in question. Mr. Springer is solid on the postal telegraphy scheme, so far as its removal from political influence is concerned, and if it were possible to have a government monopoly based upon his idea we can see very little cause for regret at parting with an evidently odious private monopoly. We are sorry that we have not the space to reprint Mr. Springer's article in full.

THERE is a paper published in Ohio, in the interest of a certain telegraph "college," and, as the greater part of its admirable reading matter is clipped bodily from THE OPERATOR, it presents a very fine appearance. But in that part of its news which is not clipped from THE OPERATOR there is a wonderful absence of grammar and truth. In the latter respect we have to object to its sweeping statement that the salaries paid to operators vary from \$40 to \$125 per month; that "the salaries east of the Mississippi River, for night operators in intermediate offices, range from \$40 to \$65 per month, for day operators \$60 to \$75 per month, and that west of the Mississippi the salaries paid are from \$65 to \$80 and \$90 for intermediate offices, the operator in many cases getting the agency for tickets, express companies, etc." If this amateur editor desired to be fair with the students of his college, he would give a correct average of the salaries paid. The Pennsylvania Railroad pays its operators \$29 per month. The United States Government pays firemen in the navy \$29.50 per month. Now, there is an item which, if copied in the *Reporter*, would read like "blank verse" to the simple students at the Oberlin Telegraph College.

WE have a warm word of welcome for the new telegraphic paper, the *Boston Telegram*, published by the Noble Brothers, and which is noticed at greater length in another column. It is an excellent representative of American telegraphic journalism; and, hailing from New England, should speedily make a place for itself in the telegraphic world. Our youthful contemporary will soon discover that the history of telegraphic journalism is full of the misfortunes of and contumely heaped upon its ablest writers and thinkers, but having voluntarily assumed the duty of championing the rights of worthy operators, and of holding the baser element in check, we hope to see our sprightly junior contemporary stand to that duty as the soldier stands to his guns. We promise it our heartiest co-operation in anything looking to the advancement of our profession and hope, for the credit of American telegraphers, to see it maintain the high literary ability of which its initial number gives evidence.

It gives us great pleasure to announce that the amount of the Boyce fund (\$902.69) has been paid to Mrs. Amanda M. Boyce, the widow of the deceased, after a long, weary wait of nearly four years. We take it also as a compliment to THE OPERATOR, since the "managers" of the T. M. B. A., after twice procuring the rejection of the claim, had, two years ago, come out strong for a voluntary payment, and exhausted their energy when the sum of forty-one dollars was raised. Some of those managers have steadily opposed any payment since, and we were pained to observe that our esteemed contemporary, the *Journal of the Telegraph*, did no more than mention the matter in a gingerly manner. When telegraphers owe one thousand dollars, you will not find them offering forty-one dollars, if the matter is properly laid before them. We congratulate the members of the T. M. B. A. on this little act of justice to the family of a dead brother.

It is scarcely fair for Mr. Springer, in his excellent monograph on the Telegraph Monopoly, to take so much pains to show that the average cost of a message in England is only 25 cents, while it is 38 cents in the United States. England is barely larger than the State of Pennsylvania, while our system of telegraphs, in reaching across the continent, traverses 50 degrees of longitude, or about as far as from London to Teheran, in Persia; and, north and south, through 15 degrees of latitude, or as far as from the most southerly part of England to the Arctic circle. From New York to Omaha, which is not half way across the continent, it is further than from London to Rome; so that, in making comparisons, it would only be fair to compare the average rate on a message in the United States with the average rate on a message to any part of Europe, from Ireland to the Ural Mountains, and from the Mediterranean to Archangel.

It seems latterly that no great soul-stirring event can be complete without the ubiquitous telegraph operator coming prominently to the fore. It will be remembered that during the Electoral Commission excitement in 1876-7 one of the chief pacificators was Major E. A. Burke, an old operator from Texas. All eyes are now turned toward South Africa, and here again we find our professional brother acting as chief adviser. Alfred Aylward, a kind of Prime Minister and military counsellor to General Joubert, the great Boer commander, has been recognized as a telegraph operator who was formerly employed at Dublin. Hard luck seems to squeeze the telegraphers pretty tight occasionally, but you hear from them again, sooner or later.

PUTTING up telegraph lines in Senegal appears to be a trifle more hazardous than it was in New Jersey in the palmy days of the American Union, if a recent cable dispatch is correct. The French soldiers built that line to Fouta-Jallon, though with a loss of four officers and nine men killed and nine wounded. The natives, who were probably all armed with Western Union saws, lost an even hundred killed and wounded. If the English telegraphers—the Royal Engineers Telegraph Train—which sailed for Natal recently in the steamer *France*, do half as well in Natal as the French have done in Senegal, the telegraph will be greatly extended in South Africa.

THERE is something so generous, so chivalric, and, withal, so modest, in the private character of Mr. P. J. McMahon that no one can quarrel with the selection for Our National Portrait Gallery for this issue. In his professional capacity

he is too well and favorably known under the pseudonym of "Paddy Mack"—one of those easily mouth'd titles so freely bestowed by irreverent operators on their favorites—to need indorsement by us. Mr. McMahon is a fair example of the vigor and talent which are so rapidly bringing American telegraphy in advance of all the world.

THAT was a mournful story narrated to the Philadelphia Councils last week during a discussion over certain rights to be accorded to "opposition" telegraph companies. It was clearly shown that no less than nineteen telegraph companies have been successively authorized to run wires in that city, each promising a determined competition with the Western Union, and that one after another of these nineteen companies have fallen by the way-side and "consolidated," though their wires still remain.

THE misanthrope who likes to contemplate sad news may find it in our "Personals" to-day. The brief items cover a long tale of mistaken zeal, hard luck and lost hope. THE OPERATOR has nothing but its sincere regrets to offer to the old warriors struck down in the trenches where they have fought so long and so gallantly. To the man who has literally hewn his way through the world, it is hard to be turned back and to commence his excavations again, but to a strong arm and a stout heart there is little, however appalling it may appear, that is utterly impossible.

WE have to return our thanks to the telegraphers of Philadelphia for the cordial manner in which our representative, Mr. J. R. Calder, has been received in their city, and for their great interest in THE OPERATOR, which is evinced in the prompt and cheerful manner in which nearly every operator and telephone man in the good old Quaker City has supported the representative paper of our profession.

As Gray's Harmonic System is just now attracting much attention, by reason of the recent practical experiments with it between New York and Boston, Mr. Cushing's lecture, printed in this issue, deserves careful perusal. The cuts to accompany the lecture, as published, were prepared especially for THE OPERATOR, and are the first that have been made or published of the Harmonic System in its present perfection.

In this issue Messrs. J. H. Bunnell & Co. present a new and interesting page of cuts and descriptions of very handsome combination sets, made up of giant sounders, steel lever keys, sounding relays, etc., adapted for lines from a few feet to 600 miles in length. The prices are remarkably low, while the quality of the instruments is strictly first-class.

THE Chief Signal Officer is to be congratulated upon the efficiency of his bureau, which now feels confident enough to issue two-day forecasts of the weather. The Signal Service is steadily progressing.

OUR telephonic friends, and those interested in the telephone, should not forget that the telephone convention takes place in Chicago on Tuesday next, April 5.

WESTERN UNION stock is quoted at 113½; A. & P. at 47¼, and American Union not quoted. Last issue they were 116½, 48¾ and 80¾ respectively.

OWING to the large amount of interesting matter received for this issue, we find it necessary to issue a twenty-page paper to-day.

## Notes and Queries on Electricity and Electro-Magnetism and their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

BY T. D. L.

### Q. 100. What is a magneto-electric machine?

A. A magneto-electric machine may be briefly defined as "a contrivance whereby motion is transformed into electricity." They are made in many different forms, and the modifications of the machine are almost as numerous as are those of the voltaic battery. Nearly all may, however, be comprehended in three classes:

First. Those in which the working current is generated by the movement of coils of wire in the vicinity of permanent magnets.

Second. Those in which a comparatively small permanent magnet and armature are made to generate a current which is merely made use of to excite a very large electro-magnet. This is then used to induce a second current, which can be as much stronger than the first as the electro-magnet is more powerful than the permanent magnet.

Third. Those in which the small amount of residual magnetism always present in electro-magnets is utilized to generate a current, which is first used to increase the magnetism of its inducing magnet and thereby its own strength. When the current reaches the required point of strength, a portion is shunted off for use, while another portion may be directed continuously through the coils of the inducing magnet, thereby maintaining its magnetism. The Gramme machine, however, differs in principle from all others, and will be specially described.

### Q. 101. Describe a machine of the first class mentioned.

A. This class of machine is the simplest, and was long the only style in use. A pair of coils of insulated wire, containing soft iron cores connected by a yoke piece (the coils also being connected the same as an electro-magnet), are fixed on a horizontal axis and rapidly revolved in front of the poles of a permanent magnet or series of magnets. The rapid alternate approach and retreat of the coils through the magnetic field of the permanent magnet induces currents in each coil, but in opposite directions.

The wires of the coils must, therefore, be connected together and to the terminal in such a way as to cause the currents induced in one coil to flow in the same direction and time as the currents induced in the other.

When so connected the coils act with each other, and the combined current is reversed but twice in each revolution. For some purposes, such as ringing bells, these reversed currents are used just as they come from the machine; but if the current is required to be continuous, and to flow in the same direction constantly, as it necessarily must when used for lighting and similar purposes, an arrangement called a pole changer or commutator is attached to the axis of rotation and to the terminals of the coils, which brings both currents into the same direction. These latter remarks refer to all magnets or dynamo machines except the Gramme. That machine, by its peculiar construction, furnishes a constant current in one direction.

### Q. 102. What was the first improvement in magneto-machines after the invention of the machine described above?

A. The invention of the Siemens armature. It was proposed in 1857 by Dr. Werner Siemens, and consists of a cylindrical piece of soft iron hollowed out at two sides for the reception of insulated wire wound longitudinally or parallel to its axis. This is fixed on bearings in a magnet cylinder formed by the extension of the poles of the permanent or electro-magnet, which are joined together by brass or copper strips.

The Siemens armature is rapidly revolved within this chamber, and, from its position directly between the poles of the magnet, where the magnetic field is much more intense than in that occupied by the old form of armature, much more powerful currents are produced. The terminals of the wire wound round the armature are led out of the chamber and convey the current to its desired destination.

### Q. 103. Describe a machine of the second class, which illustrates the second great improvement.

A. The machine which may be regarded as the

type of the second class is that of Mr. Henry Wilde, of Manchester, England, who discovered that if the current produced by the revolving armature of a permanent magnet was made to flow through the coils of an electro-magnet, a degree of magnetism much stronger than that of the original magnet was produced by revolving the armature sufficiently fast.

Having made this discovery, it then occurred to him that an electro-magnet so excited might be used to evolve a proportionately large amount of electricity. Making a machine embodying the principle, he discovered that such was the case. The following is a description of the Wilde machine, as patented by him in 1867. A very large electro-magnet of the horseshoe pattern forms the lower and much larger part of the machine, and is fixed with its poles downward. The yoke piece joining the two electro-magnet cores is utilized as a base whereon to place a series of permanent magnets, also with the poles downward.

The permanent magnets are much smaller than the electro-magnet. Both magnets are provided with Siemens armatures, which are rapidly revolved simultaneously by the same power. The armatures rotate in what is called the magnet cylinder.

This is formed by masses of iron attached to the poles of the magnets and kept separate from each other by a brass or copper plate. These are bored out to make a cylindrical cavity.

The upper armature is rotated with a velocity of about 2,400 revolutions per minute, and the current thereby obtained is directed through the coils of the electro-magnet below. These currents maintain the electro-magnet in a state of powerful magnetization, and the currents induced in its revolving armature are much more powerful than those of the exciting magneto-machine, and are utilized in the work done external to the machine. With such a machine an iron rod fifteen inches long and one-fourth of an inch thick was melted.

### Q. 104. Describe generally the machines of the third class, which include the third great improvement.

A. The principle on which the third class of machines is based was first patented by Varley, and was subsequently re-discovered about the same time by Dr. Werner Siemens and by Sir Charles Wheatstone.

The best and most powerful machines now constructed are made on this principle; for instance, those of Ladd, Tisley, Siemens and Alteneck. The principle is also applicable to the Gramme and Brush machines, which in other respects differ from all other machines.

A description of one of the above-mentioned machines will suffice for all, as the principle of all is the same.

Ladd's machine consists of two parallel electro-magnets. A Siemens armature is placed at each end. They are, however, of different sizes. The smaller one is in circuit with the coils of the electro-magnet, and the larger one furnishes the working current. The two armatures are revolved simultaneously. The current is at first generated in the coils of the smaller armature by the residual magnetism of the electro-magnets. This armature, as it revolves, sends the currents generated in its coils through the coils of the magnet. The magnetism thus increased magnifies the currents induced in the revolving coils, and at the same time develops powerful currents in the larger armature, thus carrying on the principle of mutual accumulation. The current developed in the larger armature is utilized for the purpose desired.

## Telegraphic Tales and Telegraphic History.

*From the London Design and Work.*

In the United States the employés of the telegraph companies exhibit a good fellowship and devotion to their profession which on this side of the Atlantic, if not existent, is at any rate non-obtrusive. This feeling renders the success of a book like the present an absolute certainty, and our only regret in reading it is, that it is not written in a more cosmopolitan spirit, so as to be equally available and interesting to European readers. An English edition would, in our opinion, prove to be a great success, and would involve very little trouble in the preparation, the author having in that case simply to extend the

third chapter, and slightly modify some of the others. Probably in order to assist in the popular attractiveness of the title of the book, the history of the telegraph is relegated to the second place; but within the book itself it occupies, as it should do, the place of honor, and, notwithstanding the side-splitting mirth of some of the tales, it forms by no means the less interesting portion. The author commences with the pre-electric telegraphs, giving instances where, among uncivilized people, telegraphy by sound and by light was employed. \* \* \* The gradual development of the electric telegraph is carefully traced; and while, as might naturally be expected, the author gives full prominence to the valuable achievements of his countrymen, the labors of Europeans have by no means been overlooked. In fact, we have seldom seen so truly an impartial account of the early history of any great industry or science than has been condensed into these pages. The narration of the introduction of telegraphy into the States is of great interest.

We regret that we cannot find space for more than a few extracts from this exceedingly interesting book. \* \* \* A little fun seasons our daily toil, and the author has, in our opinion, done well to intersperse his narrative with many humorous sketches. Special applications of the telegraph are described, such as its employment in war, and for the regulation of railway traffic, and the volume very aptly concludes with a description of the outgrowths of telegraphy, including the electric light, the telephone, and electric railways.

*From the New York Sun.*

Just now, when the consolidation of the great telegraph lines has attracted so much attention, nothing could be more timely than the popular account of the electric telegraph, published by Mr. W. J. Johnston, under the title of "Telegraphic Tales." The author has chosen an effective and attractive form of exposition, being careful to illustrate the salient features, characteristic incidents, and important improvements of telegraphy by pertinent anecdotes. The result is that the book is decidedly entertaining, while, at the same time, it presents in a systematic and compact form a summary of such technical information as is useful to the general reader, and not unserviceable to the professional operator. It is seldom that a book containing so much substantial and not easily accessible material of a specific kind is commended to a wide audience by a careful and pleasing literary treatment.

In a chapter discussing the duties, qualifications, and acquired dexterities of operators and messengers, the author relates a curious incident which deserves to be noted by physicians and by all students of the phenomena of epilepsy and trance. It appears that in the winter of 1870-71 one of the operators in the Western Union office at Boston had an epileptic fit. His medical attendant spoke to him, chafed him, and made every effort to arouse him, but in vain. Subsequently one of his fellow operators drew a chair up to the bed, and took the patient's hand in his. As he did so he noticed a feeble pressure by the fingers, which pressure presently resolved itself into dots and dashes, faintly communicating to the tactile sense the words, "W-h-a-t d-o-o-c-t-o-r s-a-y a-b-o-u-t m-e?" Asked whether he could hear what was said to him, the patient signified assent by a slight motion with the tips of his fingers, and the result was that his fellow-operator got from the patient enough dots and dashes to describe his feelings to the physician, who was thus enabled to apply the necessary remedies. It is certain that no other method of communicating was possible under the circumstances, since the sufferer from epilepsy, although he could hear, could neither speak nor move any of his muscles except those situated in the digital extremities, and these only with the faintness requisite in electric communication. We concur with the author in concluding from this incident that not only persons in a trance, but those in a dying condition, would be able, if acquainted with telegraphic characters, to make known their thoughts and feelings long after any other means of communication had become impossible.

The extraordinary acuteness of the tactile sense and the precision of the sensations which it forwards to the brain are strikingly demonstrated by another of these telegraphic tales. It

is well known that what are termed first-class operators read messages, not by means of punctures in strips of paper, which are only meant for tyros, but by sound—that is to say, by the clicks of the instrument noted in connection with the varying lengths of the intervals between the taps. Of course, by practice, an operator's ear is rendered intensely sensitive, until it can catch the faintest vibrations or whisperings of his instrument. It would not be supposed, however, that this method of reading messages would suit a deaf man. Nevertheless, a deaf man can accommodate himself to these circumstances. We are told that an employé of the American Telegraph Company in Washington, although he could not hear, was rated as a first-class operator dealing with sounds. He could send and receive dispatches by the sense of feeling. He placed his leg against that of the instrument table, and read by the slight jarring communicated, revising, so to speak, the text of his sensations by keeping his eye fixed on the motions of the instrument itself. We need not point out the interest which this fact has for the advocates of the theory, according to which all the specific senses observed in the higher animals have been evolved by differentiation from the tactile sense.

One of the most amusing things in this volume is the account of a new device alleged to have been hit upon for applying electricity to railroad purposes. It is a contrivance by which the colored person employed as a porter in sleeping cars can be awakened at every station. Heretofore the somnolent tendencies of this employé have proved insuperable, except through the constant intervention of the steam whistle, to which passengers not unreasonably object. It is said that a Western inventor has adapted electricity to the purpose of an alarm signal, in such a way that the colored employé's usefulness is increased at a trifling cost. A wire runs from a battery placed in the engine, under the cars, and is connected with an electric disk in the cushion of the hind seat of the sleeping car, where the porter is accustomed to repose. At the moment when the engineer rings the bell on approaching a station, his hand lightly touches the battery, the lightning flashes to the electric disk, and a charge of electricity mending up the spinal column of the African, he is raised toward the roof of the car. When he comes down he is wide awake and ready for business.

#### The Widow's Mite.

To the Editor of The Operator:

SIR: Please extend through the columns of the operators' journal my heartfelt thanks and the thanks of my children to the telegraphers, one and all, for the noble manner in which they have responded to the call for the voluntary payment of the assessment due on my husband's death, three and a half years ago.

Although I have since met with many cruel rebuffs, I have never lost faith in the honor of my late husband's associates, and always believed that they would pay the claim sooner or later. I have sometimes entertained misgivings, but the payment comes to me at a time when I had been feeling most apprehensive for the future, so that it is doubly welcome.

While thanking the telegraphic fraternity in general, I desire especially to recognize the disinterested kindness and knightly courtesy of a few in particular. I have to thank Mr. Heber C. Robinson, of Philadelphia, for his unwavering support throughout; Mr. J. N. Ashley, Secretary of the Association, for his laborious efforts; Mr. Joseph Christie, of Philadelphia, for the patient and intelligent manner in which he arranged, classified and presented to his fellow-workers the voluminous correspondence bearing upon the case, and Mr. W. J. Johnston, of THE OPERATOR, for his persistency and tact in placing my claim before the public.

To Messrs. James D. Reid and James Merrihew, of New York; J. T. Alleyn, of New Orleans, and William Holmes, of New York, a

minority of the members of the Executive Committee of the T. M. B. A., I return my heartfelt thanks for the unanimity with which they indorsed my just claim. AMANDA M. BOYCE.

MOUNT HOLLY, N. J., March 26, 1881.

#### Suit Against the American Rapid.

J. M. Baer, an inventor in telegraphy, has begun a suit in the Supreme Court, this city, for an injunction against the American Rapid Telegraph Company. Thomas Wallace, Daniel H. Craig and Horatio G. Angle are made co-defendants in the suit, although Mr. Angle is not hostile to the plaintiff. Mr. Angle has made an affidavit in which he says that he and the three others, either as the owners or the inventors of telegraph patents, agreed to put their patent-rights together and sell them to the so-called American Rapid Telegraph Company. The company was to issue to them therefor substantially all of its 30,000 shares of stock. The directors, however, Mr. Angle avers, never issued to him and to Mr. Baer the stock belonging to them, but watered the stock from \$3,000,000 up to \$10,000,000, and sold some of it for \$40 a share. Mr. Angle charges that the directors have expended only \$2,500,000 in building three wires from Boston to Washington by way of New York, and in purchasing \$400,000 in apparatus; that they are about to extend the lines by connecting Chicago with Philadelphia and New York by means derived from the sale of the watered stock, but without giving to Messrs. Baer and Angle their shares. They ask, therefore, that a receiver be appointed for the company, and that it be enjoined from carrying out the plans proposed. Decision reserved.

#### Telegraphers' Aid Society Annual Meeting.

The first annual meeting of the Telegraphers' Aid Society was held at the United States Hotel, this city, on Sunday, March 13, and was largely attended. Seven ladies were present.

The reports of the officers show 110 members in good standing and \$419.71 in the treasury, of which \$400 is on deposit in the East River Savings Bank.

The following officers were elected to serve during the next year: President, T. P. Scully; Vice-President, Richmond Smith; Secretary, J. W. Moreland; Treasurer, F. W. Baldwin; Executive Committee, E. C. Cockey, J. B. Sabine, F. W. Cushing, A. T. Creelman, J. K. Calvert, W. B. Waycott, J. W. McLaren; Auditing Committee, Mr. A. S. Downer and Misses K. E. Cummings and F. A. Martin.

A clause was inserted in the constitution limiting the payment of benefits to sick members to six months, but allowing the Executive Committee to extend the limit at their discretion. The amount paid on the death of a member was placed at \$50.

The meeting was harmonious in every respect, and the Society enters on its second year under most favorable auspices.

#### American Exhibit at the Paris Exhibition.

A telegram from Washington states that the Department of State announces that a commission has been organized to represent the United States at the forthcoming electrical exhibition at Paris. The Assistant Secretary of State will for the present act as honorary commissioner general, and Mr. George Walker, the Consul General at Paris, has been requested to act as Executive Commissioner in that city. Mr. George E. Gouraud and Mr. Charles R. Goodwin have also been appointed honorary commissioners. Every effort will be made to secure a creditable exhibition of American progress in electrical appliances. Intending exhibitors should address applications for information, blank forms, etc., to the Assistant Secretary of State, Washington, D. C. No application for space should be sent in later than April 20 next. As Congress has made no appro-

priation for the representation of the United States at this exhibition, exhibitors will have to bear all their own expenses and ship goods to Paris at their own cost and risk.

#### Chicago Notes.

To the Editor of The Operator:

SIR: On March 10th General Eckert and son, and Supt. J. J. Dickey paid us a visit. Their mission here is unknown to your correspondent; probably they were on a tour of inspection, and directing the changes about to take place in the closing of the A. U. and A. & P. offices, and the enlargement of the old W. U. office, in order to take in the wires of the defunct.

On March 17th the "service slips" were abolished *Satis, superque* (enough and more than enough), will likely be the substance of many a hearty comment, particularly from managers who have been intensely annoyed in their efforts to reconcile the seeming inconsistencies "on the face of the returns" with the actual condition and needs of the service. It is to be hoped that the questions thus sought to be reached or proven have been satisfactorily confirmed or denied. Many have regarded the advent of the "service slips" as casting an unkind shadow of distrust upon managers and operators generally, causing some thoughtful ones to feel at least a secret revolt, the spirit of which could not at all enhance the effect of an honest, nor restrain the tendencies of a dishonest, purpose. There are, perhaps, better and not more costly ways to assure the purity of official transactions, and also to stimulate the best operators to mightiest efforts. Evidences of confidence and appreciation, liberal acknowledgements of the value of the services of the tried and worthy, and the careful creation and bestowal of honors where honors are due, would doubtless promote a healthier and more thrifty state of affairs for all concerned. The managers of the great mammoth consolidation may not find a more certain means of contributing to the perpetuity of their glory and power than may be brought forth by a wise consideration and study of the human incentives to earnest endeavors.

Transfers from the A. & P. to W. U.: The brothers Brady, Messrs. Wm. Long, Patterson and Morris; from A. U., Mr. Roberts; all to night force. It is reported that both the A. U. and A. & P. offices are to be finally closed on April 1.

Mr. C. S. Alberts is compelled to retire, on account of ill-health, to his home in Indianapolis. R. W. Ledwith, late report operator for the *Inter-Ocean* private line, has been transferred to Washington, D. C., to act in same capacity there. We all regret his leaving us, and our best wishes attend him. Mr. James Bradley, late night chief at Milwaukee, succeeds him here.

We are sorry to report the recent death of the wife of Mr. Maynard Huyck, and also the infant daughter of Mr. S. O. Bracken, Night Chief Operator W. U.

Although some operating and chiefly talent will be thrown out of employment by the general closing up of offices, most of the boys expect, in some way, to find seats with "the old reliable." At any rate, outsiders need not look this way for openings any time in the immediate future. It is not probably, however, that many of our operators of ability will be forced to idleness very long. The spring and summer business booms will, doubtless, create a demand quite as urgent as was that of last year. Many, too, may find an agreeable and profitable change with some of the new railroad companies, particularly in the vast Southwest, rapidly developing in commercial and mining importance, and where young operators might soon discover prospects ahead that would promise much more than a mere listless existence, if not wealth and honors unthought of now. A late report says that the Southern Pacific Railroad will require operators at the rate of thirty a month for some time to come. Let us trust that, after all the expected changes, may of us will have gravitated to positions of unusual prosperity and happiness. "There is a tide in the affairs of man," etc.

#### Closing Up the A. & P.

To the Editor of The Operator:

SIR: At last the A. & P. is dead, and will soon be resting in the family vault at "195," where so

many of its companions are sleeping, while the corner so long known among telegraphers as "145" is in future to be occupied by an insurance company. Among those who are fortunate enough to be transferred, with other valuable property, to the W. U. building are: W. B. Clum, one of the first to connect a telegraph wire into "145," almost 25 years ago. He does not change with the wind, as his long, gray beard will testify. Lant S. Jones, whose hair is growing silvery in the service, shares the same honor. R. Power, after many years with the opposition, together with E. A. Radigan, A. J. Voyer, J. B. Sabine, B. A. Squires, Miss O'Laughlin and Mrs. Fay, nee Miss Grant, with others, will probably be retained by the "big company." Those who have already received notices of "possibilities" may also share with their companions, although it cannot be definitely known.

Among those who have recently left us are: Miss Minnie Swan, gone to assist in "passing the ckt" with the American Rapid. Miss Mamie Smith joins her.

Mrs. Johnson goes to smile on the brokers. E. L. Marsh, following scripture, goes to do likewise. F. W. Lord has made himself "solid" somewhere, while Geo. S. Williams will go to Troy, N. Y., to watch from afar the gathering mists. T. A. Van Tassel has accepted a position with the Western Union in Newark, N. J., and G. H. Ackerman will talk to us from Paterson, N. J. S. S. Scandlan has joined his fortunes with those of the National Associated Press. There seems to be a sense of sorrow pervading all, at the prospect of an early separation, but it is only visible to one who is sharing in the same feeling, and many times in the future as the leaves of memory are turned will be recalled the pleasant seasons enjoyed at "145," where courtesy seemed to go hand in hand with loyalty, and where, from the president down, nothing but good will has been interchanged. We cheer ourselves with the thought that, although an edict may separate us, yet we are still united in one common band of brotherhood which no power under the bended heavens can scatter.

"30" on A. & P.

FESTUS.

145 Broadway, N. Y., March 28, 1881.

### Richmond (Ind.) Notes.

To the Editor of The Operator:

SIR: The A. & P. and A. U. offices having been closed, all Atlantic and Pacific and American Union wires have been run into the Western Union main office. Richmond can now boast of forty-eight main line wires and one city cable, and has fifteen sets of instruments in constant use. At present the force consists of Z. P. Hotchkiss as manager; C. C. Perry (formerly manager American Union), bookkeeper; E. E. Fulton, operator at main office; G. M. Samuels, operator depot branch office; James Carr, operator at Hoosier Drill Works. W. L. Hibbard, manager telephone, takes C. N. D.'s at Board of Trade. F. W. Samuels has left us to accept a more lucrative position at Indianapolis. Frank has been working here for the last seven or eight years; he is a first-class operator, and Richmond will miss a good man in him. At the P., C. & St. L. Railway office, J. W. Fiafrock is chief train dispatcher, with J. H. McAlpine, first; T. Reynolds, second, and Col. E. E. Quick, third assistants; John B. Trindle, Bent Boyer and C. C. Longsdorff, day operators; Frank Duel, night operator; W. S. Brewer, Jr., operator P. H. freight-house. At C., R. & C. Railway office, J. W. Lawson is day operator; and Will Glant is the "owl." As G., R. & I. Railway office, John Olds is on duty days, and F. R. Wires nights.

C. H. Hotchkiss (nephew to the W. U. Manager), has started a telegraph "college" in this city. It has been running about six weeks. He started in a flourishing style with five would-be learners, but his class now numbers only three. Mr. H. is advertising for a "few more students to learn operating." A few days since a young fellow (evidently from the country), who was contemplating sacrificing himself for the "Telegraph Institute's" pecuniary benefit, asked me what I thought about it. I told him my valuable advice to him would be to go to school a while longer before he attempted to learn telegraphy, whereupon he very innocently inquired: "Do you have to know anything about telegraphy to be an operator?" "N. M. in."

## TELEPHONE DEPARTMENT.

"Buzzing a telephone" is the latest slang phrase.

The telephone has developed an entirely new school of Hello-cution.

Paris proposes to establish a system of police telephonic stations, on the Chicago plan.

Dr. Cornelius Herz claims to be able to entirely discard the principle of magnetism in telephony.

If Adam could have had a telephone in the Garden of Eden, it would have been "Halloo! Eve" the most of the time.

Mr. James Elverson, the publisher of *Saturday Night and Golden Days*, and an old operator, is about to erect a new and magnificent building in Philadelphia.

Mr. E. T. Greenleaf, who had charge of the Metropolitan Telephone Co.'s wires in the uptown district, this city, has resigned, and is now with the Edison Electric Light Co.

The English Post-office Department has warned the Dublin corporation that the proposed erection of the telephone wires in that city will be illegal. At the same time the authorities intimate that they are prepared to do the work.

Mr. J. H. Emerick, Central Office Inspector, Metropolitan Telephone and Telegraph Co., this city, has resigned to accept a position with the Mutual Union Telegraph Co. Mr. J. H. Hingle, Manager Supply Dept., same company, has resigned, and goes with the Mutual District Messenger Company.

Mr. C. H. Walton, formerly manager of the Telephone Exchange, at 82 Nassau street, this city, and more recently of the Exchange, at 97 Spring street, has been transferred to Elizabeth, N. J., as manager of the telephone business and superintendent of the fire alarm telegraph. He and other gentlemen of Elizabeth are about organizing a local telephone company, to control valuable territory in New Jersey. The new company will make Elizabeth their headquarters.

The convention of the National Telephone Exchange Association will be held at the Grand Pacific Hotel, Chicago, commencing Tuesday, April 9. The committee has only been able to arrange for reduced rates of fare by one railroad line, that of the Erie & Chicago. Round trip tickets from New York, via the Erie Railway, can be procured through Mr. M. W. Doran, of the Metropolitan T. & T. Co., at \$25 each. Delegates can also have ordinary rooms at the Grand Pacific Hotel at \$3 per day. The convention will be important from the fact that all standing committees, of whom thirteen were appointed at the Niagara Falls convention, will report at this meeting.

A long series of experiments have been successfully conducted under the patronage of the French government on the telegraphic lines of the State; concluding trials were witnessed, among others, by M. Cochery, Minister of Postal Telegraphy; M. Jules Ferry, Prime Minister; M. Léon Say, President of the Senate; M. Becquerel, and other members of the Academy of Sciences, and other members, senators, deputies and a great number of engineers. One of the most extraordinary experiments was the transmission of speech on a single wire from Tours to Brest, on a wire passing through Paris, the length of which exceeded eight hundred miles. One single Leclanché element was the sole battery in use.

If growth be an indication of business prosperity, the Bell Telephone Exchange in Portland, Me., must be flourishing. Since the present company took charge of the exchange in April last, they have increased the list of subscribers from 170 to 400. The exchange has recently adopted the plan in use in large exchanges, of calling by numbers instead of name. The amount of business done is from 3,000 to 3,500 communications daily. Mr. I. H. Farnham, managing electrician, has charge of the operating room, with Mr. John E. Tierney assistant. The operators are Messrs. Waldron, Smith, Mahoney, Cooper, Folsom, Burnes and Mike Devine, night owl. The ladies' list is Misses Facey, Wiggins and Seevey. It is stated that Mr. Dan Smith has the greatest record in switching.

For a short time past there has been "a telephone difficulty," as the papers term it, down in Washington. The persons whose houses and

places are connected with the telephone exchange complain that the prices are too high even for good service, and that the service has been extremely bad. Gradually, many of these people have grown weary of answering wrong calls, or failing to get responses to their own calls, and of the vexation of spirit which the invention causes by its bitches, delays and jangling errors. On the 21st ult., three hundred of the six hundred subscribers held a meeting and resolved to withdraw their patronage on April 1, and until the company and the association's Executive Committee agree upon a schedule of rates. Another meeting will be held to consider the advisability of removing the wires of the company from all buildings controlled by members. The price of the use of the telephone and the Exchange was before the revolt \$46 a year. The members not only object to the proposed new rates, but also ask that the old rates be reduced. The company asserts that it cannot carry on business at the old rates without loss.

## DASHES HERE AND THERE.

Signal service stations are to be established at six points in Alaska.

It is reported that the Russian authorities used an electric battery to extract a full confession from the Czar's assassin.

Since telegraphic messages in Germany have been at the rate of one cent a word they have proved profitable. Before that they were a loss.

A cable dispatch from London says that the cable steamer Faraday, which will be engaged in laying the new Atlantic cable, is under orders to sail at the end of April.

Mr. William H. Vanderbilt, with fifty millions salted away in Government bonds, says he is quite content. Now you're shouting, William; so we would be under similar circumstances.

Dr. Sanford heard so well from his advertisement in our Feb. 15 issue, that he to-day repeats his offer to send a copy of his eighty-page treatise on the liver, prepaid by mail, on application.

The third annual reception and ball of the Erie telegraphers will be held at Paterson, N. J., on Wednesday evening, April 20. The former balls given by the Erie telegraphers have been great successes.

The Standard Silver Company, whose advertisement appears in the present number, is a reliable firm. From a personal examination we can say that the silverware they offer is remarkably good for the price.

The electric light will burn and tan and develop freckles like the summer sun. How popular, says the Philadelphia News, it will be with families who spend the summer season in the back rooms of their houses?

A great offer by a reliable firm—Earrings, Finger Rings, French Diamonds, Amethyst, Garnet, Topaz or Coral, set in Rolled Gold, Solid Settings, only One Dollar. Read advertisement G. W. Pettibone & Co. in this issue.

On the 26th ult. the court in Philadelphia granted a five-day injunction prohibiting the American Rapid from erecting poles on Chestnut street in that city, but this will not prevent them from opening in that city within a few days.

Owing to the unexpectedly large demand for copies of the first numbers of the present year, our reserve supply of the Jan. 15 and Feb. 1 issues has become exhausted, so that we are unable to furnish copies of these numbers to new subscribers.

The manager of the Granby, Que., office has invented an electrical clock, which, he claims, runs as perfectly as any spring clock. After once being regulated, it needs no further setting or other attention, and can be run on two cups of gravity battery.

The Eureka Trick and Novelty Company advertises exceedingly pretty decorated pearl shells in the present number. This company is not unknown to OPERATOR readers and anything they have advertised has always proved to be what they represented it.

An advertisement will be found in this issue of Messrs. E. & F. N. Spon, publishers and importers of scientific books, 446 Broome street, New York. This old-established house publishes or

can furnish the different books on electricity, telegraphy and other scientific subjects.

The *Hamburgh News* states that the Northern Telegraph Company has concluded a contract with the Chinese Government for the construction of a telegraph wire between Shanghai and Tientsin, a distance of about 1,000 English miles. Nine or ten telegraph stations will be opened at the most important points.

The London *Daily News*, in its financial article in its issue of March 16, says: "Anglo-American cable shares are depressed, in consequence of the circulation of the prospectus of a new Atlantic cable company to lay a cheap cable in competition with the existing companies, as well as with Jay Gould's proposed cables."

A remarkable case of death by lightning occurred, March 18, at Florence, S. C. James Best was crossing a field on his farm during a thunder storm and was instantly killed by a stroke of lightning, which tore up the ground whereon the man had stood to so great an extent as to bury him completely from sight at the bottom of a hole several feet deep.

We desire to call attention to the advertisement of Messrs. Moore & Wilson, which appeared in our issue of Feb. 15, in which they agree to mail their charming story paper, *The Cricket on the Hearth*, free for four months to every one who will send them 12 cents to cover postage. This is a rare chance to obtain a host of first-class reading matter for almost nothing.

The contract for the erection of a telegraph line in China provides also that a telegraph school for educating Chinese for the telegraph service in all its branches shall be opened shortly. At the opening of the school there will be thirty pupils, which number will be increased gradually. This will afford a chance for some of the "professors" in our telegraph "colleges" to emigrate to China.

Mr. A. B. Smith advertises the Barron Flexible Key Knob in the present issue. These key knobs had a very extensive sale among telegraphers when advertised before, a short time ago, and the universal indorsements they received were of the most unmistakable character. There is no reason why they should not have an equally large sale now. Every one troubled with telegraphers' paralysis should give them a trial.

The Perfected Type-writer, an advertisement of which will be found in this issue, is already well known to most of our readers. The type-writer is used by all the telegraph and telephone companies, but would doubtless come into more general use in connection with telegraphy if its advantages were better known. Messrs. E. Remington & Sons will send illustrated descriptive circulars free by mail on application.

A dispatch from Vera Cruz says that on Monday, March 28, the cable steamers *Dacia* and *International* began laying from that point the first section of the Central and South American Cable southward to Tehautepec. When they have completed this work they will return to England and take on the cable to be laid on the Pacific Coast from Callao, Peru, to Tehautepec Isthmus, via Panama, Costa Rica, Nicaragua and Guatemala.

A dispatch from Paris, on the 23d ult., says: The Minister of Marine has received a dispatch from the Governor of Senegal, reporting an engagement between 1,500 natives and 150 French infantry, who had been detailed to establish a telegraph line to Fouta-Jallon. After sharp fighting the natives were repulsed, and fled with a loss of 100 killed and wounded. The French lost four officers and nine men killed and nine wounded.

A complete unit of the Royal Engineers' Telegraph Train, says the *Electrician* of the 5th ult., embarked in the steam transport *France*, which sailed the other day for Natal. Two cable wagons were sent out with them, each carrying six reels of telegraph wire under the body of the carriage. As each reel contains half a mile of cable, a single wagon could provide a telegraph three miles long. In addition to this, however, a reserve of wire was taken sufficient for fifty miles of line. In operations in the field it is stated that these troops can take up and lay down a wire as fast as an army advances or retires.

Mr. H. W. Spang, of Reading, Penn., who will be remembered as the efficient superinten-

dent of the P. R. & P. Telegraph lines, has invented a remarkably ingenious automatic railway signal. By his new system a danger signal is always displayed until a locomotive or train approaching the section of track to be protected reaches the circuit closer or breaker, when the electro-magnet will be charged and the danger signal thereby removed from the view of the engineer and a safety signal given to him, provided the rails of the section of track to be protected are not occupied by a locomotive, train or car, a switch is not set for a siding or branch track, a rail is not removed or broken, and cars on a siding do not project too near the main track. Should the rails of the section of the track ahead be occupied by a locomotive, train, car, or pair of wheels, or even by a heavy iron bar, a rail removed or broken, a switch set for a siding, or a car, or cars on siding project too near the main track, the danger signal will remain stationary, thereby indicating to the engineer that something is wrong, and that he shall proceed with caution. Should a safety signal be displayed before the locomotive reaches the circuit closer and breaker, it will indicate that the signal mechanism has stuck, or is not working properly, thereby notifying the engineer to proceed cautiously.

## NEW YORK CITY ITEMS.

### Echoes from 195.

Dr. Osborne has returned from a three months' absence in Southern California.

A Jersey operator is credited with "dig and live" for "digestive," in a message from a Hoboken M. D.

It is the unanimous opinion of the Division Chiefs that all Mr. Lou Weller wants to make him perfect is a few brilliant flashes of silence.

The wife of Mr. John J. Kiernan, President of the Wall Street European and Commercial Telegraphic Agency, died at her residence in Brooklyn, March 26.

Mr. W. F. Bonnell, from the Cincinnati W. U. office, is finding much-needed relief from medical treatment in this city. He fills in several hours per day in the main office.

Mr. Thomas H. O'Reilly, of the Associated Press wire, recently sent 2,437 words in one hour. This is at the rate of 80 messages per hour, allowing 30 words to a message.

All the press circuits have been connected with the Associated Press rooms, up stairs. The agents are thus saved much annoyance, and the operators enjoy what is termed a "soft snap."

The management has concluded to dispense with the services of Mr. Brandell, the "fly" sender. In a parting epistle to a friend, he signified his intention of a hasty departure to Mexico.

As an indication of the way business piles in, Miss Mamie Crough, an office messenger in the main office, one day last week distributed on the Western circuits alone 485 messages in 40 minutes.

W. U. business has increased wonderfully of late, and the A. U. are called upon to transfer all of their spare men to help out, while several have already been permanently transferred from the A. U. to 195.

The city line switch board is presided over by Mr. Fred Cushing. There being a scarcity of first-class lady operators, Mrs. Breck, formerly assistant to the lady manager, has taken a position at a table where good service is required.

A Lockport, N. Y., paper says that Manager M. W. Griffin, of the Western Union office in that city, received the Associated Press reports on March 22, at the rate of 58 words per minute, the sender being Operator Minier in the New York office.

Mr. Lambdin has returned from an extended vacation, or, as he terms it, "from having a three months' conversation with one in whose soul's salvation I am interested." The photographs which he circulated among the ladies were very much admired.

We have worthy men filling the positions of chief at large, wire chief at large and traffic chief at large, and unless some unworthy operators pay more attention to business there will be many filling the less lucrative positions of "operators at large"—outside of the office.

The Board of Aldermen last week authorized the Edison Electric Illuminating Company "to lay tubes, wires, conductors and insulators, and to erect lamp posts in the streets, avenues, parks and public places in this city, for the purpose of conveying, using and supplying electricity or electrical currents for purposes of illumination."

George Cunningham, formerly a clerk in the operating department, but recently employed as operator in the broker's office of Fiske & Hatch, died in this city last week from small pox. A younger brother also died from the same disease a few days later. They were brothers of Harry Cunningham, operator at 195.

The New York Electrical Society meets in the Geographical Lecture Room of the Cooper Union, at 8 P. M., Thursday, April 7. The first lecture will be on "Electrical Measurements with the Wheatstone Bridge," and will be delivered by Mr. George B. Scott, Superintendent of the Gold and Stock Telegraph Company.

The following from a 195 correspondent will, we are sure, be indorsed by all the operators in the W. U. main office: "Whatever else may happen in the way of changes, it is to be hoped that Manager Downer will be left with us. He always strains a point or two in favor of an indigent telegrapher, and in the realms of humanity he is a king among kings."

New York is the objective point of many Western operators recently thrown out of employment, several arriving daily. While there has been a demand for first-class talent at 195, it is being supplied from the N. Y. A. U. and A. & P. offices, so that operators looking for positions would do well to try and provide for themselves away from New York, rather than enter an overcrowded field.

The W. U. athletic games will take place on Thursday, May 19, if the grounds can be had for that day. The arrangements for the games are progressing very favorably, over fifty entries having already been received, and, judging by the subscription list, the medals will be valuable. Several Canadian telegraphic athletes are expected to be on hand to take part, and the committee hopes that other cities will send representatives, as the various games are open to all telegraphers. The entries close on the first of May. Programme of the games and further particulars may be had by applying to the Secretary of Athletic Committee, 195 Broadway.

The abolition of the "operators' service slip" is a blessing for all the good men in the W. U. service who have suffered by having their work, done on light circuits, contrasted with that of poor and unreliable men who happened to be assigned to heavy ones. Gen. Eckert looked into the matter personally, and as soon as it was shown to him that the system was doing an injustice to many of his best operators, he ordered its abolishment. The operators interested unite in thanking the General for this action. Gen. Eckert is doing all he can for those who will be thrown out of employment by the closing of A. U. and A. & P. offices. He is making room in the W. U. for men from the other companies for whom there does not seem to be any place.

### Other City Items.

The routing clerk at 145 won a five-mile race, March 16th, but lost a week in recovering from the strain. The stakes were only a dollar.

Owing to an increase of nearly 65 per cent. in the gas bills of the White Star steamship line (which is attributed to the bad quality of gas), General Agent R. J. Cortis has adopted the United States electric light system for use on Pier No. 52, North River. In addition to using this light on the pier, it is proposed to use it in the holds of the White Star steamers while loading and discharging, thus avoiding the risks and inconvenience of gas or kerosene. Mr. Cortis believes that the saving will be at least \$100 a month, or 33 per cent.

The Mutual District Messenger Co. (Limited), are fitting up executive officers at 29 Murray and 33 Park Place, and will remove from present temporary location early in April. This company last week applied to the Common Council for the right to lay its wires underground throughout the city. If this application is granted, immediate steps will be taken to place their wires underground. A new district office has been fitted up and opened at 950 Broadway. This

office is a new departure in its way, being provided with a ladies' parlor in the rear part of the office.

## PERSONALS.

Mr. F. L. Ames has been elected a director of the Western Union.

Mr. T. A. Edison has just obtained his three hundred and first patent.

J. C. Hinchman, general superintendent of the Western Union in this city, has resigned.

Mr. William B. Gill, assistant superintendent of the Western Union at Philadelphia, has resigned.

Captain Mackintosh, for a quarter of a century foreman of construction in this city, has resigned.

Mr. Charles E. Valentine, a well-known old-time operator, was buried at Oakland, Cal., on Thursday, March 17.

Miss L. Smith, formerly of Austin, Tex., is now manager, and Charles A. Flinn night owl, of the W. U. office at Jacksonville, Tex.

Mr. J. N. Taylor, Chief Clerk in Assistant General Superintendent's office, Met. T. & T. Co., has resigned, to go into mercantile business.

Mr. Warren E. Tice (Ic.), formerly of the W. U., this city, left March 26 to take a position with the American Rapid in Philadelphia, where his parents reside.

Mr. Jay Gould is reported to have given \$25,000 to the fund for General Grant. Mr. W. H. Vanderbilt did likewise. Mr. John Lenhart has not yet subscribed.

Maj. E. O. Brown, at present one of the most successful and popular insurance men in Toledo, O., was formerly manager of the Western Union office at LaFayette, Ind.

Mr. Frank J. Boudreau has resigned his position with U. P. Railway at Rock Springs, Wyo., and accepted a position as operator for the Southern Pacific in Arizona.

Charles F. Wood, Assistant General Superintendent of the Western Union Telegraph Company for New England, has resigned on account of ill-health, and will go abroad.

The Springfield, Mass., *Union* says that up to 4 o'clock P. M. on Monday, March 14, Mr. Geo. G. Ware, of the W. U. Office in that city, received 9,000 words of press report, and up to 6 P. M. 11,700 words.

Mr. Elmer P. Crooker, of Searsport, Maine, has been appointed ticket agent and operator for the Eastern R.R., at Wenham, Mass. He is a boy making a fair start, and goes to Wenham highly recommended.

Any information of the whereabouts of C. S. Kirtland, who, in December, 1879, worked for the Western Union at Bowling Green, Ky., will be thankfully received. Address W. M. Carpenter, Jr., Grand Rapids, Mich.

Mr. John A. Anderson is W. U. manager at Marion, Ind.; Wm. Ash and Mr. McDonough are with the P., C. & St. L. Ry., and jolly Mr. Buzard and Mr. Hamaker with the C., W. & M. Ry. Mr. A. J. Grief is agent and operator for the T., D. & B. Ry.

At the inquest on the body of Conductor Carney, who was killed recently by an accident on the Pan Handle road, the jury, on the 14th ult., returned a verdict fixing the blame on H. A. Foster, the operator. As the verdict said nothing about criminal carelessness, Foster was not arrested.

The Pittsburgh & Lake Erie R. R. is 69 miles long, extending from Pittsburgh to Youngstown, O., and does a first-class business. It has 18 telegraph offices and about 30 operators, all good men. The Superintendent, Mr. Jones, always has a kind word for the boys when he meets them.

If any operator knows the address of John D. Cameron, an operator who worked in Board of Trade, A. & P., Chicago, Milwaukee and St. Louis, a year or two ago, he will confer a favor by communicating with him and his brother, J. A. Cameron, Napanee, Ont., who is dangerously ill and anxious to hear from him.

The C., M. & St. Paul Ry. telegraph line has been kept unusually busy of late, by reason of the snow blockades, and the fact that with the exception of one mail a week

all communication with the towns along its route had to be carried on by telegraph. Mr. H. R. Williams is train master of the road and Mr. E. H. Graves train dispatcher.

Mr. S. A. Muncy, who died at Summerside, P. E. I., March 9th, was an old-time operator. He was a native of Halifax, N. S., but had been in Summerside nearly twenty years. Up to within two years ago, when he resigned to accept the position of agent and operator for the P. E. I. Railway Company, he had been an operator in the Anglo-American Telegraph office.

Mr. W. H. Rinehart, of the Western Union office at Leadville, was married Feb. 23, at Denver, to Miss Kittie Clark. The joyous occasion created a sensation in Denver, and after the ceremony congratulatory telegrams came flowing in from all quarters. The presents were numerous and costly. Mr. Rinehart is deservedly popular in our profession, and we wish him and his bride much happiness.

The *Washington Star*, in speaking about the White House says: "The telegraphic operator is Benjamin F. Montgomery. He is the youngest man in the office, with one exception, and the wittiest. He possesses the adornment of light brown hair and a new growth of auburn beard. He can send and receive as fast as anybody that 'pounds brass.' He has a new set of nickel-plated telegraph instruments, and is as proud of them as of his baby."

Mr. Wm. Gramlich is manager at Carlstadt, N. J.; Mr. J. E. Church, chief operator at Hackensack; Miss Fannie Bogert, manager at Upper Hackensack; Mr. J. F. Bonton at Cherry Valley; Mr. Harrison at River Edge; Mr. Ike Onderdonk at Westwood; Mr. E. B. Shurter (formerly of Kingston, N. Y.) at Hillsdale; Mr. Lew Bogert at Pearl River; Mr. P. Wilber at Nanuet; Mr. Will Thorne at Haverstraw, and Mr. Garry Haring at Stony Point.

On Saturday, March 26, Mr. J. J. S. Wilson, who since 1856 has been superintendent of the Western Union Company at Chicago, telegraphed his resignation of that position to General Eckert, to take effect March 31. On the same day Mr. Wilson's son, Charles Wilson, who for some time has been the electrician in the Chicago office, received notice from New York that his services would no longer be required. These are the first important changes in Chicago following the consolidation.

Mr. W. R. Plum, who has for some time been engaged in writing a history of the U. S. Military Telegraph, has gone to Lamy, New Mexico, to recruit his health, which was badly shattered by reason of overwork. He expects to remain in New Mexico until May, when he hopes to return to Chicago and devote all his attention to the work of finishing the writing of the book. The volume will contain from 500 to 600 pages, and promises to be a very interesting and valuable contribution to telegraphic literature.

READING, Pa.—Mr. Ambrose S. Miller, extra operator, P. R. & P. T. Co., was married, January 6, to Miss Maggie Craig. Their bridal presents were profuse and handsome. On Sunday, January 23, Mr. E. R. Adams, Superintendent's office, same company, was presented with a charming daughter, and on Sunday, February 20, Mr. F. N. Boyer, manager Reading depot office, also with a daughter. Died, March 15, Eugene Hoyt Boyer, aged 2½ years, only son of Mr. J. Harry Boyer, operator at general dispatcher's office.

Mr. Julius Wooten, a well-known operator in the Western Union Telegraph office in this city, left yesterday morning for Tampico, Mexico, where he will take charge of an office to be opened there on his arrival. Mr. Wooten came to Chattanooga from Florida during the scourge of 1878, and since that time, by his dignified bearing, genteel and polished manners, won hosts of friends, and gained great popularity in society. The best wishes of his large circle of friends follow him to his new home.—*Chattanooga (Tenn.) Times*.

Old man Kav put in an appearance at Tenth and Chestnut streets, Philadelphia, one day last week. A correspondent of THE OPERATOR, who passed him on lower floor, says he had a look of utter "brokenupness," and was in a completely demoralized condition. During the day Harry Schotte received the following "old timer"

note from the old man: "Fren Hary—I've jist cum in frum Chicargoo, wher I've ben wurkin' the soap racitt. Cum down stars and bring A quarther An wee wil hav A foine tig. Til Deth. "OLD MAN KAV."

LEADVILLE, COL.—The Western Union office at this place is in charge of Mr. J. A. Hagerlund, manager, with Mr. W. H. Rinehart as assistant manager. The latter, who was married in Denver on the 23d inst., is the pioneer operator of Leadville, having opened the office here when the first line was run into "the camp." Mr. E. B. Beecher, a well-known operator and electrician, is chief operator. Mr. E. T. Ball is day operator, and Messrs. C. A. Batson and W. D. W. Storm are night operators. Mr. Weisse has charge of the branch office at the depot.

The A. & P. and A. U. offices in Bridgeport, Conn., were closed March 18th, the wires and instruments being transferred to the office of the W. U. Co. This large increase of wires crowds the Western Union office very much, it having now 55 wires, with little room to accommodate such a number. It is now no secret that the American Rapid Co. will open an office in Bridgeport April 1, and will occupy the former office of the American Union. Many predict for the "Rapid" a large business, in view of the fact that the office is to be managed by Mr. J. S. Krum, assisted by the former American Union corps.

PORTLAND, ME.—The A. U. and A. & P. have both put up their shutters. Manager Neff, of the A. & P., has left town, and Warren Mitchner, day operator, has left for parts unknown. Manager Preble, of the A. U., is still here, fixing A. U. business. Night operator W. H. Bailey has gone firing on the M. C. R. R.; Charles Stevens, day operator, to Boston. Repairman Johnson, of the A. & P., has started a telegraph school, though in view of the consolidation there would not seem to be a very brilliant prospect for a "school"-taught operator to find employment. Telegraph business here is remarkably good for this season of the year. Mr. M. E. Hayes, day operator W. U. office, has been confined to his house with pneumonia since January, and is now sinking rapidly. M. S.

## BORN.

DODD.—March 25, to C. H. Dodd, Agent and Operator I. C. R. R., Mona, Ia., a daughter.

## MARRIED.

RINEHART—CLARK.—At Denver, Col., Feb. 23, 1881, by Rev. Dr. Moore, W. H. Rinehart, of the Western Union Leadville Office, to Miss Kittie Clark, of Denver.

## DIED.

MUNCY.—March 9th, 1881, at Summerside, P. E. I., Mr. S. A. Muncy, agent and operator, aged 42 years.

**BOOKS.** DESCRIPTIVE CATALOGUE OF SCIENTIFIC Books and Price of any Book on Electricity sent promptly on application.

PATERSON, E. *Electric Signals*. Giving a description of electric bells and their construction, the arrangement of batteries, wires, press buttons, indicators, bells, telegraph instruments, telephone lines, lightning conductors, etc. Fully illustrated. Price, 20 cents.

BEECHER, F. S. *Electro-Telegraphy*. A book for beginners. 8vo., cloth. 60 cents.

BELL, ALEX. G. *Researches in Electric Telephony*. Many illustrations. 8vo., paper. 60 cents.

SPRAGUE, JOHN T. *Electricity; its Theory, Sources, and Applications*. Illustrated. \$3.

HIGGS, DR. PAGET. *The Practical Application of the Electric Light*. Illustrations of lamps and dynamo machines. 8vo. \$3.50.

HIGGS, DR. PAGET. *Electric Transmission of Power; its Present Position and Advantages*. Illustrations. \$1.20.

GORDON, J. E. H. *Electricity and Magnetism*. In two vols., containing 618 pages, and illustrated by 52 plates and 255 engravings. 8vo., cloth. \$7.

**E. & F. N. SPON,**  
446 BROOME ST., NEW YORK.

## DECORATED PEARL SHELLS.

These beautiful imported Pearl Shells are found on the coast of Japan, washed up from the waters of the Pacific Ocean. The inner surface of each shell is decorated with a handsome oil painting, painted by hand in the most artistic manner, and representing Oriental flowers, vines, shrubbery, etc. The ornamentation alone, if done in this country, would cost much more than we ask for the shells. They range in size from 11 to 13 inches in circumference. When held to the light their polished surfaces will reflect all the colors of the rainbow, besides, being highly ornamental, they will be found very useful as card receivers or as receptacles for the thousand and one little nick-nacks which accumulate upon the centre-table or mantel-piece. We have purchased an entire consignment of these rare Arabian shells, at less than one-half their real value, and now offer them at the following unheard of prices: one shell, 15 cents—two for 25 cents—one dozen different sizes and designs, \$1.25. Each shell is packed in a strong box and sent by mail, post-paid. Clean postage stamps of any denomination accepted the same as cash. Address all orders to

**EUREKA TRICK AND NOVELTY CO.,**

**39 Ann Street, New York.**

Box 4614.

### A GREAT OFFER BY A RELIABLE FIRM!

In order to introduce our goods in every neighborhood in the United States we will forward, all shipping charges prepaid, **ANY FINGER RING OR PAIR OF EAR-RINGS**, as shown in illustrations, provided you cut out this advertisement and send to us with **ONE DOLLAR** on or before **June 30th, 1881**. If you wish we will engrave any name, initial, motto or crest on the inside of rings without extra charge. At the same time we send the article ordered we will mail you a bundle of our catalogues and feel sure that you will be so highly satisfied that you will show your appreciation by distributing our catalogues among your friends and at the same time exhibit goods received from us. You can in this way assist us in selling other goods of standard quality which are manufactured from new and original designs, and which we guarantee to give satisfaction, and if not as represented money will be refunded. Numbers 30 and 37 we furnish in either anythist, garnet or topaz (according to preference which you wish). No. 32 is a band ring, handsomely chased. No. 29 is set with our celebrated French diamond, being finely cut from the whitest stone and very brilliant; in fact we do not hesitate in saying they are the best imitation of the real diamond ever produced, and only experts can detect that they are not. No. 30 has the same setting (French diamond) as the No. 29 ring. No. 38, a beautiful pair of ear-rings, real coral, mounted on diamond chased anchors. **ALL THESE GOODS ARE MADE FROM FOLDED GOLD, AND EACH IS SOLID.** We wish to caution the public against many firms who are advertising cheap and worthless jewelry. Our goods are first-class in every particular, and our object in offering a few styles of our standard goods at the above nominal price is to secure permanent customers for other goods. We can only send out a limited number of these goods at price named, and in order to protect ourselves from jewelers and others ordering in quantities, we will insert this advertisement but only two in this paper hence require you to cut it out and send to us when you order that you may know that you are entitled to the benefit of this offer. Remember, we will not send more than one ring or pair of ear-rings at price named but you can make a selection of either. If more than one article is desired we will supply them at prices given in our Illustrated Catalogue, which we will mail you. Some persons persist in sending more than one dollar, ordering and expecting to receive more than one of the six articles advertised; to all such we must say, you can save us much trouble by sending not more than one dollar and ordering one finger ring or pair of ear-rings, and thus save us the trouble of returning your money when you do not comply with this advertisement. **WE SELL YOU ONE ARTICLE AT THIS REDUCED PRICE MERELY TO INTRODUCE OUR GOODS.** To ascertain the size ring you wear, take a piece of paper and cut it so it will most just around the finger you wish to wear the ring on, sending the slip to us. In ordering, give number of article wanted, and if a finger ring, state what you wish engraved. Money can be sent by Registered Letter, Post Office Money Order, or through the regular mail. We refer to any Bank, Express Company, or reputable firm doing business in this city. Address **G. W. PETTIBONE & CO., 25 Maiden Lane, New York.**

GOODS SHIPPED ON DAY ORDER IS RECEIVED!

## Fine Table Silverware almost Given Away!

ONLY  
**\$6.00**  
FOR THE  
ENTIRE SET.

**\$1.50**  
FOR  
ANY ONE  
PIECE.

After years of experimenting, and by a large outlay of capital, we have at last succeeded in the production of Silver-Plated Ware of the most sterling quality, and of the rarest and most elegant designs, at a reduction of fully two-thirds the former cost, and are enabled to place before the public first-class Silver-Plated Ware at prices below the cost of very ordinary china. Silver-Plated Ware has always been considered a luxury which many could not afford, but at the prices at which we are now offering it, it is much cheaper than anything else, as it will last a lifetime. There is hardly anything a lady takes more pride in than her table; and what will add more to the beauty of it than a handsome service of silver? and there is now no excuse for any one to be without it. In order to introduce our ware to the public, for a short time, to sell at our lowest wholesale prices direct to the consumer, thereby saving our patrons the large profits made by the jobber and retailer. Formerly any one of these articles would cost you more than we ask for the entire set, and it is only by manufacturing in immense quantities, and by our new process, that we can afford to sell at the following prices: Upon receipt of **only Six Dollars**, we will send by express, to any address, the five pieces represented in the above illustrations, viz.: No. 1. **SUGAR BOWL**—Exquisite in design and workmanship. No. 2. **CAKE BASKET**—Elegant (new model). No. 3. **DINNER CASTER** (5 bottles), very handsome. No. 4. **BUTTER DISH**—Very recherche design, with patent tray. No. 5. **TEA OR COFFEE POT**—Fire-proof. This ware is all White Metal, pure Coin Silver Plate, new in design and chasing, and warranted. The Tea or Coffee Pot is pure White Metal, silver-plated. It is of full family size, and is made with a patent copper bottom, rendering it perfectly fire-proof. The Butter Dish has the latest patent tray, it is easily kept clean, and will not corrode like the old-fashioned metal trays. The above cuts represent the ware as accurately as possible, but do not do it justice. Remember, we send the entire list of five pieces by express, securely boxed, packed, and guaranteed to reach their destination in perfect condition, upon receipt of **only Six Dollars**; or we will send them C. O. D., provided One Dollar accompanies the order, the same to be deducted from the bill. Or we will send your choice of any one of the five pieces, securely boxed and packed, by express, upon receipt of \$1.50, and you may have the privilege of sending the balance, \$4.50, for the remaining four pieces in the set, after you have received the first. This is a rare opportunity to secure a magnificent set of Silverware. We have established a Salesroom in New York City, at 23 Dey Street, where our goods will be found on exhibition, and if you are in the city we would like to have you call and see them for yourself, or if you have a friend or acquaintance in New York, please ask them to call on us and examine the ware for you. The articles are all full size, as will be seen by the dimensions given above. Do not be deceived by inferior plated ware, as each piece manufactured by us has the **Standard Silver Company** stamped plainly upon it. Any person buying this ware, and not being perfectly satisfied, can return it, and his or her money will be refunded. Remittances made by Post Office Order, Draft on New York (payable to Standard Silver Company), or Registered Letter, at our risk. In ordering, please give your Name, Post Office, County, State, and your nearest Express Office. In writing, mention this paper. Address **P. O. Box 1,882.**

**STANDARD SILVER COMPANY, 23 Dey Street, New York.**

## THE FOLLOWING TABLE OF CONTENTS

will give some idea of the style and scope of our new book,

## TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY,

which is now attracting so much attention

PRE-ELECTRIC TELEGRAPHS.....	7
Signaling among the ancients—Telephonic system of the African negroes—Signaling by sound in Montenegro—Fire communication in war and otherwise—Dr. Hooke's telegraph—The semaphore—Semaphoric blunder and its result—The word "Telegraph"—Prediction quoted by Addison.	
THE ELECTRIC TELEGRAPH—ITS BEGINNING AND DEVELOPMENT.....	14
First lightning-rod man—Frictional electricity discovered—The Leyden jar—Experiments to Franklin's time—His famous kite experiment—Robert Stephenson's boyish imitation—Lomond's electric signals—Lesage's invention of electric telegraph, using twenty-four wires—Reiser's thirty-six wire telegraph—Succeeding experiments to Morse and subsequently to present time.	
INTRODUCTION OF THE ELECTRIC TELEGRAPH IN THE U. S. ....	29
First American line—Apathy of scientists, press and public—Why the Herald refused to encourage the telegraph—Cornell and Morse—First apparatus—Interesting relic—First week of telegraph—Slender returns—Humors of early-day telegraphy—Countryman, turkeys and telegraph—Mr. Stearns and obstreperous church bell—Honor to whom honor is due—Ronalds—Morse—Henry—Vail—Claim for laborers—"Be jabbers, who dug the post holes?"	
A CHAPTER ABOUT OPERATORS AND MESSENGERS.....	50
The operators' view of human nature—Their faithfulness—Their literature—Their difficulties and trials—Epileptic telegrapher—Armless operator—Deaf operator receiving by sound—The "lightning striker's" blunder and a case of jealousy—Recognizing by touch—Love over the wire—Love disappointment in humorous verse—First marriage by telegraph—Absconding operator caught by novice—Wonderful speed in telegraphing—Messenger service—District telegraph boys and the various duties they perform—Anecdotes of them—Uniformed messenger mistaken for policeman.	
THE TELEGRAPH IN WAR.....	70
Earliest military signaling—Introduction of field telegraphy—Field telegraphy described—Dangers to apparatus—Firing guns by electricity—Telegraph in civil war—Its great value—What General Sherman said of it—Origin of U. S. Military Telegraph—Cost of service during war—Duties of cipher operators—Official acknowledgment of their services—Anecdotes of military operators' ready wit, heroic courage and nervousness—Funny war story—Another—Military operators' poor quarters—A provident telegrapher—Richmond taken—Receipt of the great news—Lincoln's assassination—Grand feat of Prussian soldier, and heroism of French female operator.	
CABLE TELEGRAPHS.....	95
General—The Atlantic cable—First suggestion of it—Its origin—Organization of company—Laying cable—The Great Eastern—Discontinuities—First message—Suggestor wittily silenced by Mr. Field—Cost of first Atlantic cable—Recent improvements in cable laying—Mr. Field's services—Cable operators—Cable codes—A specimen—Its interpretation.	
HUMORS OF THE TELEGRAPH.....	107
Economical Irishman—Timid old lady—Apprehensive Texan—Witty, incongruous and rhyming telegrams—A "killing" blunder—The "additional wurred"—A furious message—Satchel by telegraph—Snubbing a king—A proper old lady—Little "Johnny Russell"—Peter to Margaret Flagarty—He couldn't be fooled—"She writes like a man"—Model (?) Maine man—Hollow and "hello"—Fooling savages—"Onnateral fixins"—Chicago and—Witty illustration—Electrifying loafers—Shocking the negroes—Blind-folding the "masheen"—A crammer.	
TELEGRAPHIC "BULLS".....	123
A fatal "bull"—Matrimony killed by a "bull"—Instances of operators' "bulls"—A lord's mistake—John Brown and Seaton Bros.—Ale or oil—Too much coffee—Blessings in disguise—A profitable mistake—A military "bull" that was not all a "bull"—Senders' "bulls"—Habit and halibut—"Bulls" from bad spelling—A fishy story—Tragic "bull"—Injustice to operators.	
LIGHTNING FREAKS AND TRAGEDIES.....	138
Deaths from lightning—Effects in different countries—A triple tragedy—Curious freaks of lightning—Some wonderful instances—Lightning in telegraph offices—Operators killed.	
SHARP PRACTICE BY TELEGRAPH.....	143
Abuse of General McClellan's name—A modern "St. John"—Big swindle in Toledo—"Spiritualistic" swindling—Rappers' tricks—Their magnets—How to make them—Sir Charles Wheatstone's experiments—Two good stories of sharp practice by operators—Tampering with cipher message—The biters bit—Great bank swindle—Barb's telegraphic trap for burglars.	
THE TELEGRAPH AN UNIVERSAL INSTITUTION.....	160
A well-traveled message—Spanish peasants and telegraph—Telegraph in Morocco—China—India—The East in general—Japan—in Africa.	
THE WEATHER REPORTS.....	168
Death of General Meyer—His account of storm signal system—Its value to commerce and agriculture—The New York station—Cipher reports of weather—Difficulties of signal service—Early opposition—Origin of weather reports in the United States—Smithsonian Institution—Professor Henry.	
THE RAILROAD TELEGRAPHIC SYSTEM.....	179
Originated in England—First instance of train dispatching in this country—System at Grand Central depot—Moving trains by telegraphic orders—Official instructions—Train dispatchers and operators—Their responsibility—Thrilling incident—Operator who "forgot"—Noble operator—Latest inventions in railroad signaling—The train telegraph—No more screaming engines—Supplying locomotives with water by electricity—Fun on the railroad—Waking the Pullman porter—Operators' anti-suporific.	
ELECTRICITY AND LIFE.....	202
General remarks—Electric girl of La Perriere—Electrical lady of Nevada City—Electricity on dinner table—Feeling pulse by telegraph—Development of growth by electricity—Uses in surgery and dentistry—Electricity as a healer—An "anti-fat" story.	
OUTGROWTHS OF THE TELEGRAPH.....	218
The electric light—Edison's description—The light at Niagara—Experiments in San Francisco—Proposed illumination of Holyoke—Use in stores, steamships, and in war—The telephone—How constructed—The German name for it—Its invention—Telephone service meter—Transmitting sermons by telephone—First instance—Mr. Beecher's—The telephone in Jersey City law courts—Communicating between ships—Use in wooing—In military operations—Music—Humors of the telephone—The singing telephone—Yarn from Pine Bluff—Joke on reporters—One for Dawdles—Marriage by telephone—Telegraphing by light—The photophone—Electrical egg hatching and seed germination—Theatrical thunder—Toothache cured by electricity—Gas lighting and bell ringing by same means—Electricity as an umbrella—In taming horses—In connection with Moody and Sankey's meetings—Telegraphing by electrical air currents—Maps by telegraph—Magnetic magic writing—Electric driving power—Electricity in managing refractory horses—Engraving by electricity—Diagrams of targets over the wire—Electric combs and brushes—New uses for the sun's rays—The ocean a source of electricity—Suggested use of electricity in executing criminals—Slaughtering cattle and killing whales by electricity—Electric clocks that require no winding—Telegraphing by steam at sea—Electricity in steam—The Edison electric locomotive—Description of it—Electricity aiding weary cash girls—Conclusion.	

Copies promptly mailed, prepaid, on receipt of price, \$1.

## A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

**GOLD** For Every Determined Man or Woman. **YOUNG'S GREAT BOOK OF 400 SECRETS, OR HOW TO MAKE \$10 A DAY WITHOUT CAPITAL. GOLDEN WORDS TO THE WORKING CLASS.** How to get rich, or how to make money, is a thought that occupies the attention of the human mind as much, if not more, than any other subject. In our Book of SECRETS we never lose sight of the idea that we are addressing persons without capital, that very large class of our people that are battling and struggling hard through life without apparently making the slightest headway. We point out clearly how any person may make a start in business for themselves and not be dependant any longer on a paltry weekly or monthly pittance. We have started a large number of persons in business that do not leave their homes at all, and clear from \$25 to \$50 per week, by following strictly the directions laid down in the Book of SECRETS. Reader you can make money just as fast as those we have spoken of. **WILL YOU MAKE THE EFFORT?** It has already paved the way for many a young man toward making his fortune, and he does not require money to start with for the Book tells him how to commence business without money, and he goes on step by step, and soon accumulates a thousand dollars or more before he has really an idea of it. Our Great Book of SECRETS should be in the hands of every person who desires to better their condition in life—every lady that wants employment, every man, boy or girl that can spare an hour or two each day on the start. Much of the information cost us large amounts to possess with the Right to Publish the same to the world. One secret alone cost us, with the privilege to use it, \$250. You can be the possessor of ALL for FIFTY CENTS. If you have an occupation that takes up your time during the day, you can devote your evenings to many branches of the business. We have given in this Book over 400 methods to make money fast. Out of all the chances that are offered, select the one in which, according to your own judgment you can do the best, and you will come out victorious in the end. Three years ago, in the City of Philadelphia, lived a man and wife, in a garret bedroom without work, influence or friends. Fortunately for him, he was told of this Book of Secrets. He sent for it, and from his own lips, in the author's place of business, he said that he made over Twelve Thousand Dollars clear from what he has been taught by this Book. **Please bear in mind that we send Young's Great Book of Secrets, also the Paul Brothers Violet Ink Secret, also the secret and full instructions and Agents right to manufacture the Turkish Perfume, also the Secret of Manufacturing the CHENG WENG STARCH POLISH All For Fifty Cents.** Three Book of Secrets for One Dollar, get two of your friends to send with you and you will have your own book free.

**PERFECT ETIQUETTE, OR HOW TO BEHAVE IN SOCIETY.** A complete Manual for Ladies and Gentlemen, embracing Hints on Introduction, Salutation, Conversation, Friendly Visits, Social Parties, on the Street, in Public Places, in Traveling, Driving and Riding, Letter Writing, at the Table, Making and Recovering Presents, Courtship, Wedding Etiquette, Christening, Funerals, etc., with Suggestions how to Dress Tastefully. Toilette, with simple recipes for improving the Complexion, etc. Price by mail 30 Cents.

**The Gentlemen's Perfect Letter Writer, Or Hints and Helps To Letter Writing.** A Complete and Instructive Guide for the Correspondent, containing a very superior and original collection of Miscellaneous Business Letters; Business Letters of Introduction, Letters of Credit, Letters of Application for Employment, Letters of Application for increase of Salary, Copies of testimonials, or Letters of Recommendations, Familiar and Social Correspondence, Social Letters of Introduction, Congratulation and Condolence, Notes of Ceremony and Compliment, Ceremonial, Visiting, Official and Professional Cards. Rules for Conducting Public Debates and Meetings, Postal Rates and Regulations, Business Law and Business Maxims, Interest Tables, Titles and Forms of address, etc. Price by mail 30 Cents.

**The Ladies' Perfect Letter Writer And Guide To Correspondence.** Containing a very superior and original collection of Miscellaneous Letters and Notes, suitable for every occasion, together with a large amount of information in regard to spelling, Punctuation, Grammar, etc. Price by mail 30 Cts.

**Selections for Autograph and Writing Albums.** This Interesting Volume has been prepared to supply a need which has been long felt. It is a compilation of Verses both Original and Selected, and is arranged in such manner as to make each selection easily accessible. It contains Friendly, Dedication, Humorous, Floral Miscellaneous, and other Verses suitable for Inscription in Albums, on all occasions. Price by mail 30 Cents.

**A Complete Guide To Flirtation.** Containing Handkerchief, Glove, Fan and Parasol Flirtations, and a complete Language of Flowers. Price by mail 10 Cents.

**The Economical Cook Book, Or How To Prepare Nice Dishes at a Moderate Cost.** Containing nearly 500 carefully tried Recipes for Cooking Soups, Fish, Oysters, Clams, Meats of all kinds, Poultry, Eggs, Vegetables, Sauce for Meats and Puddings; Bread, Breakfast Cakes, etc., Pickings, Pies, Preserves, Pickles, &c., &c. Also a chapter on Cookery for Invalids. Price by mail 30 Cents.

**The Japanese Fate Book, Or The Wheel Of Gold.** A Complete Interpreter of Dreams, having also attached to each Dream its fortunate numbers; also Fortune Telling by grounds in a tea or coffee cup; how to read your fortune by the white of an egg, how to make your Lover or Sweetheart come, The Acorn Charm, Apple-paring Charm, to know how soon a person will be married, to know what fortune your future husband will have, etc. Price by mail 30 Cents.

**Hand-Book of Business; and Complete Guide to all Kinds and Forms of Commercial and Mercantile Transactions.** Including a Dictionary of all the Terms and Technicalities used in Commerce and Business Houses. Correct legal forms are given of Bills, Deeds, Notes Drafts, Cheques and Agreements, Receipts, Contracts and other instruments of writing constantly necessary to everyone, no matter in what calling he follows. Not only does it tell how to do business, but it is a complete Book of Legal Knowledge. Its use will save many a dollar in lawyers' fees, and save much uncertainty and embarrassment to all who have occasion to give or receive any article of writing. It tells how to do business, how to conduct Mercantile Transactions by Sea or Land, at Home or in Foreign Countries, how to keep a Bank Account, how to make out Notes of all Kinds, how to Write an Agreement, how to draw up Articles of Co-partnership, how to Write a Bond, how to find out Profit and Loss on Goods, how to Make out a Deed, how to Mark Goods, [private] how to Write a Contract for Building, how to Write a Lease for Lands or Goods, how to Make Reports for all kinds of Associations, Concern and Business. The Book is indispensable to everybody. All will find matter especially suited and needed by them. To the young man desirous of bettering his condition in life by engaging in merchandise, this book is worth its weight in gold. It is just what he needs. Its instructions will enable him to become proficient in the language mercantile men, and also render him thoroughly competent to perform any duties that may devolve upon him, in the Banking House, the Store or the Office. Price by mail 25 Cents. 3 copies 50 cts. get two of your friends to send with you and you will have your own book free.

World Manufacturing Co., 122 Nassau Street, New York.

## SPLENDID IMITATION GOLD WATCHES,

FOR TRADING AND SPECULATING. ONLY \$6.

The Watch which we offer for sale is a good imitation of a Gold Hunting Cased Watch in color and appearance. The metal is a composition of other metals, so closely resembling gold that it is difficult to detect the difference except by chemical test. The works embrace the celebrated IMPROVED AMERICAN MOVEMENT and EXPANSION BALANCE. The case is Massive, Strong, and Exceedingly Handsome. The illustration is only half size and will give you only a faint idea of our justly celebrated Watch. This watch you can sell for \$15 to \$20, and take any goods you can find a market for in exchange. We will enable you to make a profit of \$10 to \$15 on each watch. We have also a pocket watch, of the same kind, which is also a good imitation of a Gold watch, and highly remunerative field of business. We will send the watch by registered mail free of all charges on receipt of \$6 and guarantee safe delivery or we will send it C.O.D. on receipt of \$2.00 on account. Splendid IMITATION GOLD CHAINS only \$1 each. Medalion Charms 50 cents extra. This watch is extensively advertised and sold by other firms at \$10 each. Don't pay Ten Dollars when we will sell you precisely the same watch for \$6. We sell at wholesale price, in order to give you a chance to try and sell them, knowing you will order a number at a time when you find they are really good and valuable. **World Manufg Co. 122 Nassau St. N. Y.**

Watch at wholesale price, in order to give you a chance to try and sell them, knowing you will order a number at a time when you find they are really good and valuable.

## A Printing Office for One Dollar!

**THE WORLD'S SOLID RUBBER FAMILY FONT** for marking Linen, Cards, Books, etc. Combines the convenience of metal type, with the flexibility, durability and elegance of the rubber stamp. **FOR ONE DOLLAR** you get everything shown in the cut, with 125 to 150 letters, ink, Holder, Pads, Two-cases etc. all in a neat box with directions, the price you would pay for a single name. **Style of FONT No. 62. Mrs. S. R. Penfield**

**Font No. 63. Jack Harkaway, et. A B C**

**A BIG THING.** With the outfit we send by mail for One Dollar, any boy or girl, man or woman, can print 500 cards an hour, visiting or business, and can go in any residence or store and take their order and print their cards while there. In ten minutes you can print a pack of cards and deliver them. The whole outfit can be carried in your coat pocket and you can travel over the United States printing cards in every city and village you pass through. If you will act as Agent for our Fonts, we will send you a complete font for 75 cents, post-paid, SPECIAL \$1.35. Price to all others \$1.00 each. Valuable catalogue of Agents' goods free. **World Manufacturing Co., 122 Nassau Street New York.**

## OLD GYPSEY MADGE'S FORTUNE TELLER.

**AND THE WITCHES KEY TO LUCKY DREAMS.** Every person's fortune far better than any Astrologer, Clairvoyant, or Medium can tell you. It foretells exactly what will happen to you in the future; it gives the true Secrets of Love, and how to manage, what to say, and what to do to gain the affections, the love, the heart and the hand of the person you desire to marry; it gives the Dictionary of Dreams, and how to interpret any dream as soon as you hear it. It tells you Rose, Rose, who your husband or wife will be; the Love Letter Charm; how to know the Sex of Children before birth; the Love's Charm; the only way to marry to know what fortune you will have; the Love's Charm; the only way to mutual; it tells you Lucy Days; Fortune telling by Cards; what you will be successful in; what your absent wife or husband is doing; what your future Destiny is; whether your Wife, Husband or intended is true to you; whether you will ever marry or not; whether you will have Money left you; whether your way will be successful in your love affairs; whether you will be a widow; whether you will die Rich or Poor; Seven Signs of speedy Marriage; Signs how to choose a good Husband or Wife; in fact there is no end to the mysterious revelations unfolded in its pages. Sample Copy, and Forms to Agents, sent by Mail, post paid, for 25 Cents, or Five copies to one address for \$1.00. Ask Four friends to buy one each, and get your own book free. **WORLD MANUFACTURING CO., 122 Nassau St., New York.**

## THE MYSTERY OF LOVE-MAKING SOLVED.

**OF AN EASY ROAD TO MARRIAGE.** Start Right and the Battle is Won! A man in love or a lady whose heart has been touched with the burning fire of True Love will find in this book strange Secrets that no friend could tell them, and an Easy Way to win the heart through Love's Intricate Pathway. It also contains many a recent hidden Secret that the Married should know. If a wife has a wayward husband, or feels that she is neglected, get this Book in his hands at once, and it will surely reclaim him to his first love. It starts while it teaches. It proves that the way to win is no longer a secret. If you follow this writer's advice failure to win the object of your choice is impossible. Send for this Book. It will pay you a thousand times its price. Every country, civilized and barbarous, has been unassailed to get **The Secrets of Love Making**. It will bring joy to thousands of both sexes, and cause more hearts and hands to be united in Marriage than all other instrumentalities combined. It is full of strange things, regarding Love Making which you never heard of before. If you are in love, and it is not reciprocated, this Great Book will open wide Love's barred door for you, and break down every barrier. Marvelous truths burst forth from every page, and the precious light of Love illumines every footstep, and makes Love's Pathway clear. Send Sample Copy, and Forms to Agents, sent by Mail, post paid, for 25 Cents, or Five Copies to one address for \$1.00. Ask Four friends to buy one each, and thus get your own book free. **WORLD MANUFACTURING CO., 122 Nassau St., New York.**

or Five Copies to one address for \$1.00. Ask Four friends to buy one each, and thus get your own book free.

## TELEGRAPHERS, SAVE YOUR GRIP! USE THE FLEXIBLE KEY-KNOB.

It Relieves the Muscles and is  
Pleasant to the Touch.

IT IMPROVES WRITING, LARGELY OVER-  
COMES STICKING OF THE KEY  
AND FACILITATES SENDING.

It Prevents Telegraphers' Paralysis,  
and enables those who are  
Afflicted with that Ter-  
rible Disease to "send"  
with but Little  
Difficulty.

No. 1 shows a Flexible Elastic Key-Knob, to be substituted for the present hard-rubber knob; it will fit any key. No. 2 shows an Adjustable Elastic Cover; it will fit any key-knob. No. 3 shows the Adjustable Elastic Cover fitted to the key-knob.

### INDORSERS OF THE FLEXIBLE KEY-KNOB.

The Flexible Key-Knob is indorsed by the following well-known Telegraphers:  
Gen. Anson Stager.  
A. S. Downer, Gen. Manager of the New York office.  
Thomas Dolan, Night Manager of the New York office.  
Thomas A. Edison, Menlo Park, New Jersey.  
W. P. Phillips, Assistant General Agent of the New York Associated Press.

E. C. Boillieu, G. F. Stewart, T. R. Taltavall, S. S. Schroff, L. B. McCarthy, Associated Press Operators; T. G. Kennedy, J. B. Gaynor and many other Western Union Operators.

#### THE FLEXIBLE KEY-KNOB AND COVER

Are in constant use on the Associated Press wire and fast Western Union circuits, and are giving universal satisfaction.

#### The following Letters explain themselves:

New York, May 23, 1878.  
A. S. DOWNER, Manager.—The Flexible Key-Knob is a GREAT SUCCESS. I never had such EASY sending as I have had to-night. Respectfully,  
H. H. HENRY.

Mr. W. J. BARRON.—Mr Henry is one of our most experienced Operators, and a person who would not give an opinion like the above unless the article had merit. He sends about 10,000 words per night.  
Yours, etc.,  
A. S. DOWNER.

New York, May 25, 1878.  
A. S. DOWNER, Manager.—The Flexible Key-Knob materially improves "light" writing, and it unquestionably renders continuous sending less fatiguing.  
Very respectfully,  
FRED CATLIN.

Mr. W. J. BARRON.—Fred Catlin is probably as good an Operator as this world produces.  
Yours, etc.,  
A. S. DOWNER.

New York, May 28, 1878.  
Mr. W. J. BARRON.—After using the Flexible Key-Knob daily for more than a month, I must say that it is a *decided success*. It makes sending much easier; enables me to make letters with facility that have heretofore given me trouble, and is a great help in sending for a long period.  
Respectfully,  
J. B. GAYNOR.  
W. U. Tel. Co. (Main Office).

Sent post-paid on receipt of price: No. 1, Seventy-five cents; No. 2, Fifty cents.

Canadian Orders ten cents additional.

Postage Stamps taken as cash.

ACTIVE AGENTS WANTED.

It is just what every Learner needs.

A. B. SMITH, General Agent,  
P. O. Box 5,055. 1,475 Broadway, N. Y. City.

THE

## American Bell Telephone Co.

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly, or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This Company desire to arrange with persons of responsibility for establishing

### DISTRICT OR EXCHANGE SYSTEMS,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as agents, for the purpose of establishing

### PRIVATE LINE

AND

### CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company, No. 95 Milk street, Boston, Mass.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## THE BISHOP GUTTA-PERCHA WORKS,

Original and only Manufacturers in the U. S. of

**PURE GUTTA-PERCHA GOODS,**

**422, 424, 426**

**EAST TWENTY-FIFTH ST., N. Y.**

ESTABLISHED IN 1847.

### S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description, under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA for Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds.

Submarine Telegraph Cables, 50 varieties, one to ten conductors.

Submarine Telegraph Canal Cables—any number of conductors.

Aerial and Underground Cables of all styles. Hemp armor covered.

Lead-Covered Telegraph Cables, one to seven conductors.

Office Cables, one to seventy-five conductors, gutta-percha and cotton-covered.

G. P. Insulated Wire of all sizes.

Fuse. Leading and Connecting Wires for submarine and mining purposes.

Marks' Compound Office Wires, various sizes, for office, underground, and outdoor use.

G. P. Office Wire, cotton-covered.

Flexible Elevator Cables, any number conductors desired, of every style, and for all purposes.

Compressed Electric Cotton and Linen Double and Triple Covered Cordage any style or pattern.

Burglar Alarm, Call Bell and Annunciator Wires, double cotton wrapped and saturated with any preparation.

Magnet Wires, copper and German-silver, cotton, silk, and fibre covered.

Copper Wires, specially covered for electrical lightning purposes.

Telephone Flexible Cords and Magnet Wires, finest and best manufactured.

Agents for Reception of Orders and Sale of Goods:

L. G. TILLOTSON & CO., 5 & 7 Dey Street, New York.

WILLIAM HEATON, 503 Chestnut Street, Phila.

All orders to the Factory should be addressed:

W. W. MARKS, Superintendent,

422 East Twenty-Fifth Street.

## THE DEAF **HEAR**

BY THE USE OF

### Peck's Patented Artificial Ear Drums.

Not observed in use, and comfortable to the ear. Cushioned, ventilated and harmless, and perform the office of the natural drums. The only perfected and patented Ear Drums. Also patented in Europe and Canada. Send for Treatise on the Ear; mailed free.

## Leclanche Battery.

(PATENTED.)

"Prism Battery" Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of

**SIMPLICITY AND EFFICIENCY**

**In Electric Open Circuit Batteries.**

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

**ADOPTED AND USED BY THE**

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and removed than any other battery. Beware of

**Infringements and Worthless Imitations.**

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

**The Leclanche Battery Co.**

40 West 18th St., New York.

Or L. G. TILLOTSON & Co., 5 and 7 Day street, New York.

## American Popular Dictionary

The following order is a sample of what we are receiving every day, and shows how the American Popular Dictionary "takes," both among Telegraphers and outsiders:

"Package of nine American Popular Dictionaries received and delivered. All seem well pleased with them. Please send me by Express same as before, ten more copies of the Dictionary and one copy "Wired Love."

Yours respectfully,

Andover, O., Aug. 5th.

A. W. GATES.

Many of our readers could sell a large number of the Dictionaries if they only tried. Liberal discount to agents. Send \$1.00 for a sample copy, and see how many orders you can get.

To any one sending us \$3 for three copies, we shall send an extra copy free and postage pre paid.

W. J. JOHNSTON, Publisher,  
P. O. Box 3,332. No. 9 MURRAY STREET, N. Y.

### TANTALUS.

When lovely Mary speaks to me,  
And sets my foolish heart a-thrilling,  
Life has no gift I would so prize  
As just to look in those clear eyes ;  
And she—I think she would be willing.

Her kindly speech, her pleasant ways,  
Fill all my days with sunny weather ;  
To hold her hand in mine, to share  
The faint, shy fragrance of her hair—  
Earth would be Eden altogether !

Alas ! we work by telegraph,  
I and this dainty, far-off Venus,  
And when we hold a tête-à-tête  
We have—Oh, irony of Fate !—  
Two hundred miles of wire between us !

### The Telephone Convention.

The semi-annual convention of the National Telephone Exchange Association, formed last September, at Niagara Falls, for the purpose of collecting, preserving and protecting all matters of importance to telephone interests, was called to order at 10:45 A. M., on Tuesday, April 5, at the Grand Pacific Hotel, Chicago, Geo. L. Phillips, President, in the chair.

The members of the association are those who hold licenses or authority from the American Bell Telephone Company. The officers are George L. Phillips, of Boston, President; H. H. Eldred, of New York, Vice-President; D. I. Carson, New York, Treasurer; Morris F. Tyler, New Haven, Secretary. The executive committee consists of George L. Phillips, Boston; F. G. Beach, Dubuque; W. H. Eckert, Cincinnati; George L. Wiley, New York; C. N. Fay, Chicago. Advisory committee is C. S. Beardsley, Newburgh, N. Y.; George C. Maynard, Washington, D. C.; Noah Hodge, Jr., Akron, O. The following is a list of the telephone

### COMPANIES OR EXCHANGES REPRESENTED,

with the names of the delegates:

Akron, O., Geo. G. Baker.  
Allaire & Reyburn, Peoria, Ill., W. S. Reyburn.  
A. D. T. Co., Louisville, Ky., J. B. Speed and H. N. Gifford.  
A. D. T. Co., Erie, Pa., H. L. Wood.  
A. D. T. Co., Syracuse, N. Y., Jervis Myers.  
Auburn & Newburgh, N. Y., Tel. Ex., H. L. Storke.  
Bell Tel. Co. of Phila., Pa., W. D. Sargent.  
Bell Tel. Co. of Ill., C. N. Fay and L. B. Firman.  
Bell Tel. Ex., Elmira, N. Y., W. N. Eastabrook.  
Bell Tel. Co. of Buffalo, N. Y., E. J. Hall, Jr.  
Bell Tel. Co. of Mo., St. Louis, G. F. Durant and L. M. Fishback.  
Bloomington (Ill.) Tel. Co., W. K. Morley.  
Bradford, Pa., Tel. Ex., Frank A. Newell.  
Central Mass. Tel. Co., Marlborough, Mass., M. Clark.  
Central D. & P. Tel. Co., Pittsburgh, Pa., Henry Metzger.

City & Suburban Tel. Association, Cincinnati, W. H. Eckert.  
Clinton & Lyons Bell Tel. Co., Clinton, Ia., J. K. Balch and B. C. Root.  
Columbus (Ohio) Tel. Co., C. W. Ross.  
Connecticut Tel. Co., New Haven, Conn., H. P. Frost, C. L. Mitchell and M. F. Tyler.  
Danbury (Ct.) Tel. Co., G. L. Phillips and H. N. L. Bernard.  
Denver (Colo.) Tel. Ex., F. O. Vaille.  
Doan & King, Jacksonville, E. J. King.  
Dunkirk (N. Y.) Tel. Co., W. D. Wann and H. Monroe.  
J. D. & J. G. Elwood, Joliet, Ill., J. G. Elwood.  
Evansville (Ind.) Tel. Co., E. S. Babcock, Jr., and E. T. Baker.  
C. H. Haskins, Milwaukee, Wis., C. H. and H. C. Haskins.  
Hawkeye Tel. Co., Cedar Rapids, Ia., Geo. B. Engle, Jr.  
Jamestown (N. Y.) Tel. Ex., Marvin Smith.  
Leavenworth (Kan.) Tel. Co., D. M. Swan.  
Marshalltown (Ia.) Tel. Co., C. W. Ward.  
Metropolitan T. & T. Co., N. Y. City, G. L. Wiley, C. E. Chinnock and M. W. Doran.  
Nat'l Capital Tel. Co., Washington, D. C., B. E. Sunny.  
Omaha Electric Co., Omaha and Council Bluffs, L. H. Korty.  
Pacific Bell Tel. Co., San Francisco, Cal., J. I. Sabin.  
J. S. Ross, Nashville, Tenn., J. S. Ross.  
St. Joseph (Mo.) Tel. Co., J. A. Corby.  
Springfield (Mass.) Tel. Co., G. T. Perkins.  
Springfield Tel. Co., Akron, O., W. J. Baker.  
Southern Mass. Tel. Co., New Bedford, Mass., C. W. Clifford.  
Southern Ohio Tel. Ex. Co., Portsmouth, O., S. Ivers and E. V. Cherry.  
Southwestern Bell Tel. Co., Little Rock, Ark., L. H. Roots and J. N. Keller.  
Telegraph and Telephone Construction Co., Detroit, Mich., W. A. Jackson.  
Union Tel. Ex. Co., Norwalk, O., D. A. Baker, Jr.  
Waterbury, Conn., Automatic Sig. Tel. Co., A. M. Young.  
Western Mass. Tel. Corporation, Pittsfield, Mass., Geo. H. Cary.  
Western Telephone Co., Chicago, Ill., F. G. Beach.  
Youngstown Telephone Co., Akron and Youngstown, O., N. Hodge.

Honorary members: F. S. Potter, Secretary Telephonic Signal Corporation, Pittsfield, Mass.; W. A. Childs, Manager Law Telegraph Company, New York; Hugh Neilson, Superintendent Toronto Telephone Exchange; E. T. Gilliland, Gilliland Electric Manufacturing Company, Indianapolis, Ind.; E. F. Phillips, Providence, R. I.; C. B. Hotchkiss, representing A. G. Day, New York.

Messrs. Theodore N. Vail, General Manager, and Robert S. Boyd and Frank B. Knight, Special Agents American Bell Telephone Co., were at the Grand Pacific, but took no active part in the convention business.

The following were also present:

E. M. Barton, Secretary Western Electric Manufacturing Co., Chicago; Geo. H. Bliss, President Telephonic Signal Corporation, Pittsfield, Mass.; J. H. Bunnell, New York; J. H. Longstreet, New York; E. Ward Wilkins, representing Partrick and Carter of Philadelphia; W. E. Balch, representing the Union Porcelain Works, Greenpoint, N. Y.; Charles A. Rolfe, Superinten-

dent Sales, Utica Fire Alarm Telegraph Co., Utica, N. Y.; W. J. Johnston and J. R. Calder, of THE OPERATOR; Paul W. Bossart, Kansas City, Mo.; W. H. Kelsey, Milwaukee, Wis.; W. W. Smith, Indianapolis, Ind.

No opening address was made by the President, as this was an adjourned meeting from one held at Niagara Falls, September 7th-10th, 1880. The most important business transacted was the receiving of reports of the standing committees. Some of these reports and the discussions they evoked were of a most interesting character. The convention held five sessions in all—a morning and an afternoon session on Tuesday, and a morning, an afternoon and an evening session on Wednesday. At 10:45 P. M. on Wednesday, the convention adjourned, to meet at Saratoga Springs, N. Y., on the Tuesday following the first Monday in September (6th) next.

### COMMITTEE REPORTS.

The standing committees are thirteen in number, as follows:

**LAWS.**—M. F. Tyler, New Haven, Conn.; N. Hodge, Akron, O.; N. H. Watson, Buffalo, N. Y.

**CENTRAL OFFICE (SYSTEM AND APPARATUS).**—C. N. Fay, Chicago, Ill.; W. H. Eckert, Cincinnati, O.; John M. Wheeler, Toledo, O.

**LINE CONSTRUCTION AND MAINTENANCE.**—Robt. Brown, New York City; C. W. Ross, Columbus, O.; R. M. Bailey, Tyrone, Pa.

**CABLES.**—W. H. Pope, New York City; W. H. Boffinger, New Orleans, La.; Chas. H. Haskins, Milwaukee, Wis.

**CALL-BELLS AND CONNECTING LINES.**—H. B. Lytle, Providence, R. I.; Geo. G. Baker, Akron, O.; Jas. S. Ross, Nashville, Tenn.

**TELEPHONE SUPPLIES.**—W. A. Jackson, Detroit, Mich.; H. N. Gifford, Louisville, Mo.; J. P. McKinstry, Cleveland, O.

**ELECTRICAL DISTURBANCES.**—W. D. Sargent, Philadelphia, Pa.; Chas. H. Haskins, Milwaukee, Wis.; C. E. Chinnock, New York City.

**AUXILIARY SYSTEMS.**—Geo. C. Maynard, Washington, D. C.; Henry Metzger, Pittsburgh, Pa.; W. H. Hamilton, Albany, N. Y.

**TELEPHONE JOURNAL.**—H. L. Storke, New York City; Samuel Ivers, New Bedford, Mass.; J. J. McMicken, Hamilton, O.

**EXCHANGE STATISTICS.**—F. G. Beach, Chicago, Ill.; C. N. Fay, Chicago, Ill.; E. J. Hall, Jr., Buffalo, N. Y.

**SUBTERRANEAN LINES.**—C. H. Haskins, Milwaukee, Wis.; H. W. Pope, New York City; W. H. Boffinger, New Orleans, La.

**TELEPHONE EXCHANGE RATES.**—E. J. Hall, Jr., Buffalo, N. Y.; M. Greenwood, San Francisco, Cal.; Geo. F. Durant, St. Louis, Mo.; Geo. H. Twiss, Columbus, O.; M. J. Meyers, Syracuse, N. Y.

**WAYS AND MEANS (INCLUDING PRINTING).**—H. H. Eldred, New York City; Samuel Ivers, New Bedford, Mass.; W. S. Reyburn, Peoria, Ill.

Mr. C. W. Ross (Line Construction and Maintenance) reported verbally in favor of the use

of galvanized steel instead of galvanized iron wire, the advantages to be gained being strength, lightness, and low first cost. He advocated the use of No. 14 steel instead of No. 12 iron. A discussion followed upon the comparative virtues of steel and iron wire, and it was generally agreed that the former oxidized more rapidly than the latter. The question as to the superiority of No. 12 or No. 14 wire was discussed at length, opinions being given and experiences related by Messrs. C. H. Haskins, of Milwaukee; G. L. Wiley and H. L. Storke, of New York; W. D. Sargent, of Philadelphia, and others. In answer to an inquiry by a delegate, the Chair called upon Mr. Wiley to say whether the larger or smaller gauges of iron wire were the first to break in the January sleet storm in New York. Mr. Wiley stated that no difference had been noticed; but this was to be accounted for by the fact that all the wire of the larger sizes, Nos. 9 and 11, in use at that time by the Metropolitan T. & T. Co. was older—had been up for a much longer time—than the No. 12 wire; and, therefore, no satisfactory comparison could be made. The Metropolitan Company used no No. 14 wire.

Mr. Sargent stated that they had used No. 14 galvanized iron wire in Philadelphia ever since the telephone was introduced, and attributed much of the success of his company to this fact, the small wire costing less, creating less inductive trouble and being easily and readily handled, especially on the housetops, where their wires are principally situated. He had commenced using No. 14 wire in 1873 in connection with the American District Telegraph Company of Philadelphia, and believed the life of a wire of this gauge to be not less than six years under the average conditions in large cities. In Philadelphia they have spans of 450 feet on fixtures at present sustaining 60 wires, and during the sleet storms in January comparatively few wires were broken, and in this particular span but six. Latterly they have been using steel wire with very good results, but he was not prepared to say that steel wire was any better than iron, except in the matter of economy. The light wire puts less strain on the fixtures, and admits of lighter timber being used, an important feature on housetop work. During the past winter but one fixture was broken by sleet and ice, and in that case the guys broke first. Wires put up in 1877 are apparently as good today as they were then, giving no trouble from breakage or bad joints.

On motion, the Secretary was directed to dispose of the 500 copies printed of the report of the proceedings at the Niagara Falls convention, at the rate of 50 cents per copy to members of the association and \$1 to non-members.

Mr. Speed, of Louisville, asked for information on the subject of insulators. Mr. W. E. Balch advocated porcelain insulators as better and ultimately cheaper than any other kind. It was objected that on account of climatic influences porcelain insulators could be used in Europe but not in this country. This view of the subject was taken by many of the delegates. Messrs. W. A. Childs, C. H. Haskins and C. W. Ross expressed their views on the subject. After the report of the Committee on Line Construction had been fully discussed and adopted, the meeting took a recess.

The afternoon session was held in the appellate court-room, and the convention was called to order at 3 o'clock. Three applications for membership were entertained and favorably acted upon. The same action was taken with regard to one application for honorary membership.

This preliminary business over, a delegate asked for information upon the advisability of using lightning-arresters in the towers. The gentleman making the inquiry said that he had given up their use for fear of fire. There was a diversity of opinion on the subject. Mr. E. J. Hall, Jr., of Buffalo, called attention to a case in which an operator in the Rochester Exchange, operated by his company, received an extremely severe shock while using the telephone during a thunder-storm. Had the lightning arresters been in use, this would not have occurred, and the protection to property would have been much greater. Mr. Ross had had no accidents, and but very few spools or transmitters burned out

by lightning. Mr. Sargent had lost transmitters but no spools. Mr. G. F. Durant, of St. Louis, and others also gave opinions. The matter was then dropped to give place to the subject of cables. Mr. C. H. Haskins, of Milwaukee, made a brief verbal report on the Brooks cable, a system used by himself with success for short distances in Milwaukee.

Mr. Sargent, of Philadelphia, said that the Philadelphia Bell Telephone Company had used a cable of eighty-two wires covered with cotton, twisted in pairs, and insulated with a composition of rosin and coal oil. The twin wires were grounded, the whole bunch was inclosed in a lead pipe, and the insulating composition was forced through the pipe hot and allowed to cool. The Philadelphia cable was about 500 feet long and perfectly flexible. It has been in constant service since last May, and has given no trouble whatever. It was manufactured by David Brooks, Jr., of Philadelphia. A 50-wire cable—that is, 50 working conductors—of this description can be furnished for from 65 to 75 cents per foot. He desired to call attention to the mode of stringing or suspending the cable over the house-tops. The No. 12 wires were stretched from one fixture to another as tightly as possible, two of the spans being from 80 to 90 feet in length, across streets. A rope was then thrown across and the end of the cable attached to it, a loop of No. 14 wire holding the cable tightly and sliding on the suspension wire was then attached at every foot as the cable was drawn over. This plan keeps the cable close to the suspension wire, and makes a neat job. There is no evidence of cutting or chafing by the suspending loops. Of course there is no strain on the cable itself. This is believed to be the first heavy lead-covered aerial cable ever erected.

Mr. Wiley stated that in New York the Metropolitan company had in operation a similar cable. It was 1,655 feet long, contained 40 wires, weighed a pound per foot, and cost 60 cents a foot. It was made by David Brooks, Jr. It was, thus far, a satisfactory anti-induction cable.

Mr. Chinnoek, of New York, said that there was in operation in New York a number of miles of a cable of his make that was of a not very different construction. Each conductor was covered with lead or tin-foil. Such cables were in use over the East River bridge and one in the North River was 5,200 feet long. By the use of these cables "induction"—so-called—was reduced to a minimum.

Mr. C. H. Haskins referred to the "Foucault" anti-induction cable used some years ago by the Gold and Stock Telegraph Company of New York, and inquired whether it was still in use. Mr. Wiley answered that its use had been abandoned three years ago and the cable taken down.

Mr. Chinnoek called attention to the fact that the first "anti-induction" cable used in connection with telephony was a Chinnoek cable 3,600 ft. long, put up by the Bell Telephone Company of New York, on the East River bridge between Brooklyn and New York. It worked perfectly and is working to-day.

Mr. E. M. Barton discussed the question of the practicability of working underground telephone cables. During the recent summer the speaker was in Marseilles, France, where there were considerable lengths of underground telegraphic cables. By the courtesy of the company he was allowed to undertake certain experiments. They were so far successful that he was convinced that, up to the distance of five miles, it was practicable to use underground cables for telephonic uses. No appreciable retardation or static induction was shown in his test of three miles.

Mr. Patterson read the list of a very large number of subterranean and submarine cables of the Brooks pattern that had been laid for telegraph and telephone companies. These cables were of all lengths, from one of over six miles to those of a few feet. After the description of numerous other kinds of cables, a written report on subterranean cables by H. W. Pope was read by Mr. Charles H. Haskins. The writer favored the underground plans of Mr. Sewall, of Albany, and of Superintendent of Construction Wm. Mackintosh, of New York, but added that since writing the body of the report he had been shown a system invented by Mr. P. B. Delany, which, in his opinion, was likely to revolutionize the whole matter of subterranean cable laying, by

reason of its simplicity and cheapness. As the patents had not yet been secured, he was not permitted to describe the system.

Messrs. Geo. G. Baker, of the Committee on Call-bells and Connecting Lines; W. A. Jackson, of the Committee on Telephone Supplies; W. D. Sargent, of the Committee on Electrical Disturbances; Henry Metzger, of the Committee on Auxiliary Systems; H. L. Storke, of the Committee on a Telephone Journal, and E. J. Hall, Jr., of the Committee on Exchange Statistics, were called upon for reports. They all stated that they needed further time. The convention then adjourned to meet at 9 A. M. on Wednesday.

On Wednesday morning the Association resumed its sessions, President G. L. Phillips in the chair. On motion of Mr. Speed, of Louisville, an assessment of \$5 on each member was ordered to defray the incidental expenses of the convention. It was also decided that the next meeting of the Association should be held in New York in September. The vote on the place of meeting was, however, afterward reconsidered, and Saratoga substituted for New York.

The first paper of the day was that on "Auxiliary Systems," presented by Mr. C. C. Haskins, of Chicago. Mr. Haskins gave a description of the various messenger, fire and police alarm systems in use. He said that the system of special calls could be further extended, and that it had been a great success, as every citizen of Chicago using the system would probably admit.

Mr. M. F. Tyler, of New Haven, Conn., said that they had a system of regulating time all over the State, which was found to be of great value to factories and the like. In Buffalo, Mr. Hall stated that theatre diagrams were kept in the central telephone office and orders for seats filled, the tickets being delivered by messenger.

Referring to the subject of the telephone as applied to fire alarm purposes, Mr. Durant, of St. Louis, said he thought the establishment of the Gamewell or a similar system of fire and police telegraphs should be encouraged by telephone companies, in preference to having the alarms sent in by telephone. Mr. Durant went on to say that in this regard telephone companies were undertaking a good deal of extra work without pay.

Delegates from Cincinnati, Milwaukee, Buffalo and other cities rejected this view of the matter, and held that the companies received an equivalent in the way of use of poles, right of way, and other things which made the question of pecuniary compensation a secondary one.

Mr. Eckert said that about 70 per cent. of the day alarms in Cincinnati came in over the telephone wires. Police alarms were also transmitted in the same manner. The telephone company had secured the co-operation of the Police and Fire Departments, and had found the system to be mutually advantageous. Telephone companies required rights of way, and could not afford to antagonize either the Fire Department, the insurance agents or the citizens.

Mr. Sabin said that in San Francisco they had established a bureau of general information for the use of subscribers. Points as to happenings in the city, election news, orders for goods, inquiries as to whether a person was staying at a certain hotel, all came in over the wires. A record was kept of the orders of customers, and a charge of five cents made for each call.

Mr. Geo. B. Engle, of Cedar Rapids, was appointed a committee to prepare a paper on fire alarms for the next convention.

Dr. Baker presented the report of the Committee on Call-Bells and Connecting Lines. He said the battery system had been abandoned by almost all exchanges, in favor of automatic magnet bells.

Mr. Jackson read a report on "Office Supplies," showing the merits and shortcomings of various kinds of batteries and other apparatus.

Mr. Fay said that figures in regard to office work had not been obtained, partly because of the engagements of members of the Committee and partly because no uniform system of statistics had been prepared. He suggested that exchanges be requested to furnish information for the next meeting of the Association, as follows: Number of wires in each office; number of operators employed; pay-roll of employees of each office; time employed in making connections; delay in disconnecting.

Mr. H. C. Haskins said an attempt had been

made by the American Bell Telephone Company to procure just such statistics, and wanted to know what had become of the figures thus obtained.

The Chair said he believed the American Bell Company was perfectly willing to furnish the Association with the figures as soon as they were prepared. But the trouble was that the reports were incomplete and by no means uniform. The American Bell Company was also engaged in experimenting with cables, and the result of their experiments would doubtless be of great value to the exchanges.

At this point the Association took a recess until 2:30 P. M.

Laws and rates were discussed in executive session in the afternoon, and very valuable figures and statistics given by the committees on these subjects. Mr. Hall, of Buffalo; Mr. Eckert, of Cincinnati; Mr. Sabin, of San Francisco; Mr. Durant, of St. Louis; Mr. Tyler, of New Haven; Capt. Hodge, of Akron, all gave valuable statistics or opinions. "Hall's Toll and Ticket System," as used in Buffalo, received much commendation.

Mr. Eckert, of Cincinnati, presented a report on central office statistics, and Mr. Fay, of Chicago, and Mr. Sargent, of Philadelphia, gave figures in the same line. It appeared that in Chicago and Cincinnati the average number of conversations per day to each subscriber was six. A recess was taken from 6 to 8 P. M., and at the latter hour the convention was again called to order, Mr. Wylie Smith, of Indianapolis, in the chair.

Mr. Sargent, of Philadelphia, presented the report of the Committee on Electrical Disturbances. One of the greatest troubles in telephoning was leakage, and there was need of much improvement in the matter of insulation. Devices had been tried for the prevention of leakage, but none had met with any great degree of success.

Mr. Haskins, of Milwaukee, said that in Europe they used an iron pin on the cross-arm, and were able to secure better grounding. There was great trouble from iron-rust on ground-wires in this climate. Grounding by means of a gas-pipe was an imperfect business, for the continuity of metal was broken by the red lead and other substances used at the joints. There was trouble also arising from the reflex action of one wire upon another; and whatever care might be taken this could not be entirely overcome. The speaker believed the grounding of wires used for electric lights upon the same water-pipe used for grounding telephone lines would result in trouble to the latter.

Mr. Chinnock, of New York, described the operation of lines running from New York to Coney Island, comparing them with lines to Williamsburgh. Water-pipes connect the latter place by means of the East River and the bridge, but Brooklyn water-pipes do not extend to Coney Island, and to this fact he attributed the great difficulty of securing lines clear of induction to Coney Island, while to Williamsburgh, where there were water-pipes, the induction was much less. He held that the earth is not a reservoir of electricity, and is a good or very bad conductor according to the artificial conductors which the current was able to find in its passage.

A general discussion followed in regard to the best means of securing reliable grounds. Mr. Haskins said that this was of the first importance, and that accidents caused by lightning were almost always found to occur where this was neglected. In cities the ground wires should be soldered to the gas or water-pipes, and in the country they should be led to wells. It was not sufficient to simply conduct them to the earth, but the limit of permanent moisture must be reached.

Mr. Frank Newell, of Bradford, Pa., gave an interesting account of experiments made by him in the substitution of tin-foil for solder. He simply covers joints in his iron or copper wire with one thickness of tin-foil, and has found that after months of exposure to heat, cold and moisture, the joint remains perfectly protected and the wire bright under the tin-foil. The cost of this mode of soldering would be trifling.

Mr. Haskins explained, with the aid of a diagram, the exchange system devised by his son, Mr. H. C. Haskins, and after answering many inquiries invited all present to go to Milwaukee the next day and see the system in practical operation. The invitation was accepted by a

number of delegates. The system referred to will be fully described in the next issue of THE OPERATOR. After considerable informal interchange of opinions the convention adjourned and some of the delegates returned home on the early morning trains on Thursday, but many remained examining the manufacturers' exhibits, the Chicago telephone exchange systems; the factory of the Western Electric Mfg. Co., and the fire and police telegraph systems.

The information obtained at the convention and the general interchange of views are considered to be of great value to those interested in the telephone business. The manufacturers' displays were not the least important feature of the occasion. We hope next issue to be able to give a full report of the exhibits, with illustrations of the novelties shown.

#### The Consolidation—Suits and Counter-Suits—Screwing up the Vise.

Although Judge Barrett denied the motion for a permanent injunction, and dissolved the temporary injunction against the consolidating companies, the ways of the new Western Union have not yet become paths of pleasantness and peace. Litigation in one shape or another continues to fret the minds of the men who have united the great telegraphic systems of the country.

Our last issue, on the 1st inst., left three series of motions to be heard in the Superior Court Chambers, in the suit of William S. Williams against the Western Union. The principal feature in these motions is that the American Union and Atlantic & Pacific Companies seek to be made parties to the suit, as co-defendants with the Western Union, in order, as they say, to protect their rights under the agreement of consolidation; claiming that, as they have already delivered their property to the Western Union, they will have no remedy if the latter company be enjoined from carrying out the agreement of consolidation.

These cases were argued on the 4th inst., when they were submitted to Judge Spier, and the formal trial of the suit was set down for Monday next, April 18.

Judge Sedgwick's injunction restraining the issuance of a stock dividend of \$15,526,590 to the stockholders continues in force.

The "Anti-Monopoly League" is still hard at work building up branches in the various States and threatening to arouse the people to the adoption of extreme measures against the abuses of uncontrolled corporate power.

In the Pennsylvania Senate, on the 5th inst., Senator Hall's "Anti-Consolidation Telegraph" bill occupied almost the entire time of the session. This is the bill to escheat to the Commonwealth the telegraph lines and property of telegraph corporations, associations and companies which violate the provisions of the constitution prohibiting the consolidation with or the holding of a controlling interest in the stock or bonds of a competing line of telegraph, or the acquisition by purchase or otherwise of any other competing line of telegraph. The bill was finally passed by vote of 27 yeas to 10 nays. It was also favorably reported in the House on the 12th.

The first indications of the coming pressure from competing companies have also begun to make themselves felt. The First Comptroller of the Treasury Department has recently rendered a decision upon a proposition received from the American Rapid Company to transmit messages at greatly reduced rates between the points with which they have connections. Notwithstanding that the rates for government telegrams were fixed by the Postmaster-General (June 30, 1880), the Comptroller says that the rates to be paid to telegraph companies now rendering service to the United States must conform to the lower rates offered by the American Rapid.

Meanwhile the promoters of consolidation have not been idle, but have kept on consolidating just as though law-suits and judges were unknown. Since our last issue the Atlantic & Pacific Telegraph Company has been literally swept out of existence, and many hundreds of operators and clerks have been thrown out of employment. The changes in some places, particularly in the clerical departments, have amounted to a complete revolution. The officers

of the new consolidated company claim that the wholesale removals and appointments are solely for the purpose of infusing "American Union" vitality into the old Western Union methods, and that they are governed by the exigencies of the new order of things. Their aim is, they say, to improve telegraphy inside of the office, as well as for the benefit of the outside public. There is a disposition shown in all large offices, in every city, to abolish the great distinction between "clerks" and "operators;" that is, to employ only clerks who are capable of working a wire. By this plan it is believed that in case of sudden emergency the various offices will never be at a loss, and that whenever there occurs any sudden pressure upon the operating room, the wires can always be manned by a draft upon the desks of the clerks.

In this city a very large number of operators and clerks have been thrown out of employment. Although there is considerable jesting and good-humored "resignation" on this state of affairs manifested by the men, one cannot be blind to an undercurrent of bitter feeling, which is not confined exclusively to the victims.

This revolution also appears to have been used as a pretext for a partial reduction of salaries. A certain class of men who have hitherto received \$75 and \$80 per month have been discharged, and in some cases reinstated—that is, they agree to perform the same daily tramp on the same tread-mill for \$15 or \$20 less per month. This state of affairs is to be deplored. Legally the company is right, but whether or not the reduced salary is sufficient to support an honest employé, to keep him honest, to keep him faithful and strictly moral, and to induce him to render in return anything more than perfunctory work, with the prospect of chronic pauperism staring him in the face, is a question which most concerns those who, holding the destinies of American telegraphy in their hands, profess themselves desirous of creating a model service; and to be striving, as did the late Mr. William Orton, to make "the telegraph in America the synonym of honor, enterprise and success."

#### Confessions of an All-Night Man.

The possession of illustrious talent is not a necessary qualification of the all-night man. He has little hope that his name will be written in telegraphic history as that of one who never "broke," nor is it probable that a presentment of his features will ever be enshrined in "Our National Portrait Gallery" as those of an operator who once vanquished the "automatic." His virtues are quiet and unobtrusive—any other kind would be superfluous, for there are none to note them.

At two o'clock the last press operator departs, the clatter of the sounders ceases one by one, and gives place to the seeming audible silence that follows the cessation of a penetrating noise such as that of the operating room, and the all-night man seems to be alone. I say seems to be, but *he* knows better. See that long, jagged, horizontal crack in the wall, apparently lined with a fringe of hairs, monotonously swaying to and fro, "ohne hast, ohne rast"—without haste and without rest. A physiologist would describe the crack as "ciliated," but the all-night man knows too well that those waving filaments are neither hairs nor cilia; they are the antennæ of a million cockroaches, and back of each pair of antennæ there is a corresponding pair of cold, glittering, remorseless eyes that are never lifted from his form, but follow his every movement throughout the night. As he passes from one end of the room to another, he feels those million pairs of eyes turn slowly in their sockets to keep him in view, and he shudders. Sometimes he cannot endure it; he makes a sudden sally toward them, and the swaying antennæ instantly vanish, but in a moment they are all back. Their owners never venture forth in his presence, and he wonders on what they subsist, for the operators have long ago become too

shrewd to share their luncheon with them, and there is nothing else in the office edible. The newspaper office cockroach can hold nightly high revel over the contents of the editorial paste-pot, but *Blatta telegraphica* is without visible means of support, unless, indeed, he can live and thrive on the galvanic current alone, "Like the *acarus* bred in Crosse's flint-solution."

To *Blatta telegraphica* is due the anomalous fact that no all-night man has ever been known to sleep while on duty; it would be impossible with the consciousness of all those pitiless eyes upon him. Were such a thing to happen, the battery might drop off one of the railroad wires, and there being no one awake to replace it, great detention might be caused to trains, involving delay to the U. S. mails and other consequential damages. Hence it will be seen that, like many another humble organism, *B. telegraphica* serves a wise purpose in the economy of nature.

Sometimes, though, the all-night man stretches himself upon one of the tables to rest. Then a lot of mice emerge from somewhere, and a diminutive circus performance takes place. All at once the silence is broken by a telegraphic voice at his elbow, which asks, "Did you see the girls to-day?" and another replies, "Yes, they told me to tell you to —" It is two railroad operators, who have come to a commercial wire to have what they call a "buzz." Their conversations always begin thus abruptly, probably because they have arranged the preliminaries on their own wire. The all-night man has no sympathy with such callowness; he "turns them down" immediately, and resumes his attitude of repose.

Presently it breaks out afresh in a far corner of the room. Now it is an extract from a country newspaper transmitted helter-skelter, with fine scorn of spaces, in a style that might make the angel Morse weep. After a moment it ceases for a brief interval, then is resumed for another moment, and so on. It is a nascent Eitemiller at some rural railway station, timing himself to ascertain how many words he can transmit in one minute, and dreaming of the proud hour when he shall wield the key of a press wire in a great city office.

A pitying smile curls the lip of the all-night man for an instant, as he reflects how much better off that ambitious plug is in his present position, if he but knew it, than he would be in the one he covets. Here, in this office, where the all-night man stands thirteenth on the list of candidates for promotion to *daylight work*, are thirty-five operators, whose intelligence, diligence and good habits, if applied for the same length of time to commercial or industrial pursuits, ought to have put most of them in a fair way of acquiring a competency, whereas they have now little prospect of ever being other than as they are. It is a by-word in the office that "few die, and none resign." On the other hand, on the very railway—a western one—where that aspiring youth is wrecking the Morse code, two of the general officers of the company are old operators, three ex-operators hold subordinate but responsible and remunerative positions, four of the best paying agencies on the road are filled by men who graduated at the key, and there is not an operator on the line who has not some advancement to look forward to, if worthy of it.

This train of thought recalls to the all-night man the memory of a friend of his youth, who began life in what might well seem to be unpromising circumstances—as operator at a little station whose only right to be was the presence

there of the company's repair shops. Having no other place to pass his spare time, he frequented the master-mechanic's office, picked up a knowledge of mechanical drawing and the use of tools, abandoned the key for the workbench, and is now foreman of a flourishing manufacturing establishment, with an assured future before him.

It is not surprising that the all-night man is a pessimist, and takes a gloomy and cynical view of men and things, for his dealings are with the dark side of life. The sweet influence of woman holds little sway over him, for those of the gentler sex with whom he comes into contact during his hours of duty are justly objects of suspicion, as are also many of the males. It is a nightly occurrence for some inebriate, who has been ejected from the drinking saloons at midnight, attracted by the office light, to pound on the door and demand wherewith to quench his raging thirst, under the delusion that he has found an all-night groggery.

There are exceptional cases that appeal to his better part. One morning, between two and three o'clock, there entered the office a person in whom the all-night man recognized at once the proverbial "gentleman and scholar." His language was refined, his attire faultless. He was in distress, the train on which he had just arrived had been delayed some hours, his friends lived far in the suburbs, he could not disturb them at that unseemly hour, his funds were exhausted—would the all-night man kindly lend him five dollars until the next night, to enable him to stop at a hotel? He would leave, as a pledge, his topaz ring, with his initials engraved on the inside, the gift of a dear friend. The all-night man smiled. Here was an unsophisticated person, indeed, who imagined that an all-night man might be the possessor of five dollars! He blushed to confess to the handsome stranger that all that was left of his last month's wages was a paltry two dollars. If that would be of any service—? Need I say more? The all-night man had more hair on his crown and less on his chin than he has now. He hesitated to take the ring—it seemed so mean to take it—but he did want to wear it, just for one night. He can wear it now whenever he wants to, but he never does. Its intrinsic value is about two cents, but it is worth far more than that to the all-night man; in fact, money would not buy it now; for it is all that is left him of the sweet innocence of youth.

There was one occasion which the all-night man will always recall with pride—the time when he had as guests, for a whole week, a telegraph president and a distinguished electrician. Think of that, ye plugs—an all-night man hobnobbing with a telegraph president and a world-renowned scientist! Well, he was not exactly world-renowned at that time; his reputation then was chiefly that of a most skillful operator. His "copy" was marvellous; for two weeks after his departure every operator in the office was trying to imitate it.

It came about in this way. The "Sendemfast" Telegraph Company had just been organized on the basis of a new method of telegraphic transmission, which was greatly to increase the capacity of ordinary wires, besides dispensing with high-priced operators and substituting cheap boys and girls in their stead. That was what the public announcements said, but the all-night man had private assurance that, while the successful establishment of the Sendemfast system was going to carry great devastation into

the ranks of the plugs, it would really create an increased demand for strictly first-class operators, such as himself.

Being anxious to ascertain whether their system could be operated successfully on long wires, and having none of their own to experiment on, the Sendemfast Company obtained permission to use for experimental purposes, after business hours, one of the wires terminating in the all-night man's office. It is needless to say that that person was wide awake to all the proceedings.

The great difficulty, the electrician said, was to get rid of the inductive charge and discharge of chance relays in the circuit. The all-night man assured him that strict orders had been promulgated to have all relays cut out of that circuit. Nevertheless, on the first trial, when instead of Morse characters the receiving tape registered an irregular and continuous line, the electrician, after careful scouting, asserted that there were still four relays somewhere in the circuit. Then he shunted into it a little box of electro-magnets, one for each of the supposed relays, but wound the reverse way, in order to neutralize their inductive action. This had the effect of causing the irregularities on the receiving tape to assume a grotesque resemblance to Morse characters strung on a string, the string being the continuous streak before mentioned, which persisted undimmed.

Four nights of experimenting failed to change this result, and the disturbing streak was set down to the interference of earth currents and induction from parallel lines, for which there was no remedy at hand.

On the fifth night, when the electrician came in, his countenance was radiant. He had changed a part of his attire, and appeared in a navy-blue flannel shirt, with a striking turn-down collar, and a gorgeous anchor worked on the bosom. "I have got it now," he cried enthusiastically, "the best thing out!"

"You have found a remedy for the trouble?" suggested the all-night man.

"Remedy, no; but this shirt—look at it! Only cost a dollar and a half, and I don't have to ever get it washed!"

Years have glided by since then, leaving their gifts of joys and sorrows, and vanishing into eternity, and still the all-night man plods patiently on, fondly dreaming of the first-class daylight position that is to be his when the Sendemfast system shall have superseded and pushed to the wall the dear old Morse that we all know and love.

ALBERT FRESCO.

#### Notes and Queries on Electricity and Electro-Magnetism and their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

BY T. D. L.

Q. 105. What is the Gramme machine?

A. The Gramme machine may be regarded as forming a class by itself. It consists essentially of a ring of soft iron, covered with a great number of coils of insulated copper wire, the respective ends being all connected with the separate sections of two commutators fixed on the axis of the machines. The ring, with its coils and commutators arranged upon the axis, revolves between the poles of a permanent or electro-magnet.

This machine differs from all others, and has been extremely successful and to a great extent instrumental in establishing electric lighting on its present footing. Both this machine and the

Brush may be worked either from permanent or electro-magnets.

Q. 106. What is meant by the term "dynamo-electric machine," and in what does such a machine differ from a "magneto-electric machine?"

A. The term dynamo-electric has by common consent come to be exclusively applied to machines which I have placed in the third class described; namely, those in which the current is developed in the first place by the residual magnetism (which is never entirely absent from the iron core of an electro-magnet that has once been magnetized), and in which the current so developed is passed through the coils of the developing electro-magnet, thus increasing its magnetism, and, as a consequence of the increased magnetism, increasing also the current developed by it, the machine continually increasing its action, as it were, at compound interest, up to a certain point, where the work of bringing the armature past the poles becomes so difficult as to balance the driving power.

The term dynamo-electric is also occasionally made to include machines of the second class, such as Wilde's, and, strictly speaking, is applicable to any form of machine (including even those which develop frictional electricity) by which work is transformed into electricity. But so universal has become the custom of limiting the term to the machines described above, that it is now useless to attempt any change. The term magneto-electric is generally limited to those machines in which the electricity is induced by the magnetism of permanent magnets.

Q. 107. What is an induction coil, and why is it so called?

A. It is an instrument designed to obtain electricity of great electro-motive force from a battery of small electro-motive force. It consists of a short coil of comparatively thick insulated wire, around which is wound a very long coil of fine wire. In the centre of the coarse wire coil is placed a core of soft iron, or a bundle of soft iron wires. The coarse wire coil is placed in circuit with a battery and circuit breaker.

The induction coil was invented by Prof. Page, of Salem, in 1836; brought to a state of great perfection in the shop of Ruhmkorff, in 1851, and in 1857 much improved by Ritchie, of Boston. It is both a magneto-electric and an electro-magnetic apparatus, because the induced current which manifests itself at the terminals of the fine wire coil is formed by the conjunction of a magneto-electric current, caused by the rapid magnetization and demagnetization of the core as the voltaic current in the coarse wire coil is alternately made and interrupted, and of that excited in the fine wire coil by electro-dynamic induction from the coarse wire coil during the same contacts and interruptions.

To particularize: We have already seen (query 12) that when a closed circuit is in proximity to a conductor which is in connection with a voltaic battery, at the moment a current arises or ceases in that conductor another current of momentary duration arises also in the closed circuit near it. We have also seen that when a magnet is moved near a coil of wire or a coil of wire near a magnet a current is developed in the coil on the approach of the two, and another in an opposite direction as they are parted.

These facts are combined in the induction coil, and the coarse wire coil performs two duties at the same time, namely: 1st. That of advancing and retreating the inducing magnet, which it does most effectually by alternately causing the soft iron core in its interior to become magnetized and demagnetized. 2d. That of causing, by the make and break of its own circuit, momentary currents of electricity of rapidly alternating direction.

Thus we see that the voltaic induced currents are superadded to those induced by the core in its magnetization and demagnetization, to form the induced currents circulating in the fine wire coil.

The instrument is called "the induction coil" because the currents of the fine wire coil are produced solely from inductive causes; and the electro-motive force thus induced in a long coil is so enormously greater than that of its inducing battery as to assume an appearance very similar to that of frictional or mechanical electricity.

Q. 108. What is the "primary circuit" and

what is meant when we speak of a "primary current?"

A. The primary circuit or coil is the coil of comparatively coarse wire which is connected up with a battery and circuit breaker. Within it is inserted the soft iron core, and it is itself inserted within the coil of fine wire. It may also be called the "main," or "inducing circuit;" but the term "primary circuit" literally means "the first circuit."

It is called the primary coil because it is employed for the conveyance of the battery current. It will hereafter be understood that whenever the word "primary" is used with reference to induction coils, it is intended to signify the battery circuit. When we speak of the primary current we mean the battery current that traverses the primary coil. It is sometimes called the inducing current.

Q. 109. What is meant by the terms "secondary coil" and "secondary current?"

A. The secondary coil is the long coil of fine wire which surrounds the primary coil, and in which the momentary currents, induced by the primary coil and core, are developed.

As the induced currents are much more powerful than the primary currents, it is necessary to be much more careful in insulating the wire composing the coil.

The wire of the secondary coil is much longer and finer than that of the primary. It is called the secondary coil, both in contradistinction to the primary coil and because the currents set up in it are dependent entirely for their existence on the first, or primary current, which circulates in the primary coil and excites magnetism in the core.

The secondary or induced current is the current or, more properly, the series of currents which are excited in the secondary coil by the rapid magnetization and demagnetization of the soft iron core in conjunction with and caused by the make and break of the primary circuit. This current has a much higher electro-motive force than the battery or primary current.

Q. 110. In speaking of induction coils, what is meant by the extra current?

A. It is the name given to a current set up in the primary coil by induction between the several convolutions of the same wire when a current is sent through it. It is produced both on making and interrupting the battery contact; but is much stronger when the circuit is broken, because then the extra current is in the same direction as the primary currents, but when the circuit is made the extra current is in opposition to the primary current, which, as it were, arouses an opponent in its own path. Thus we see that the action of the primary coil in addition to inducing a current in the secondary coil also induces a current itself. This current is made apparent in the following manner: If we attach the two coils of a wire to a battery, and place a contact breaker in circuit, a very fine spark will be observed on breaking contact.

But if we wind the piece of wire into a helix or spiral, we will at once notice that the spark is much larger and brighter. This is caused by the action of the extra current which, as previously stated, is on breaking contact in the same direction as the battery current, and the spark is the combined effect of the two currents.

The extra current caused when contact is made is called the "inverse current;" when caused by breaking contact it is called the "direct current." The phenomena caused by the extra current were first noticed by Henry in 1832. It was subjected in 1834 to experiment by Faraday, who proved that both the spark and shock given on breaking contact were due to this cause.

Q. 111. Why is a soft iron core inserted within the primary coil?

A. Because, in the first place, without it the current produced in the secondary coil would be caused solely by dynamic induction from the battery current circulating in the primary coil, and in that case would be comparatively weak; while when the core is inserted, it is alternately magnetized and demagnetized by the rapid make and break of the battery circuit, and so induces a magneto-electric secondary current, which adds its effect to that of the current caused by the voltaic or dynamic induction, and makes the combined effect very strong and intense. In the second place, the soft iron core is often utilized as an electro-magnet, and in that capacity is

made to attract the contact breaker; thus effecting by its own magnetism the rapid interruptions of the battery current.

As it is important for the proper operation of an induction coil that the core shall gain and lose its magnetism very quickly, it is usually composed of a great number of unpolished soft iron wires, which are partly insulated one from another by a thin coating of oxide. The circulation of induced currents is thus prevented.

#### Proposed Railroad Telegraphers' Society.

At a meeting of railroad telegraphers held in Jersey City, N. J., on Sunday, March 13, for the purpose of discussing the feasibility of organizing a Railroad Telegraphers' Benefit Society, it was decided to issue an address asking for the views of railroad telegraphers in general, and inviting suggestions and opinions on the subject.

The desire for a benevolent and insurance association among railroad telegraphers has long been felt, and there is no doubt that, properly organized and wisely conducted, an association of this kind could, in a few months, be so enlarged and extended as to embrace nearly every railroad telegrapher in the country, thereby proving a complete success.

Various opinions were advanced at the meeting referred to, regarding the object of the proposed association. Some were in favor of making it a mutual benefit society, with monthly dues for the creation of a sick fund and an assessment for each death, while others were in favor of the death assessment only, with no sick fund, and there were still others who favored the adoption of both plans.

There were those who believed that the proposed society should be something more than a benevolent one; that its members should combine to advance and protect their interests in every way; that as a class they abhor any society or combination of men that savors of trades unions; that they should combine their efforts to build up a society looking toward a more fraternal feeling among themselves, and to establish and maintain a position of industrial independence by recognizing the law of supply and demand as it applies to the telegraph business.

Some were strongly in favor of making the society strictly "railroad" in its character; that is to say, admitting to membership none but those actually employed on railroads, while others thought that it would be well to admit commercial operators and those engaged in other branches of the telegraph service.

It was unanimously decided to issue this call. All railroad telegraphers who are in favor of a society such as the one proposed are earnestly requested to forward an expression of their views, the same to be read at the next meeting, due notice of which will be given through THE OPERATOR.

The meeting resolved itself into a committee, and appointed Mr. Geo. E. Holbrook, Secretary *pro tem.*, to receive all communications. Mr. Holbrook's address is corner Tenth and Provost streets, Jersey City, N. J.

THE inventors of the various electric lights have invented a new theme to wrangle over, viz.: Will the electric light tan a fair skin? The vendors of the voltaic arc light boldly assert that ladies will have to erect parasols whenever the incandescent principle is in use, while the peddlers of the incandescent light say that the voltaic arc principle will develop a face like a boiled lobster upon any miserable being who remains long beneath its effulgence. The question is still unsettled.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, APRIL 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

## NOTICE.

A branch office of *THE OPERATOR* has been established at Nos. 84 and 86 La Salle street, Chicago (Room 9), half a block from the Western Union general office. Mr. J. H. Green, the manager, has a full supply of our several publications on hand, and will fill all orders for the paper or books at the same rate at which they can be had from New York. The telegraphers of Chicago, and those visiting that city, are cordially invited to call at the new office. Our general agent, Mr. J. R. Calder, will visit Milwaukee during the present week, and expects to leave Chicago on Monday, April 18, for St. Louis and Kansas City, calling at Bloomington, Alton and other cities on the way, for the purpose both of securing subscriptions and appointing agents.

## THE TELEPHONE.

The national gathering of telephone men, at Chicago, on the 5th inst., emphasizes better than anything else the rapid and prodigious growth of that very recent invention. At their previous meeting, held at Niagara Falls, September 7-10, 1880, there was represented \$10,000,000 of stock; which, after an interval of only seven months, now represents something like \$17,950,000 of stock, all of which is unpurchasable. Indeed, among all the wonders of the age, there is nothing more wonderful than the invention and progress of the telephone, made practicable only five years ago—Prof. Bell claims that the date of the invention of his method of articulate speech was Jan. 15, 1876. It is already found in use in all parts of the world, as popular and useful in Egypt, New Zealand and China, as in America and Europe. This year alone the English post-office authorities have given orders for 20,000 telephones, while its rapid spread in this country is almost beyond calculation. It is introduced with equal eagerness for commercial and domestic uses; it is fast driving out the old fire-alarm telegraphs, while for purely scientific purposes—such as detecting faults in ocean cables without resorting to the old and expensive process of cutting and splicing them—its availability seems beyond calculation.

Much of this is due to the restless energy and genius of its inventor and promoters, for the telephone has drawn to its assistance some of our most profound scientists and brightest business men. It has, in return, brought them in one short lustrum wider fame and ample fortune; the latter statement being best illustrated by an incident which recently occurred in England. At a meeting of the United Telephone Co., last autumn, the discussion developed the remarkable fact that two men who had paid

\$3,500 for their privilege of acting as the company's agents for the sale of telephones had refused \$150,000 offered by the company to cancel that engagement.

As will be seen from the item in the Telephone Department in the present issue, the number of exchanges in operation in this country has increased in one year from 138 to 408, and the number of instruments in use from 60,873 to 132,692, so that in the United States only one city having a population of over 15,000 is now without a telephone exchange. Other items in the same department show how the introduction of the telephone is being extended abroad as well as at home.

But the uses of the telephone must still be widely extended. Rapid strides are already being made in long distance telephoning, speech having been recently transmitted from Tours to Brest, a distance of over 800 miles, with a single Leclanché element, the experiment being witnessed by Prime Minister Jules Ferry and other dignitaries. These experiments must be pushed further, for the application of the telephone to long distances has become a necessity, and its use must not stop with the shore. It must be applied to ocean cables, and made audible during the noise of military operations, and even above the roar of battle. Connecting the most remote corners of the earth, like the telegraph, it must rise superior to that invention, and bring them virtually within *speaking* distance.

We have taught ourselves to believe that there is no such word as fail, and with so many men of genius at work perfecting the details of this new agent of intercommunication; with so much capital eager to back their enterprise; and with so much organizing talent and executive ability as is displayed to-day in the telephone business, the great invention of Alexander Graham Bell is springing forward to success unparalleled in the history of scientific discovery.

The sweeping changes in the *personnel* of telegraphic officials, which seem to have just commenced, have their lessons for all to read and learn. Many a broken-spirited operator, here and there throughout the country, will view with grim satisfaction the unceremonious sweeping away of some bragging, bellowing and worthless parvenu official, who for years has elbowed his way through the world, in total disregard of the rights of others. The lesson is a wholesome one. To be finally enslaved in the net in which you have enslaved others is the natural, and nearly certain, punishment of insincerity and tyranny. It is a bitter penalty, and the culprit is not altogether without our sympathy, but it is eminently proper that it should turn out just so, and that the base, the hollow and the untrue should endure the suffering which they have themselves inflicted upon others. The coming generation of telegraphers may profit by the lesson. If, however, the lesson stopped here we might point the moral, but it has gone further. There have been some dismissals, apparently without cause, of men who have seen from 30 to 35 years' hard service. Here is an old man, incapacitated by prejudice, inclination and his long daily drill from any other kind of work, suddenly thrust upon the world to commence life over again; and, as far as we can see, without cause. Growing boys have been emulating that man's actions, in the hope of being as well rewarded in their old days as they thought he was. His whole life has been transparent to every one. He never sawed a pole in all his born days; his word has been reliable;

his attendance constant, year in and year out; his work excellent, until, perhaps, the past year or two, when the tell-tale trembling pen showed that his grip was not quite so firm as it used to be; his general character has been sturdy, firm and entirely trustworthy. So the old fellow has lived on in peaceful anticipation of being able to provide to the end for the stern necessities of food for the little ones and rent and clothing, so long as he approximated that standard. He has expected no unusual severity, because he could not be guilty of it himself; he feared no extraordinary crucial test of his fading glories, because he deserved none. Having sown the seed in fruitful ground, he looked forward only to the golden harvest; and, having cut the grain, he sees another hand stretched forth to bind and carry off the sheaves. When hard work has quenched the natural brilliancy of his mind, when the old fingers cramp with a little less work than they used to do, and his good old head has become white in the service, it is hard for him to be compelled upon short notice to leave the scenes which, by 25 or 30 years association, he has regarded as consecrated to himself. Prosperity should be made something more than a dream to our youth, if we would have good workers; but where is the hopeful lesson for them in the spectacle of the old man tottering home to tell his aged life companion—the grieving wife—that his years of life have exceeded his years of efficiency? What encouragement is there in this for the youthful, gifted and ambitious tyro? This is a question which should be best answered by those who have the benefit of the service nearest at heart, and who have staked their reputations upon purifying, elevating and systematizing it, for the ultimate good of all.

TELEGRAPHERS have long since regarded their business as a profession, and it is a question now if it is not high time for us to draw together as such, and by forming a little "consolidation" of our own, recognize our own importance as a corporate body, and develop some of the self-assertion which seems to be inherent in every corporation. The greatest evil which has assailed us thus far is the large increase of late years in the number of telegraphic "colleges," not to mention the vast number of private "students" taught for a few dollars a head, principally by railroaders and men who are themselves generally a disgrace to our profession. In this way young boys who have been taught to consider it disgraceful to work, and who are too ignorant or too stupid to attempt something higher, take up telegraphing as a "genteel" occupation, and are encouraged by poorly paid operators, who "teach" them for the small fee which they receive in return. To lower the standard of ability and intelligence in a profession is to lower the respect which every intelligent person must feel for it, and it is certainly not going too far to insist that a censorship be exercised over the enlistment of apprentices, to the extent at least that they must be possessed of a fair education and a moral character. This is a subject which more than anything else concerns our salaries, as well as our own respect for the occupation of a telegrapher; and, we doubt not that if the matter be gravely considered, we shall find, in view of recent developments, that the time is ripe for a simultaneous, concerted movement of all the operators in the country to form an organization which, without the aid of grip-signals and dark-lanternism generally, will purify the profession, and lift it above the level of the common store-clerk.

A step in this direction has already been taken by the railroad operators employed in Jersey City, and they have our hearty sympathy in their efforts.

THE exploded story that some absurd old Pennsylvanian, Daniel Drawbaugh by name, invented the telephone in 1867, is again going the rounds of the press. It is not long since the *Pekin Gazette* claimed that the telephone was known in China in the year 968, having been invented by King Foo Whing, a distinguished philosopher who flourished about that time. It was also, the gossips say, described by Robert Hooke, F. R. S., 214 years ago; and, now, forsooth, we must place the laurels upon the head of this ancient president of Milltown, Pennsylvania. The telephone is persecuted enough, and ought now to be given a chance; for it cannot, like the phonograph, talk back. The Germans tried to kill it with the name of "Doppelstahlblechzungen-sprecher," but it finally came out triumphantly as a "Farnsprecher," and we have no doubt but that it will survive the present attack. As a matter of fact, the telephone is so ridiculously simple that we wonder why it was not discovered centuries ago. It reminds us of Dickens' jail-bird who spent 20 years or so in his dungeon, pining for freedom, and who one day raised the window, which had been unfastened all the time, and stepped out a free man. But, whoever may have *dreamt* of the telephone in years past, let us give the credit of perfecting it where the credit belongs—to Alexander Graham Bell.

IN reference to our statement that the lumbering telegraphic character ————— (ch) is used on the English Morse wires, an English reader of THE OPERATOR writes all the way from London to say: "I have \$50, which, being endowed with speech, says that no such signal is in use in the Postal Telegraph service here, if any corresponding \$50 can be found to say different." We know that the barbarous signal was in use there in 1870, so that it must have been dropped since then; which only goes to prove that in England it takes at least a quarter of a century to discover the utter uselessness of such monstrosities in the telegraphic code. But if our esteemed and wealthy English correspondent wants to stick to the main point; if he has not yet parted company with his remarkable fifty-dollar bill, and if it be still endowed with a similar degree of eloquence, let it assert that a picked team of American operators cannot get through with ten thousand words or so of press matter quicker than an equal number of picked Englishmen, each side using its own code signals. Now, that is a remark which would develop an astonishing amount of fiscal loquacity in every fifty-dollar bill in the Western hemisphere.

OUR cordial thanks are due to Manager Maynard, Col. Wilson, Supr. Tubbs and Messrs C. H. Summers, C. Wilson, A. L. Baker, W. L. Cullen, J. A. Wurzburg, P. A. Rowe, and others, as well as the various chiefs in Chicago, for their kind attentions during our recent visit to their city. No one can say that he has seen a complete, first-class telegraph office who has not closely inspected the admirable inside working of the Western Union general office at Chicago during the day time. The working in every department is excellence itself; and, indeed, we cannot see how it could be otherwise under the guidance

of such a body of courteous and competent officials, and such a well-trained and intellectual corps of operators and clerks. We have no doubt that a similar indorsement might be given to the night force; although, we are sorry to say, the want of cordiality on the part of the person in charge—no doubt, temporarily—toward the representatives of this paper, prevents us from saying so from personal knowledge.

SOME of the men now being squeezed out of the Western Union service are old telegraphic warriors who helped to build it up. They may now transfer their undoubted abilities to the independent companies, actual and prospective; and if these young concerns, conforming to the prevalent fashion, should assume a consolidated form, there may yet be lively times ahead. History is constantly repeating itself. "Reform" is a very fair phrase now, and you can roll it glibly under your tongue, as you show the feeble, gripless old man out of the door. But, as we all go whirling down the ringing grooves of change new transformations occur, and we may once again hear the subtle word "Reform," while the rehabilitated victim says, with a profound bow, "I thank thee, Jew, for teaching me that word."

IN communicating to our government the decree which the French government have passed convoking an international congress of electricians to be held in Paris on the 15th of September, 1881, Mr. George Walker, our Consul General in Paris, echoes the sentiment of every American telegrapher when he says: "I may be permitted to express the hope that the country which gave birth to Franklin, to Morse, and to Henry, and which is now the home of Gray, of Edison, and of Bell, will not neglect to participate in the proposed congress of electricians, and to impress upon it those scientific ideas in relation to one of the greatest forces which modern discovery has furnished to the world, which have received such a remarkable and rapid development in our own country."

IN commenting, in our last issue, upon the summary discharge of so many old telegraphers, we, very naturally, expressed the liveliest sympathy with the man who, having literally "hewn his way through the world," now finds the hands of time set back at least 25 years. There can be no better example of the keen appreciation in our profession of genuine humor of a slightly satirical turn, than is evinced in the questions since addressed to us by several irreverent correspondents asking why, for a better understanding of the fine point, and in view of the recent pole-cutting war, we did not use quotation marks in connection with that highly suggestive sentence—"hewn" his way.

MILLIONAIRE telegraph operators are now met with frequently enough not to excite any special comment, but when we hear of such a one continually doing something to make his fellow-men happy, we take much pride in inscribing his name beside the names of Asa Packer, Ezra Cornell, Peter Cooper, Matthew Vassar and Johns Hopkins. The gift by Andrew Carnegie of a free library to his employes recalls the fact that it is only a short time since he donated \$25,000 for a free library in his native town, Dunfermline, Scotland, and that thirty years ago (1850) little Andrew Carnegie was carrying messages. Later on he was operator at Altoona, Pa., and gradually worked his way to fame and fortune.

CORRESPONDENTS who write to us for information and neglect to give their full name and address, must not be disappointed if we take no notice of their requests. We are always willing to go to considerable trouble to oblige a subscriber, if the information he desires be of sufficient general interest; but we ought, at least, to know who our correspondent is. The same rule applies to items sent for publication. We often receive communications which we should be glad to publish, were it not that the writer has neglected to give his name and address, thus leaving us in doubt as to the trustworthiness of the information he sends.

SINCE Commissioner Fink sat down so heavily upon the wild statements made by Judge Black and Secretary Windom in their ill-advised and hasty effort to catch the popular breeze by leading an anti-monopoly crusade, the Secretary has been exceedingly quiet. He may not have changed his views—we suppose he considered them views—upon the question, but they haven't been quite so luminous of late. His Department, however, takes its revenge, in a measure, with the wicked monopoly by declaring that the rates paid by the government for telegraphing shall be greatly reduced to certain points.

COMING events are certainly casting their shadows before, when we find the electric light companies already competing with the gas companies for the contract to light this city. The bids for lighting the city for May 1 were opened last week, when for the first time an electric light company entered the lists against the gas companies as a bidder on a large scale. The new mayor of Philadelphia, in his inaugural address, speaks highly of the electric light for street illumination, and commends it to the favorable consideration of Councils.

WHAT changes have taken place in the telegraphic world since the death of William Orton, only three years ago. The third anniversary of his death will occur next Friday, the 22d inst. We should not pass over the solemn occasion without recalling the words of Mr. J. D. Reid, in honor of the man who "by his integrity, skill, patriotism and prudence made the telegraph in America the synonym of honor, enterprise and success."

WE expect to be able to publish in the next issue of THE OPERATOR detailed descriptions, with illustrations, of the Chicago police telephone and patrol system; the Haskin's telephone system of Milwaukee and the various manufacturers' exhibits at the recent telephone convention. These articles will be of much interest and value to all readers of THE OPERATOR, but especially so to our telephone brethren.

THE Atlantic cable is rapidly coming into use for the transmission of diagrams and charts. The *Herald's* targets showing the exact position of shots made in international matches across the sea have appeared more than once; but it has been reserved for the enterprising *Graphic* to telegraph the basis for an accurate picture. That journal recently published a "telegraphic picture" of the scene of the murder of the Czar.

IF any one wants to study the proper way to fight a monopoly he may find much food for thought in the lively manner in which the new Mutual District Messenger Co., in this city, is waking up the sleepy old American District.

### The System of the Union Electric Railroad Signal Company—Examination of the System by Railroad Men and Electricians.

By invitation of Mr. J. Gardner Sanderson, General Manager of the Union Electric Signal Company, a party of railroad officials, capitalists and electricians, on Wednesday, March 16, inspected the systems of signals in operation on the line of the Fitchburg Railroad, between Belmont and Waltham, Mass., and examined the Signal Company's overlapping block signaling system, the interlocking of switches with special signals, and the several forms of highway crossing signal bells.

By the courtesy of Superintendent Adams, of the Fitchburg Railroad, a special train conveyed the party to Waltham, leaving Boston at 11:30 A. M. There were present: Mr. George Westinghouse, Jr., President of the Union Electric Signal Company; Mr. George H. Christy, Patent Solicitor and Counsel, of Pittsburgh, Pa.; Mr. Ralph Bagaley, of Pittsburgh; Mr. J. Chester Wilson, Electrician of the Pennsylvania Railroad, Altoona, Pa.; Superintendent Folsom, of the Boston & Providence Railroad; Assistant Superintendent French, of the Old Colony Railroad; Frank L. Pope, of New York, Director of the Union Electric Signal Company; Superintendent Adams, of the Fitchburg Railroad Company; J. Malcom Forbes, of Boston; W. H. Forbes, President American Bell Telephone Company, Boston; Mr. Henry Snyder, Pittsburgh; T. D. Lockwood, Electrician, Boston; Messrs. Edward Cunningham, C. H. Jackson, D. A. Holmes, John H. Sturgis; J. B. Ecclesine, Jr., of the *Railway World*; J. Otis Wetherbee; A. Blodgett, of the Boston & Albany Railroad; D. C. Knowlton, John Hitchcock, Oscar Gassett, and several representatives of the Boston press.

The first stop was made at Somerville, where an examination of the system as it has been in use since April, 1879, was made. Mr. Gassett, superintendent of the company, here clearly explained the working of the system. The track is divided into sections of a mile, more or less, with one cell of battery at one end and a signal at the other—one pole of the battery is led to one rail and the other pole to the other rail. The signal is also similarly connected, one wire to one rail and one wire to the other. The rails are not insulated in any way, except at the ends of the sections; one section is insulated from the next.

The signals are placed about 200 feet within the section, so that when a train enters the section the engine man can see if the signal operates properly. The battery current operates through a coarse wire magnet to hold the signal for safety. When an engine enters the section, a shorter path is provided across the metal of the engine and the signal magnet is demagnetized. The signal, by an ingenious escapement arrangement, then turns to danger. The signals show full face when set for safety, and are turned round edgewise for danger. The facts were rapidly detailed during the brief stay at Somerville, after which the trip was resumed to Waltham, where the signals are newer. The signals here protect the trains until after they have passed a point 1,200 feet beyond the next block signal.

Here Mr. Gassett explained the interlocking switch. It is impossible to turn this switch when a train is approaching, as a magnet inclosed in the switch box becomes demagnetized when a train is on the section and permits its armature lever to drop into a slot on the switch shaft, and there locks it. Two of these switches were shown at Waltham, with their method of operation. If it is absolutely necessary that these switches should be turned, means are provided whereby they may be, by moving certain levers in locked boxes. The highway-crossing signal bells were also inspected. Close attention was given to Mr. Gassett as he explained the various devices and much interest was manifested by the gentlemen present.

At the conclusion of the inspection a neat and tasty lunch was served on the train, after partaking of which the party returned to Boston. A hasty examination was then made of the company's factory at No 82 Canal street, where the nucleus of an extensive business may be seen. The principal patents owned by this company are those of Robinson, Pope and Gassett.

T. D. L.

### New York Electrical Society.

At the regular semi-monthly meeting of the above society, in the Chemical Lecture Room of the Cooper Union, on Thursday evening, April 7, Geo. B. Scott, Superintendent of the Gold and Stock Telegraph Company, lectured on "Electrical Measurements with the Wheatstone Bridge."

The lecturer first constructed a galvanometer with some common sewing needles, which he magnetized by placing for an instant across the poles of an electro-magnet, a piece of cork, in which the needles were placed; a thread of silk, a broom straw, some sealing wax and a piece of magnet wire.

With these materials a very sensitive instrument was put together which the lecturer used in his subsequent experiment. On a large wooden frame the connections of the bridge were run, and the methods of measuring resistances when placed in one side of the bridge practically illustrated. To show how sensitive the galvanometer was to slight changes in the resistance of the connecting wires, Mr. Scott held a lighted taper to one of the wires until a section of less than an inch in length was heated, when the needle of the galvanometer was strongly deflected.

At the conclusion of the lecture, President Jones and Prof. P. H. Vander Weyde gave some interesting information on the subject before the meeting. After a vote of thanks to the lecturer of the evening, the society adjourned.

Eighteen new members were elected. The total membership is now 240.

### The Development of the Telegraph Pole.

It is somewhat strange that people who have a passionate regard for whatever grows rapidly and large do not occasionally steal a moment from the great West and the big elephant, the street-cleaning swindle and the cheek of the ticket speculator, and contemplate the telegraph pole of the period. A quarter of a million people can remember the time when telegraph poles in this city did not overtop second-story windows and were small enough for a single man to lift; but they have gained altitude and rotundity so fast that from some that now are going up two or three respectable saw-logs could be cut and still leave enough to start a kindling-wood factory in business. The size may seem at last to have found its limit through the inability of our Eastern forests to grow taller trees, but the companies still have the giant redwoods of California to fall back upon, or they can put up poles in two or three sections, like the masts of ships. There was a time when the poles were seen in only a few streets, but now they are as widespread, numerous and ornamental as unemptied ash barrels. Once the tiniest child playing "peep-bo" could not find a pole big enough to hide it, but now the footpad who cannot conceal himself behind any specimen of the new crop of telegraph poles has grown stout enough to earn an honest living by joining a museum in the capacity of the modern Daniel Lambert. If, however, the size of the poles is to increase as rapidly as it has heretofore done, the biggest trees will soon be too small; the companies should therefore begin to consider the propriety of replacing poles by towers, of the lighthouse pattern, with rooms to let inside. The public would not object; people who allow a city to be disfigured by thousands of great logs on end are spiritless enough to stand anything.—*N. Y. Herald.*

### From the Pacific Coast.

To the Editor of The Operator:

SIR: All quiet along the Pacific! We have heard of the untimely end of the American Union (which, for the benefit of readers over the sea—or half seas over—we will explain, does not mean the American nation), and, although our grief is just precisely as deep as it should be, yet we are not entirely inconsolable, for it is a species of sorrow which has come upon us before, and consequently we were not entirely unprepared for the "dire misfortune of its taking off." (Forgive me, immortal William, but,

really, your way of expressing it is just a little bit too strong for the occasion!)

'Tis true that we had a considerable stock of hope invested in this promising infant, whose youthful vigor and lusty strength at a very tender age appeared to indicate that he would make things lively for a certain conglomeration of "bloated bondholders," who were not conducting themselves in a manner that commanded our respect, or that was calculated to arouse our loyalty to a state of fervent enthusiasm; but a little reflection had brought to our mind the axiom that "the good die young," and so, when the American Union ceased to be, our stock of hope merely went down about a hundred per cent., and, as we had been buying on a margin through our broker, Fate, we found ourselves bankrupt—but only for the time being!

Short lived, as it unfortunately was, the American Union probably accomplished some good. It gave employment to a great many operators, and it showed the Western Union Telegraph Company two things: "First, that the people are not only willing, but eager to give their support to an opposition company; and second, that the Western Union Company does not possess the undivided loyalty and respect of one of its employes out of a hundred! The Western Union has been deserted by many of its best men in the hour of need, and until the policy of that company undergoes a radical change it need never expect to be able to depend thoroughly upon the men upon whom it really is dependent for perfect success.

Telegraph operators are not a particularly unreasonable lot of human beings, and when, almost without exception, they express dissatisfaction at the narrow-minded, illiberal and short-sighted policy of the corporation which employs them, it may safely be taken for granted that there exists a cause, in fact innumerable causes.

The immaculate "Board of Directors," who sit in the city of Gotham and issue their edicts, from which there is no appeal; whose sole idea of a wise financial policy is exhibited in schemes for the reduction of expenses, and who evolve periodically from their gigantic intellects such ingenious "rules and regulations" as delight the heart of him who loveth "red tape," and make miserable the unhappy manager of a cross-roads office, whose monthly receipts of a dollar and a half, or thereabouts, have to be spread out all over the surface of 92 blanks, or less—these all-powerful individuals seem to labor under a delusion that the average telegraph operator is an aspiring, ambitious, revolutionary, socialistic and communistic individual, who must be kept down beneath the iron heel of power, or he will eventually rise up and swallow the potential magnates whom nature created to rule over him!

This is a mistake, gentlemen, 'tis true we have a lean and hungry look, but just increase our salaries about 20 per cent., and see how fat, contented, and consequently happy and harmless we will become!

Here, upon the Pacific Coast, are two great corporations working side by side—the Western Union Telegraph Company and Wells Fargo Express Company. The employes of both companies are men of equal intelligence; in many cases the positions of telegraph operator and express agent are filled by the same individual. In the case of the first-mentioned corporation there is no sympathy at all between employer and employes, and no bond of union, except the mere question of dollars and cents. The employes of the telegraph company universally express discontent and disgust at the policy pursued by the corporation employing them; the employes of the express company are, with, possibly a few exceptions, loud in their praises of their employers, and the liberality which characterizes the whole policy of the corporation for which they work. This marked con-

trast is the direct result of some cause, and not because one set of men are unreasonable and naturally discontented and rebellious, while the others are just the reverse. A few of the points of difference between the management of the two companies may profitably be noted: First. The employé of the express company is reasonably certain that as long as he performs his duty to his employer he will not be dismissed upon the mere recommendation of a subordinate official and without cause. Second, he is morally sure that in the event of a vacancy which shall afford an opportunity for his promotion, his claims will be considered first in preference to those of some well recommended individual from the other side of the continent, for true civil service reform must, like charity, begin at home. Third, should he be injured in the performance of his duty, he will be cared for by those in whose service the injury was received, and if in any emergency he does more for his employer than the strict terms of the unwritten contract require him to do, he knows that his conduct will be appreciated. Fourth, if he has charge of an agency and orders from the supply department a box of pens, that quantity is sent to him promptly, instead of his receiving a half dozen of the company's "best," with a note to the effect that the business of his office will not warrant a more liberal supply during the present depressed condition of the company's finances! Fifth—but it is useless to multiply the points of contrast. It can readily be seen that one company bases its hopes of success upon and regulates its conduct by certain innumerable and inflexible rules which do not admit of the idea that it is possible for its operators to do anything right unless they are compelled to do so, and only considers it necessary to wind them up with a salary at regular intervals; while the officials of the other company bear in mind the fact that its agents, being men, must be dealt with in a manly manner, and that a considerate and generous policy, financially and otherwise, is the only one that possesses the necessary requisites of permanent success.

There has been some new life infused into the management of the Western Union. Officials who have been out of it for a few years have returned to it again, and as they are men possessing a reputation for liberality, which it would be base flattery to accuse the old board of managers of possessing, we have some hope that we shall soon experience some tangible symptoms of reform. The company here and elsewhere has a few minor officials who are naturally disposed to do justice to the employés under them, having risen from the ranks themselves; but they are tied down by that all-potent and infallible "Executive Committee," and possibly some superintendents of divisions, so that they are practically powerless.

Well, we shall live in hopes that salaries which were reduced by that "sliding scale" will be raised to the old figures, and that the reductions which have been systematically made upon the Pacific Coast since that time will be succeeded by a general increase of wages, and we assure the "Executive Committee" that the experiment will pay. Still we are not willing to wager a very large amount that the said committee is experimentally inclined. But we shall see what we shall see, and when that increase of salaries does come, we promise to bear it with becoming fortitude.

PACIFICUS.

FEB. 22, 1881.

### Reasonable Hours of Labor Tend to Subserve Corporate Interests.

To the Editor of The Operator:

SIR: The American District Telegraph Company have at last begun to realize that, in the long run, the only safe and judicious course to pursue in their relations with their messengers is to treat them with fair play and justice.

They appear to have awakened to this fact. Whether they deserve any credit for the awakening or not is hardly worth discussing. The many exposures in the past may have had something to do with it, and perhaps the appearance of a rival, in the shape of the Mutual District, may have had a little something more. However this may be, the fact is patent to the most casual observer. There is an improvement for the better. There seems to be a tendency, and an effort made to secure good service, by the only proper

and legitimate means that should be used for that purpose; namely, reasonable compensation, reasonable hours of duty, and a system of discipline, intended to weed out the worst elements with the least possible delay.

That this scheme will be eventually successful, depends very largely on the character and capacity of the men in charge of the offices. Any one walking into a district office, and taking a cursory glance around would be apt to arrive at the conclusion that it requires but a low order of talent to take hold and run the concern.

It does appear at first sight to be a simple matter; but it is not. A fundamental rule is that he who is not capable of governing himself is not competent to act as a guide to others, and this applies with double force to a district manager.

He must not only be able to keep his own temper under subjection, but he must be also capable of maintaining order and obedience by a strict and impartial meting out of justice in the almost innumerable cases that are constantly arising. Even if this were the only duty required of him, his task would be by no means an easy one.

He is, however, expected to answer police, fire and burglar alarm calls. Oftentimes the former calls are sent in either through ignorance or a spirit of malicious raillery on the part of the subscriber. Then he receives orders for coal, orders for theatre and opera tickets, which must be procured by telegraph from the executive offices, and the blanks filled up while the customer waits. The telephone also takes up some of his attention and time. Orders received for the district express likewise require looking after.

Then, again, there are complaints of all kinds from subscribers whose calls are not promptly answered; when they are answered and the service is not satisfactorily performed; when the messengers do not follow the instructions given, and when they sometimes, in a fit of absent mindedness, forget to deliver valuables intrusted to them.

The victims find a suitable target for their wrath in the district manager. The trouble does not end here, however. The Western Union delivery is a prolific source of agony for the district manager. There must not be any delays; there must be no failure to deliver the messages to the proper parties; there must be no sharp practice in connection with the collections; in fact, through the stupidity of some messengers and the carelessness of others, this branch of the service by no means tends to lessen the district manager's cares.

Even if *this* were all, his position would not be an enviable one. While he is trying to keep on good terms with the public, and avoid complaints as far as lies in his power, or to offer some kind of explanation for those that are unavoidable, he finds it necessary to keep a sharp lookout that he doesn't come in conflict with his superior officers. This requires long experience, no small amount of tact, and no end of dodging.

The inspector's instructions must be carried out; the solicitor must be soothed and listened to; the superintendent of the messengers demands attention; the assistant superintendent calls for respect, and the general superintendent must be obeyed.

By a wise provision and prudent forethought the district manager, if he is a conscientious, sober, and capable man (and there are many of them just such), finds it possible to attend to all these multifarious duties and cares during the period of twelve hours that he is allowed to remain on duty.

He reports at 8 A. M. and is relieved at 8 P. M., his relief filling in the other twelve hours. He doesn't require any recreation, hasn't got any home, no family ties, nothing, in fact, except an insatiable desire to be constantly in the harness—to be always on duty.

It would be an experiment well worth trying, and one that would unquestionably show good results in a short time, for the company to curtail the hours of labor. It must be understood that there is no lunch hour, half-hour or any relief whatever until the day is done.

The little additional expense necessary to effect the change would be trifling in the extreme in comparison with the added interest each man would feel bound to take in his work, to the increased advantage of the company. Something

ought to be done in this direction, and it is to be hoped that it will be done at no late date.

TOM TANGLE.

NEW YORK, April 8, 1881.

### Chicago Notes.

To the Editor of The Operator:

SIR: The new order of things in this city resulting from the consolidation will soon be fixedly settled. The transfer of wires, material, operators, managers, etc., is about over. The manager's office, adjoining the operating room of the W. U., has been closed out and the partitions torn down, connecting it with the operating room. The additional space is to hold the metropolitan or city line wires. The manager's office is now upon the next floor below.

Western Union resignations.—Col. J. J. S. Wilson, Supt.; C. Wilson, Assistant Electrician; E. D. L. Sweet, Manager Board of Trade, and Col. Lynch, Supt. Supply Department.

Installments to fill above places.—F. H. Tubbs (late of A. U.), Supt.; Mr. Vigus (late of A. U.), Manager Board of Trade lines, and Steve Robinson, Assistant Manager, do do.

Transferred from A. & P.—Messrs. Robb, Dyer, Spencer, Miner, Wilby, Derrickson and Mrs. Prescott.

Messrs. John O'Brien, Everham and Dorval have been changed from day to night force. Mr. Frank Brown, late of Western Union, this city, recently died of consumption, at his mother's residence in Walkworth, Ohio. His demise was surprisingly sudden. He was with us, apparently not in an alarming condition, only a few days before news reached us of his death. His old associates here extend sympathy to his relatives.

The new régime at this point is in some respects distinguishing itself in a most able-bodied manner. Among other late and notable hits may be incidentally mentioned these: One of our best and most reliable operators, while receiving overland messages from Omaha, accidentally received a duplicated number (an error of the Omaha operator) which escaped his notice. For this he was called before supreme authority and suspended ten days, and was informed at the same time that the punishment was considered light in comparison with the gravity of the offense. Another equally reliable man has been suspended for ten days for duplicating a number in sending. It has been given out officially, that "the duplication of numbers must be stopped, although every operator in the office should be discharged." The work will doubtless go bravely on. It is to be hoped, however, that the management will not, as is sometimes the case, draw any lines of distinction. If these actions are to be continued there is not a man in the office who would, if found delinquent, feel at all grateful for any special favor or exemption.

Your correspondent does not feel called upon to report by whose particular inspiration these movements are instituted. He simply records the facts as being, perhaps, of interest to those of the fraternity outside of Chicago's sacred precincts—particularly among those who are in daily or nightly communication with our office. There has been considerable feeling manifested in these cases among operators, as also among lesser officials; and some of the comments, you may believe, have been of a nature neither moderate nor flattering. It is, of course, not to be supposed that these attentions on the part of the authorities will be accepted very gracefully, as rewards of merit. Rewards of merit are evidently not in order at the present time. The purpose seems only to move with overwhelming severity in efforts to make every operator an infallible machine that may not err under any conditions whatever. An impossible undertaking certainly; yet, anticipated results seem to have justified the attempt in the minds of the executives, and we therefore await with painful interest the outcomes and conclusions.

CHICAGO, April 7, 1881.

### Operators' Opportunities.

To the Editor of The Operator:

SIR: It is discouraging to note that while operators often eagerly leave their situations when they can ill afford it, to go about the country seeking employment at higher wages, or become

discouraged and work in a spiritless and grumbling manner, as if the future contained no possibilities or opportunities for better things, they seldom give serious attention to the surest and most far reaching way by which they can ameliorate their condition, which is by constantly acquiring helpful knowledge and making daily practicable application of it.

How many operators ever stop to deliberately weigh the question: What can I do through my own individual, unaided efforts to live more happily and comfortably on my present wages and in my present circumstances? Do not most of these men occupy their spare moments in thinking out the problem how they can obtain relief? They do not seem to realize that individuals are seldom surrounded by such adverse circumstances in this world that they are left without some opportunities right at hand by taking advantage of which they can improve their lot.

For instance, an operator having a small family, after obtaining his salary at the end of the month, instead of paying off his bills contracted during the month for the support of himself and family, becomes associated with a fellow operator and wanders away to the haunts of vice and intemperance, and perhaps before he awakens from his lethargy one-third of his month's earnings is wasted, and his family receive no benefit from it.

Operators must come to understand that, as a class, they cannot command the full sympathy and respect of society until they cease to squander hundreds of dollars annually in dram shops, instead of buying with this money bread and clothes for their needy families. They must also be impressed with the importance of laying by what savings they can, so that they may become, to a certain extent, independent of their employers, and if not fairly dealt with by the latter can feel that they have the means to live on until they can obtain employment elsewhere.

J. A. H.

BALTIMORE, Md., March 21, 1881.

### The Eastern Telegraph Company of Maine.

To the Editor of The Operator:

SIR: The Eastern Telegraph Company (recently chartered in Maine) comprises the most eminent State, railroad and bank officials in the State, and also some of the most important business firms, and those connected with other local industries. Their franchise is a very liberal one indeed, permitting of their using any railroad or highway, entering any depot and the minor privileges, making this probably the broadest charter ever issued in the State. With this extraordinary privilege, and unlimited means for the extent of territory proposed (namely, a duplicate of Western Union lines from Bangor to Boston), it is not surprising that the company should be regarded with favor by any other company with whom they seek connection.

A committee of five gentlemen was appointed by the Eastern Company to meet in this city, Friday, April 1, the representatives of the American Rapid, Bankers & Merchants, Mutual Union and States Union companies. The first named company was not represented, which was attributed to the fact that the papers in pending injunction suits had just been served upon them. Their method, tariff and plant were fully investigated, however, resulting in the conviction that their system and tolls could not be adjusted in an equitable manner with the system and rates which the Eastern may determine upon. The committee was not satisfied that the patents were either profitable or practical. The Bankers & Merchants Line was not represented, having had but very short notice and not being fully organized. A correspondence is in progress, however, which may lead to something tangible with this company. The only company which produced any evidence of strength and promise of future growth was the Mutual Union, whose status was regarded with great favor by the Eastern Company. President Evans stated that the Mutual Union was not doing a public business, but that connections with exchanges and other companies could be formed over his lines. The "States" Union is not an organized company, but the originators possess valuable franchises which they seem to have no immediate intention of utilizing. Further negotiations with the Mutual Union is probable, and may

terminate in the leasing of some New York lines, for the purpose of securing to the Eastern Company an outlet for its business.

MAGAZINE ST., ROXBURY, Mass., April 3, 1881.

### Baltimore Notes.

To the Editor of The Operator:

SIR: On April 1 all the A. & P. offices in this city were closed and instruments transferred to the Western Union Co. The Domestic District Tel. Co. has transferred its messenger service to Continental Co., W. A. Dunn, Manager. These changes are due to the consolidation of the telegraph companies. Walter H. Stewart, for eight years Manager of the late A. & P., and who has been actively engaged in the telegraph business for the past nineteen years, has been appointed General Manager of the American District Co., vice Geo. F. West, resigned. Mr. West was an able manager and was highly esteemed by the merchants in his district. The Board of Trade (Mr. E. H. Cole, Manager) closed on the first, much to the detriment of the members of the Corn Exchange, as this company worked through wires to New York, Chicago and Toledo. Mr. Cole will doubtless go into other business. The American Union is still doing a good amount of business, notwithstanding rumors have gained circulation to the effect that there is to occur a general shaking up of dry bones in the operating department soon, but nothing definite is known at present. Mr. T. W. Lufrio and W. Lenz have resigned their positions in the A. U. J. A. Greenwell, of the A. & P., succeeds Mr. Lufrio. J. A. Beck has been appointed operator at Bayview Junction, P., W. & B. R. R.

The new Stock Exchange will be completed by May 1. The Gold & Stock Telegraph Company is arranging for several direct wires to New York for the transmission of quotations direct instead of relaying at the W. U. main office as at present.

EXCELSIOR.

BALTIMORE, April 11, 1881.

### Milwaukee Melange.

To the Editor of The Operator:

SIR: Beyond the closing of the Atlantic & Pacific and American Union offices in this city, nothing of importance has occurred since our last communication. The Board of Trade headquarters are now with the W. U. Chief Barker is again laid up with rheumatism, Night-Chief Fitzgerald taking his place, and Mr. Brady going on the night force. Mr. Barker has the sympathy of the boys in his affliction. Mr. Fitzgerald has lately come into possession of a wee specimen of humanity—a daughter. Mr. W. H. Mayher, formerly "rep." opr., has been appointed W. U. Night Chief, vice Mr. J. N. Bradley, resigned, to accept a more lucrative position at Chicago in connection with the St. Paul Pioneer Press. Mr. E. G. Toombs, late of the Board of Trade telegraph, Chicago, is a late addition to the W. U. night force. Mr. H. P. Nelson, erstwhile of the A. & P., is now with the W. U. The Milwaukee District now reigns supreme at the A. & P.'s former quarters. The A. U. still holds out at "the old stand."

A horny-fisted seven-foot granger-operator, an aborigine of the wilds of North Wisconsin, made his appearance here recently and a committee was appointed to attend to him. He was placed at a table to receive a special from his native haunts, and after about an hour's work completed his task, the special being a highly edifying account of his own "abduction," giving a full description of his personal appearance, etc. The special has been preserved and is now on exhibition.

It appears that Young America in Chicopee, Mass., is not as well up in the mysteries of telegraphy as the average city gamin; for a wag of that town seems to have had it all his own way in fooling the Chicopee small boy. He sent the lad to the telegraph office to have a nail keg dispatched by wire. The operator refused to send it until it had been painted, and when the boy returned with the keg done up in colors, objected that it was then too late, and instructed him to have it telephoned from a neighboring grocery. The grocer said that his instrument was out of order and sent the boy to a hardware store with a note reading "Kick me out," which request was promptly complied with.

## TELEPHONE DEPARTMENT.

Brantford, Ontario, proudly claims parentage of the telephone, since it was at that place that Professor A. Graham Bell made his first experiments.

Telephone exchanges are now being established in Chelsea, Malden and Everett, Mass. The three cities will be connected with each other and with Boston.

There are many complaints coming in against the telephone service in this city. Heavy charges and slow work appear to be the gravamen of the complaint.

Mr. Henry Goodwin has been appointed manager of the Rio de la Plata Telephone Co.'s exchange at Buenos Ayres and Montevideo, and will superintend the construction at both cities.

John Dooley, a lunatic confined in a Philadelphia asylum, labors under the strange delusion that he is a telephone. He is continually answering calls, and receives imaginary messages from all parts of the world.

The *Electrician* says that the English Post-office Department and the telephone companies have come to an agreement on the basis of a payment of ten per cent. of the receipts of the companies as royalty to the Post-office.

A woman in Maine, attempting to talk through a telephone for the first time, exclaimed, "How do you do?" and then dropped into a chair, protesting that she "couldn't say another word; she felt as if she had been talking to a ghost."

W. H. Lincoln, late night inspector and operator of the Boston Telephone Despatch Company, at the Stock Exchange, that city, has accepted a position as assistant manager of the Portland Exchange of the National Bell Telephone Company of the State of Maine.

The Telephone Exchange at Sheffield, England, intends to ask the town council to allow them to fix a microphone in the clock tower of the Town Hall, so that any subscriber may, on calling to the central office, have his wire switched to the Town Hall wire, and so hear the clock strike in his office any hour of the day.

The Chinese alphabet is so peculiar that there is great difficulty in devising any practicable systems for conveying telegraphic messages. The telephone, therefore, is received with peculiar favor by the Chinese Government, which has at length decided to establish a complete system of telephones throughout the country, commencing north of the Yang tse Kiang.

The stock of the Continental Telephone Company now stands at \$175 per share. They have just organized a subsidiary company in South America entitled the Rio de la Plata Telephone Company, with a capital of \$500,000. The object of the latter company is to establish exchanges at Buenos Ayres in the Argentine Republic, and at Montevideo in Uruguay. Buenos Ayres, which has a population of 400,000, will be connected by cable with Montevideo, which has a population of 100,000.

The annual meeting of the stockholders of the American Bell Telephone Company was held on Tuesday, March 29. The Treasurer's report was received, and showed the financial affairs of the company to be in a highly prosperous condition. The report of the President showed that, while at the beginning of the fiscal year the company had in operation 138 exchanges and 60,873 instruments, at the present time no less than 408 exchanges were in operation, or were about to open, and the number of instruments in use had increased to 132,692. The President further stated that in the United States only nine cities with a population of over 10,000, and only one city of over 15,000, was without a telephone exchange. It was also intimated that the company was earning a fair dividend. The following directors were elected: Francis Blake, Charles P. Bowditch, Charles S. Bradley, Geo. L. Bradley, Alex. Cochrane, Richard S. Fay, Wm. H. Forbes, Charles Eustis Hubbard, Gardiner G. Hubbard, William G. Saltonstall, Thomas Sanders and Robert B. Minturn.

Mr. W. H. Ash, writing from Penzance, England, in a recent note to the *Electrician*, says: "There are two cables landing here, one from Vigo and the other from Lisbon, both of which were, unfortunately for us, broken at the same

time, the former in Vigo Bay, the other about 735 miles from here. Generally one or the other is always occupied, so that any experiments of this description are not possible, but being both idle, as well as our land line, I joined the two cables together here through a telephone. The other two ends being so far away I was curious to know what I should hear, and was very much surprised to hear Morse signals. After listening some time I found it was on the Brest cable of the new French Atlantic Company, their line running from Penzance to Brest (the cable lands about three-quarters of a mile from here), and their land line going to Penzance by a different route from this company's. So that with no earth connection here, and none on the other line except at Penzance and Brest, I could read the signals distinctly. No doubt it was by the induced current, but that it can be perceived at such a distance may suggest to some still further uses for this delicate instrument."

## DASHES HERE AND THERE.

Like lightning rods, sweet girls should be—  
Cool, pointed, straight, exacting;  
Drawing the sparks—yet not too free,  
Nor harmed by their attracting.

The interior of Windsor Castle will be shortly illuminated by the electric light.

The telegraph office was destroyed at Canto Abajo, Cuba, during a recent fire at that place.

At the Paris exhibition of Electricity, M. Salignac will exhibit a plan for cooking by electricity.

A number of cities are about to adopt the electric lights, so that the people can see where the gas lamps are at night.

A copy of Dr. Sanford's Treatise on the Liver can be had free by mail on application by postal card or otherwise. See advertisement.

Entries for the games of the Western Union Athletic Club close on the 1st prox. They are expected to take place on Thursday, May 19.

An electric light machine in London, Eng., recently, caught the clothing of its attendant, Philip S. Thomas, dragged him into its toils and strangled him to death.

MESSRS. J. H. BUNNELL & Co., again draw attention to their Morse Learners' Instrument and other telegraphic supplies, in a full-page advertisement in another part of this issue.

The cable companies on the Asiatic coast of the Pacific Ocean have promised free use of their wires to the Americans who are going thither to determine the correct longitude of places in China and Japan.

A recent investigation, conducted in the physical laboratory of Harvard University, has led to the discovery of the remarkable fact that intense cold can deprive magnetized steel bars of nearly all the magnetism which may have been imparted to them.

The National Associated Press dispatch giving the result of the Cambridge-Oxford boat-race, April 8, was transmitted from the point of the finish to the London agent's office and filed with the Direct Cable Company, who transmitted it to New York in twenty-seven seconds.

Akron, Ohio, is now illuminated by the electric light, having inaugurated that system on the night of the 11th inst. The lights are placed on two towers four-fifths of a mile apart, and at an elevation of 200 feet. A person can see the time by his watch at a distance of half a mile from either tower.

Leonidas of Sparta would have been more successful in his celebrated experiment with "thermopiles" had he used some "batteries" in connection with it. Yet, "currents" are being largely exported from Greece, showing that Greece is still ahead in practical applications of electricity.

Frank Wilkeson, writing to the *Sun* of this city, says that the reason a prohibitive liquor law has found favor in the Kansas Legislature is because the people living in the dry atmosphere of that State, surcharged with electricity, cannot safely regale themselves with alcoholic drinks.

In 1879 the Western Union Telegraph office at Syracuse handled 349,089 telegrams; in 1880, 390,148, a gain of 41,059. During the same

period the Atlantic and Pacific Company's office handled 20,000 and the American Union office 5,000, making a total increase of 66,000 over 1879. The office has twenty-five operators and clerks.

If the Western Union Company should neglect to send delegates to the Paris Exhibition of Electricity, next Autumn, the newly-formed electrical society of this city may prove equal to the occasion, and appoint its own commissioners.

The Central telegraph office at Amsterdam is lighted by the Von Hefner-Alteneck system of electric lighting. The result is said to be very satisfactory, especially as regards the temperature and wholesomeness of the room.

An advertisement of Mr. H. L. Bonsteel will be found in this issue. Mr. Bonsteel is manager of the Dominion Telegraph office, at Newark, N. Y., and devotes his spare time to teaching takigrafy. Those of our readers who desire to study this system, which is warmly recommended by those who have learned it, cannot do better than communicate with Mr. Bonsteel.

Horace T. Brown sends to *Nature* a description of a thermometer which has been made for him, and which, by means of electricity, registers the temperature of distant places. He says of it: "Any number of observing stations can be established along the line wire, and if desired, the apparatus may be made automatically to register the temperature at any required interval of time."

The idea of placing the wires underground is looking up, and a company for that purpose has already been formed in Philadelphia. The wires are to be laid in terra cotta pipes, thus abolishing the necessity of opening the ground to repair defects, as in Germany, where the cables are imbedded in asphalt. In France they are burying the wires between Paris and Nancy in iron tubes.

The *Electrician* presents its readers with an engraving of the longest span of telegraph wire in the world. The wire is stretched across the Kistnah river from hill to hill, each hill being 1,200 feet high, between Bezorah and Sectanagrum, in India. The span is a little over 6,000 feet in length. The only mechanical contrivance used in stretching this cable across the river was a common windlass.

A dispatch from Paris says an unfortunate hitch seems to have occurred in regard to the response of the United States to the invitation to send representatives to the Electric Congress, which is to open at Paris on September 15. It is now proposed to organize a volunteer commission to represent the United States, for which purpose an extension of the time fixed by the French government for receiving applications has been asked for.

Mr. A. B. Smith advertises the Barron Flexible Key Knob in the present issue. These key knobs had a very extensive sale among telegraphers when advertised before, a short time ago, and the universal indorsements they received were of the most unmistakable character. There is no reason why they should not have an equally large sale now. Every one troubled with telegraphers paralysis should give them a trial.

When the report of the death of Sir Evelyn Wood, in South Africa, reached England, a telegram was sent from London to Natal, and the answer was received in two hours. The line extends through southern Europe, under the Mediterranean Sea and the Red Sea to Aden, in Arabia; thence to Durban, and land connections via Zanzibar, Mozambique and Lorenzo Marques. An answer over this line in 120 minutes should put our American District service to shame.

Messrs. Ordway & Co., whose advertisement appears in this issue, make the clothing worn by nearly all the telegraphers in Chicago, and are, therefore, known in that city as the telegraphers' tailors. Readers of THE OPERATOR in Chicago who have not heretofore patronized this firm will find it to their advantage to call upon them when next they want anything in the clothing line. Telegraphers and others outside of Chicago can have samples mailed them free on application.

A dispatch from Vera Cruz, Mexico, on the 5th inst., says: The cable steamer Dacia has completed the first section of the Central and South American cable southward. The cable surveying steamer Hornet is at Acapulco, having taken

very satisfactory soundings for the cable from Callao to Tehuantepec. The Central and South American Telegraph Company has secured all the necessary rights, and will connect with the West Coast Telegraph Company at Callao, establishing cable communication with Valparaiso, Chili.

Perhaps the best linguists in the world are the Danes. They are also nearly as expert telegraphists as the operators of our own Western Union, and that is saying a great deal. Of these two important facts the Chinese Government have become aware, and have, consequently, and very lately, signed a contract with the Great Northern Telegraph Company of Copenhagen for the establishment of a telegraph line between Shanghai and Tientsin, a distance of about a thousand miles. There are difficulties in the way of accurately transmitting messages in the Chinese language which even the telephone fails to surmount.

The London *Times*, of April 8, says:

"Anglo-American Telegraph shares are one-half of one per cent. higher. There was a sharp advance in West India and Panama Telegraph shares upon reports that Jay Gould has arranged a great combination which will include the absorption of the latter line and that the arrangement for pooling the receipts of all the Atlantic cable companies, including the new cable of Mr. Gould, is nearly completed."

A Mr. James Johnstone, of Edinburgh, Scotland, has offered to place \$125 at the disposal of the congress of electricians, which meets in Paris, Sept. 15. This sum is to be given as a prize for the discovery of the nature of electricity, and especially for the discovery of the reason why electricity unites itself into the form of a spark as it leaves the prime conductor of a frictional machine. Any electrician who thinks he can give a better reason for the formation of the frictional electric spark than that of attraction between the particles of electricity on the insulated ball, is requested to give in his answer to M. George Berger, Chairman of the Exhibition committee, Palais des Champs Elysées, Paris, France, before September 9, 1881.

At Toronto, Ont., April 5, judgment was delivered in the case of the U. S. Direct Cable Co. vs. the Dominion Telegraph Co. The facts in the case are that, pursuant to an agreement between the two companies, certain matters in dispute between them were to be referred to arbitration. The Dominion Company appointed Mr. Sampson as their arbitrator, and the Cable Company appointed by cablegram Mr. De Costa as theirs. The latter wanted to get a copy of the submission, and applied for it. The umpire had to be appointed within ten days, and the Dominion Company appointed another arbitrator named Buckley, and he and Sampson appointed the umpire. The Cable Company then took proceedings in a New York court to restrain the arbitrators. After argument, the court decided that they had no jurisdiction, when an application was made for an injunction before V. C. Blake, at Toronto. The latter has decided that the declaration asked for by the Cable Co., which is an English company, should be granted and that the Dominion Company must pay the costs, also the costs of Sampson and Buckley, who were made co-respondents.

## NEW YORK CITY ITEMS.

### Echoes from 195.

"Still struggling at the key?" is the latest salutation among the veterans of 195.

Among those already transferred from the A. U. to 195 are Messrs. Bradt, Waugh, Voyer, Curtis, Kay, Boyer and Cook.

Mr. A. S. Brown has received his reappointment from General Eckert as Superintendent of the Metropolitan (his present) district.

Many of the boys are in active training for the spring athletic games, and the favorite salutation is: "What time do you make it in now?"

All Night Chief Tobin has been able, owing to the influx of ousted talent, to recruit his force so that a great deal of "extra" service is dispensed with after 12.30 A. M.

The effervescing, sparkling freshness of one of the lady operators is noticeable in many ways. The frigid dignity of the lady manager in resent

ing undue familiarity on the part of this maiden has no effect.

Mr. Thomas Finigan was first in grasping the hands of General Eckert and Mr. Jay Gould upon their recent visit to the operating room, and the broad smile in which Tom indulged that day will not soon be forgotten.

The Atlantic and Pacific wires that have just been run into 195 Broadway work very hard, even in the finest weather. In the language of Division Chief Catlin, "to get anything upon them you have to adjust away out into Dey street."

It might do no harm to suggest, in a quiet way, to some of the new men that a too free indulgence in staring at the ladies in the City Department has in many cases, and in one instance very recently, resulted in the starrer taking an involuntary vacation.

Messrs. Clum and Jones, formerly A. & P. chiefs, were assigned to the much-coveted 12 to 9 trick, while Russell Riley does switch duty. Mr. Squires works from 5 to 12. Those men transferred from the American Union were allowed to select their hours, while the A. & P. were used to recruit somewhat reduced and not altogether desirable "tricks."

Mr. Sabine, recently transferred from the Western Union to the night managership of the A. & P., has returned, and taken his former position as Night Eastern Chief, reducing Mr. Mudgett again to the ranks. Everybody will retain the most pleasant remembrances of "Mudge's" short service as chief, and regret that circumstances replaced him.

It is to be hoped that the periodically-discussed subject of ventilation for the main operating room will not die out this time. The most sensible plan we have heard mentioned suggests the cutting of two or more shafts directly through the ceiling and upper floors to the roof. Apropos to the subject, Mr. Jay Gould is said to have remarked to Gen. Eckert, in the elevator, the other day: "We'll tear the building down and put up a new one."

Owing to the increase in business and the opening of new circuits, made necessary by the transfer of the A. and P. wires to "195," Manager Downer has increased his force. Probably 55,000 messages or over are handled daily, exclusive of press reports. The proficiency shown in handling this large volume of business is creditable to the management of the office. The company is now serving the public (in New York, at least) as it ought to be served.

In answer to numerous requests, we again insert the list of games to be contested at the W. U. Athletic Association's spring meeting, to be held on or about May 19:

One-mile walk, for those who have never won a prize; one-mile walk, handicap; 100-yard run; quarter-mile run; 220-yard hurdles, handicap; half-mile run; one-mile run; running long jump. Medals for each event. Entries should be sent to the Secretary of the Athletic Committee, 195 Broadway.

Could the question of a change in the management at 195 be left to the operators, the unanimous vote would be to have the present management retained. Manager Downer is a good executive officer, always shows earnest consideration; quick to recognize and reward merit and overlook the weaknesses of others; always approachable and ready to listen to what the accused has to say in his own behalf. He also takes a hearty interest in all that the operators are interested in; is of a genial nature and, in short, a man that those who work under him hope to see at the head of the operating department as long as he desires to remain there.

There are 41 quadruplex and 11 duplex instruments in use at the Western Union main office, of which the brokers lease 7, Chicago business employs 4 and 3 connect with Boston; Philadelphia, Washington, the Commercial News and cable departments find use for two each; St. Louis, Cincinnati, Cleveland, Buffalo, Pittsburg, Albany, Syracuse, Baltimore, Augusta, Springfield, Providence, New Haven, Norwich, New Orleans, Fall River, and "Bn," Boston, each have one, and the brokers use three more during the summer season. The cities of Chicago, St. Louis, Cincinnati, Detroit, Indianapolis and Chattanooga use one duplex each with New York. There are three "spares," and the city lines

boast of two, one to 599 Broadway, the other to 12 west Twenty-third street.

#### Other City Items.

Mr. H. L. Bailey, Special Inspector M. T. & T. Co., will read a brief paper before the N. Y. Electrical Society at its next meeting, April 21, on a portable and convenient instrument for electrical tests and for experimental purposes to the student.

The operation of the new Mutual District Messenger Company is exciting much interest, owing to the sharp rivalry which has sprung up between it and the old American District. Many of the offices have both instruments, and calls are not unfrequently made on both at the same time, the first boy to arrive getting the employment; this is the cause of many exciting races and adds greatly to the efficiency of the service. As an inducement the boys of the new company are paid in addition to a regular salary a commission on the number of messages.

At St. Francis Xavier's College, on the 31st ult., Rev. C. E. Woodman, C. S. P., lectured on "The Telephone, the Phonograph and the Photophone." The lecturer explained his topic in a clear and popular manner and illustrated the discourse with numerous graphic pictures flung upon a screen and illuminated by an electric light. He traced the history of the discovery of the phenomena of electricity and magnetism, and showed how every new revelation was grasped by the scientist and subordinated to his will in several appliances of mechanical art. At the close of Father Woodman's discourse a complimentary speech was made on behalf of the alumni, and a cordial vote of thanks was tendered to the lecturer. Archbishop Corrigan and many prominent educational officials were among the audience.

#### PERSONAL.

Mr. Fred. Smith, superintendent's clerk at Philadelphia, has resigned.

Mr. George F. Milliken, manager of the Boston (Mass.) W. U. main office, has resigned.

Mr. Heber C. Robinson, Manager of the Western Union general office at Philadelphia, has resigned.

Mr. A. L. Coffy, formerly of Brainwood, has been appointed manager of the W. U. office at Marcial, N. M.

Mr. J. W. Dyer, Manager of the Western Union office at Third and Chestnut streets, Philadelphia, has resigned.

Mr. Joseph Greene, for a quarter of a century connected with the Western Union service in Philadelphia, has resigned.

Mr. F. E. Angell, for many years manager A. & P. Board of Trade office, Chicago, has been transferred to the managership of the W. U. office, Palmer House.

Mr. John F. Zeublin has been appointed Superintendent of the Western Union sixth district, which includes the greater part of Pennsylvania, New Jersey, Delaware, Maryland and the District of Columbia, with headquarters at Philadelphia.

Messrs. F. Scott Smith, E. J. Holden, J. M. Sullivan, J. H. Hutchinson and J. H. Burke, operators in the A. & P. Office, Boston, have been each transferred to the W. U. Office, 109 State street, same city. Manager D. J. Hern has gone into other business.

Mr. Charles F. Wood, the retiring assistant general superintendent of the Western Union Telegraph Company for New England, whose service with the company ended April 1, was presented by the employes of his division with a fine gold watch and chain, suitably inscribed.

At a meeting of the Directors of the Western Union Telegraph Company, on the 2nd inst., Mr. Cornelius Vanderbilt resigned as a Director and General Eckert was made a member of the Executive Committee in place of Mr. S. F. Barger, who resigned some time ago.

The Grand Pacific Hotel office, Chicago, is believed to be the champion D. H. hotel office, fully one-third of the business being of this description. Between 43,000 and 44,000 messages were sent from this office last year. Mr. W. E.

M. Browne, the manager, was very attentive to the telegraph and telephone men who attended the recent convention at the Grand Pacific.

Mr. W. E. Jermain has been appointed manager of W. U. and A. U. consolidated lines in Elkhart, Ind. His predecessor, Mr. S. P. Wilcox, is now manager of the L. S. & M. S. Railroad office at that point. Mr. F. Arnold, formerly with the W. U. at Cleveland, O., is night manager of the same office. Elkhart city gives employment to nine first-class operators.

Mr. Patrick J. Feeney, operator at the City Hotel branch office, Portland, Me., has been transferred to Lynn, Mass., as night owl. Mr. Wallace J. Mountfort fills the vacancy. Mr. Ed. H. Smith, operator at "Px" office, Eastern Railroad Depot, Portland, has gone South for his health. John F. Malone, late of A. & P. branch office, Commercial Wharf, takes his place till his return.

Mr. D. J. Hern, manager of the Boston A. & P. office was presented March 31 with an elegant writing desk, with library attachment, from his employes. An appropriate speech was made by Chief Operator Smith, which was replied to by Manager Hern, who thanked all for their kind token of respect, expressed his regret at parting from them, and concluded by stating that his employes had his best wishes.

Miss Lelia L. Morse, youngest daughter of the late Prof. Morse, and Mr. Franz Rummel, the pianist, were married on the 4th inst., at Locust Grove, the summer residence of the bride's mother. There were many presents of rare beauty and great worth, among them a check from Miss Morse's old friend Samuel J. Tilden. The happy couple sailed subsequently for their future home in England.

Mr. Andrew Carnegie, who commenced life as a telegraph messenger in Pittsburgh, and who is affectionately remembered by many old telegraphers, is about to establish a free library for his employes at Braddock, Penna., where his steel works are located. Plans are now prepared for a large three-story building to be erected in Braddock at a cost of \$20,000. The library will consist of about five thousand volumes. The employes had in contemplation the founding of a library on a somewhat cheaper scale, and Mr. Carnegie stepped in and took the project out of their hands.

A Portland correspondent, writes to say, that the remark in the biography of Mr. McMahon, in last issue, that "his wonderful abilities are partly thrown away on the Portland duplex," shows the biographer to be "decidedly unacquainted with the facts." He adds that Operator Saylor, of the Portland office, has handled 500 messages in ten hours on that circuit; that Mr. Stanford, of Boston, has opened with 94 messages between 8:30 and 9:30 a. m., merely as a starter, and that the number sheet on one day last week indicated 964 messages being handled, only one side of the quad being used during the winter.

There was a most enjoyable social gathering at a dinner at "The Criterion," London, on the 23d ult., of the proprietors of and contributors to *The Electrician*. The gentlemen present were: Mr. A. J. S. Adams, Professor W. E. Ayrton, Mr. C. H. W. Biggs, Mr. David Brooks (Philadelphia), Mr. W. C. Cartwright, M. P.; Mr. Latimer Clark, Mr. Crompton, Mr. Brockwell Dalton, Mr. Arenberg (New York), Mr. Desmond G. Fitzgerald, Mr. J. E. H. Gordon, Professor D. E. Hughes, Mr. J. Laister, Dr. O. J. Lodge, Mr. A. R. H. Moncrieff, Dr. A. Muirhead, Mr. J. Munro, Mr. W. H. Parker, Professor J. Perry, Mr. W. H. Preece, Mr. H. E. Saunders, Mr. J. T. Sprague, and Mr. T. P. Bruce Warren. Among the toasts was one to "Absent Electricians of All Lands."

#### BORN.

BALCH.—March 31, 1881, to Mr. John J. Balch agent and operator U. P. Ry., Tie Siding, Wyoming Territory, a son.

#### DIED.

BOYD.—March 26, 1881, at his residence in Forest, O., Mr. N. D. Boyd, aged 37 years.

# All Persons Sending for

Catalogues or ordering articles advertised in our columns will do us and our Advestisers both a great favor by mentioning that they saw the advertisement in

"THE OPERATOR."

## ORDWAY & CO., MERCHANT TAILORS,

205 West Madison St., cor. Green,  
CHICAGO, ILL.

Measures can be left when in the city. Samples forwarded on application.

THE

## American Bell Telephone Co.

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly, or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This Company desire to arrange with persons of responsibility for establishing

### DISTRICT OR EXCHANGE SYSTEMS,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as agents, for the purpose of establishing

### PRIVATE LINE

AND

### CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company, No. 95 Milk street, Boston, Mass.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## L. G. TILLOTSON & CO.,

5 AND 7 DEY ST., NEW YORK,

MANUFACTURERS AND DEALERS IN

### TELEGRAPH AND TELEPHONE SUPPLIES

OF EVERY DESCRIPTION.

(ESTABLISHED IN 1856.)

109 Court Street, Boston, Mass.,

AUTHORIZED MANUFACTURER OF

## THE AMERICAN BELL TELEPHONE CO.

Magneto, Crank and Push Button Call Bells, Electric Bells, District Bells and Switches for Exchanges, Annunciators, etc.

Telegraph and Electrical Instruments, Batteries, Wire, Insulators, and Telephone Supplies of every Description.

## TELEGRAPHERS, SAVE YOUR GRIP!

USE THE

## FLEXIBLE KEY-KNOB.

It Relieves the Muscles and is Pleasant to the Touch.

IT IMPROVES WRITING, LARGELY OVERCOMES STICKING OF THE KEY AND FACILITATES SENDING.

It Prevents Telegraphers' Paralysis, and enables those who are Afflicted with that Terrible Disease to "send" with but Little Difficulty.

No. 1 shows a Flexible Elastic Key-Knob, to be substituted for the present hard-rubber knob; it will fit any key. No. 2 shows an Adjustable, Elastic Cover; it will fit any key-knob. No. 3 shows the Adjustable Elastic Cover fitted to the key-knob.

### INDORSERS OF THE FLEXIBLE KEY-KNOB.

The Flexible Key-Knob is indorsed by the following well-known Telegraphers:

Gen. Anson Stager.  
A. S. Downer, Gen. Manager of the New York office.  
Thomas Dolan, Night Manager of the New York office.  
Thomas A. Edison, Menlo Park, New Jersey.  
W. P. Phillips, Assistant General Agent of the New York Associated Press.  
E. C. Boillieu, G. F. Stewart, T. R. Taltavall, S. S. Schroff, L. B. McCarthy, Associated Press Operators; T. G. Kennedy, J. B. Gaynor and many other Western Union Operators.

#### THE FLEXIBLE KEY-KNOB AND COVER

Are in constant use on the Associated Press wire and fast Western Union circuits, and are giving universal satisfaction.

The following Letters explain themselves:

New York, May 23, 1878.  
A. S. DOWNER, Manager.—The Flexible Key-Knob is a GREAT SUCCESS. I never had such EASY sending as I have had to-night. Respectfully,  
H. H. HENRY.

Mr. W. J. BARRON.—Mr Henry is one of our most experienced Operators, and a person who would not give an opinion like the above unless the article had merit. He sends about 10,000 words per night.  
Yours, etc.,  
A. S. DOWNER.

New York, May 25, 1878.  
A. S. DOWNER, Manager.—The Flexible Key-Knob materially improves "light" writing, and it unquestionably renders continuous sending less fatiguing.  
Very respectfully,  
FRED CATLIN.

Mr. W. J. BARRON.—Fred. Catlin is probably as good an Operator as this world produces.  
Yours, etc.,  
A. S. DOWNER.

New York, May 28, 1878.  
Mr. W. J. BARRON.—After using the Flexible Key-Knob daily for more than a month, I must say that it is a decided success. It makes sending much easier; enables me to make letters with facility that have heretofore given me trouble, and is a great help in sending for a long period.  
Respectfully,  
J. B. GAYNOR,  
W. U. Tel. Co. (Main Office).

Sent post-paid on receipt of price: No. 1, Seventy-five cents; No. 2, Fifty cents.

Canadian Orders ten cents additional.

Postage Stamps taken as cash.

ACTIVE AGENTS WANTED.

It is just what every Learner needs.

ABSOLUTELY NECESSARY INFORMATION

UPON

SCIENCE, MYTHOLOGY, BIOGRAPHY, AMERICAN HISTORY, CONSTITUTIONS, LAWS, LAND TITLES, CITIES, COLLEGES, ARMY AND NAVY, RATE OF MORTALITY, GROWTH OF CITIES, INSOLVENT AND ASSIGNMENT LAWS, DEBTS, RATE OF INTEREST, AND OTHER USEFUL KNOWLEDGE.

BEING A

## PERFECT LIBRARY OF REFERENCE, IN ONE HANDY VOLUME.

510 PAGES. STRONGLY BOUND IN CLOTH. PRICE ONLY \$1.

The publisher of the AMERICAN POPULAR DICTIONARY claims for it the support of telegraphers and the public, for the following among other reasons:

It contains every word of the English language that enters into speech or writing.

The Spelling of each word is that given by the best authorities.

The Definitions are compiled from a majority of the best writers of the English language.

The Pronunciation of every word is that settled upon by the ablest scholars.

In addition to the perfections of this work as a Dictionary, it contains a vast amount of information upon many kinds of useful information not to be found in any similar work; but all absolutely necessary to every one who wishes to be acquainted with the leading subjects of conversation and composition.

TELEGRAPHERS, more than any other class of men, need a good and handy Dictionary in their office at all times. There is no Dictionary published that will give them better satisfaction than The American Popular.

Dictionaries printed in England are of little use in this country, where many words are differently spelled, and the meaning not always the same. Send for the American Popular Dictionary, and get the best Dictionary at the price published.

The American Popular Dictionary is printed from new type, with extra clear and legible face, and handsomely bound in cloth and gilt. From it a speaker or writer can glean an amount of knowledge impossible to find elsewhere collected in one book.

Worth ten times the price.—N. Y. Times.

A perfect dictionary and library of reference.—Leslie's Illus. News, N. Y.

We have never seen its equal, either in price, finish or contents.—Chris. Advocate.

Copies promptly mailed, postage prepaid, on receipt of price, \$1, in currency or postage stamps, or by Post Office order. Liberal discount to agents.

Four copies by mail or express, prepaid, \$3.00.

THE OPERATOR for fifteen months and the Dictionary only \$2.00.

## SAM JOHNSON:

The Experience and Observations of a Railroad Telegraph Operator.

By J. ALBERT CLIPPINGER,

Author of "The Pedagogue of Widow's Guich," "Samson" Papers, etc.

176 Pages. Price, in Paper, 75c.; in Cloth, \$1.

This book consists of a series of short stories or sketches, illustrative of the checkered life and experience of a representative Railroad Telegraph Operator—a near view of the daily and nightly working of the busy bees who manuate the two greatest agents of modern civilization—electricity and steam.

"Sam Johnson is one of the most entertaining books in the whole library of railroad literature. It is a series of well-told sketches and stories relating to every phase of railroad life. Some are humorous, some thrilling, some pathetic, and all interesting. The book is written by a practical railroad operator, with a ready pen and a quick eye for the salient points of a joke or incident."—Railroader.

## OAKUM PICKINGS:

A Miscellaneous Collection of Stories, Sketches, Essays, and Paragraphs, Telegraphic and General, By Walter P. Phillips, "John Oakum," with a fine Steel Plate Portrait of the Author.

Fourth Edition, 188 pp.; Medium 12mo; Paper, 50c.; Cloth, 75c.

The welcome accorded this, the first book ever published with the object of giving the telegraph profession a literature of its own, has been general and hearty, on the part of both telegraphers, press, and general reading public in all parts of the country. Mr. Phillips, the author, is well known to the fraternity as a spicy, original, witty, entertaining, and popular contributor to telegraphic and humorous literature, and his character sketches of "Jim Lawless," "Tip McClosky," "Posie Van Dusen," "Cap. De Costa," etc.—all of which are contained in Oakum Pickings—have won for him an enviable reputation as a humorous sketch writer.

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00

The three books and THE OPERATOR one year, or any of our other \$1 books..... 2.75

The three books, THE OPERATOR one year and The Dictionary, or any other \$1 book..... 3.50

"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with THE OPERATOR, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

Address: W. J. JOHNSTON, Publisher,

## A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

## Kerite Insulated Wire and Cables

A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

For sale by all dealers in Telegraphic Materials.

## THE FOLLOWING TABLE OF CONTENTS

will give some idea of the style and scope of our new book,

## TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY,

which is now attracting so much attention

PRE-ELECTRIC TELEGRAPHS.....	7
Signaling among the ancients—Telephonic system of the African negroes—Signaling by sound in Montenegro—Fire communication in war and otherwise—Dr. Hooke's telegraph—The semaphore—Semaphoric blunder and its result—The word "telegraph"—Prediction quoted by Addison.	
THE ELECTRIC TELEGRAPH—ITS BEGINNING AND DEVELOPMENT.....	14
First lightning-rod man—Frictional electricity discovered—The Leyden jar—Experiments to Franklin's time—His famous kite experiment—Robert Stephenson's boyish imitation—Lomond's electric signals—Lesage's invention of electric telegraph, using twenty-four wires—Reiser's thirty-six wire telegraph—Succeeding experiments to Morse and subsequently to present time.	
INTRODUCTION OF THE ELECTRIC TELEGRAPH IN THE U. S.....	29
First American line—Apathy of scientists, press and public—Why the Herald refused to encourage the telegraph—Cornell and Morse—First apparatus—Interesting relic—First week of telegraph—Slender returns—Humors of early-day telegraphy—Countryman, turkeys and telegraph—Mr. Stearns and obstreperous church bell—Honor to whom honor is due—Ronalds—Morse—Henry—Vail—Claim for laborers—"Be jabbers, who dug the post holes?"	
CHAPTER ABOUT OPERATORS AND MESSENGERS.....	50
The operators' view of human nature—Their faithfulness—Their literature—Their difficulties and trials—Epileptic telegrapher—Armless operator—Deaf operator receiving by sound—The "lightning striker's" blunder and a case of jealousy—Recognizing by touch—Love over the wire—Love disappointment in humorous verse—First marriage by telegraph—Absconding operator caught by novice—Wonderful speed in telegraphing—Messenger service—District telegraph boys and the various duties they perform—Anecdotes of them—Uniformed messenger mistaken for policeman.	
THE TELEGRAPH IN WAR.....	70
Earliest military signaling—Introduction of field telegraphy—Field telegraphy described—Dangers to apparatus—Firing guns by electricity—Telegraph in civil war—Its great value—What General Sherman said of it—Origin of U. S. Military Telegraph—Cost of service during war—Duties of cipher operators—Official acknowledgment of their services—Anecdotes of military operators' ready wit, heroic courage and nervousness—Funny war story—Another—Military operators' poor quarters—A provident telegrapher—Richmond taken—Receipt of the great news—Lincoln's assassination—Grand feat of Prussian soldier, and heroism of French female operator.	
CABLE TELEGRAPHS.....	95
General—The Atlantic cable—First suggestion of it—Its origin—Organization of company—Laying cable—The Great Eastern—Discouragements—First message—Suggestor wittily silenced by Mr. Field—Cost of first Atlantic cable—Recent improvements in cable laying—Mr. Field's services—Cable operators—Cable codes—A specimen—Its interpretation.	
HUMORS OF THE TELEGRAPH.....	107
Economical Irishman—Timid old lady—Apprehensive Texan—Witty, incongruous and rhyming telegrams—A "killing" blunder—The "additional wurred"—A furious message—Satchel by telegraph—Snubbing a king—A proper old lady—Little "Johnny Russell"—Peter to Margaret Flagarty—He couldn't be fooled—"She writes like a man"—Model (?) Maine man—Hollow and "hello"—Fooling savages—"Onnateral fixins"—Chicago and —Witty illustration—Electrifying loafers—Shocking the negroes—Blind-folding the "masheen"—A crammer.	
TELEGRAPHIC "BULLS".....	123
A fatal "bull"—Matrimony killed by a "bull"—Instances of operators' "bulls"—A lord's mistake—John Brown and Seaton Bros.—Ale or oil—Too much coffee—Blessings in disguise—A profitable mistake—A military "bull" that was not all a "bull"—Senders' "bulls"—Habit and habit—"Bulls" from bad spelling—A fishy story—Tragic "bull"—Injustice to operators.	
LIGHTNING FREAKS AND TRAGEDIES.....	138
Deaths from lightning—Effects in different countries—A triple tragedy—Curious freaks of lightning—Some wonderful instances—Lightning in telegraph offices—Operators killed.	
SHARP PRACTICE BY TELEGRAPH.....	143
Abuse of General McClellan's name—A modern "St. John"—Big swindle in Toledo—"Spiritualistic" swindling—Rappers' tricks—Their magnets—How to make them—Sir Charles Wheatstone's experiments—Two good stories of sharp practice by operators—Tampering with cipher message—The biters bit—Great bank swindle—Barb's telegraphic trap for burglars.	
THE TELEGRAPH AN UNIVERSAL INSTITUTION.....	160
A well-traveled message—Spanish peasants and telegraph—Telegraph in Morocco—China—India—The East in general—Japan—in Africa.	
THE WEATHER REPORTS.....	168
Death of General Meyer—His account of storm signal system—Its value to commerce and agriculture—The New York station—Cipher reports of weather—Difficulties of signal service—Early opposition—Origin of weather reports in the United States—Smithsonian Institution—Professor Henry.	
THE RAILROAD TELEGRAPHIC SYSTEM.....	179
Originated in England—First instance of train dispatching in this country—System at Grand Central depot—Moving trains by telegraphic orders—Official instructions—Train dispatchers and operators—Their responsibility—Thrilling incident—Operator who "forgot"—Noble operator—Latest inventions in railroad signaling—The train telegraph—No more screaming engines—Supplying locomotives with water by electricity—Fun on the railroad—Waking the Pullman porter—Operators' anti-suporific.	
ELECTRICITY AND LIFE.....	202
General remarks—Electric girl of La Perriere—Electrical lady of Nevada City—Electricity on dinner table—Feeling pulse by telegraph—Development of growth by electricity—Uses in surgery and dentistry—Electricity as a healer—An "anti-fat" story.	
OUTGROWTHS OF THE TELEGRAPH.....	218
The electric light—Edison's description—The light at Niagara—Experiments in San Francisco—Proposed illumination of Holyoke—Use in stores, steamships, and in war—The telephone—How constructed—The German name for it—Its invention—Telephone service meter—Transmitting sermons by telephone—First instance—Mr. Beecher's—The telephone in Jersey City law courts—Communicating between ships—Use in wooing—In military operations—Music—Humors of the telephone—The singing telephone—Yarn from Pine Bluff—Joke on reporters—One for Dawdles—Marriage by telephone—Telegraphing by light—The photophone—Electrical egg hatching and seed germination—Theatrical thunder—Toothache cured by electricity—Gas lighting and bell ringing by same means—Electricity as an umbrella—In taming horses—In connection with Moody and Sankey's meetings—Telegraphing by electrical air currents—Maps by telegraph—Magnetic magic writing—Electric driving power—Electricity in managing refractory horses—Engraving by electricity—Diagrams of targets over the wire—Electric combs and brushes—New uses for the sun's rays—The ocean a source of electricity—Suggested use of electricity in executing criminals—Slaughtering cattle and killing whales by electricity—Electric clocks that require no winding—Telegraphing by steam at sea—Electricity in steam—The Edison electric locomotive—Description of it—Electricity aiding weary cash girls—Conclusion.

## THE HUNTING CASE WATCH

**STEM-WINDING AND STEM-SETTING**

which we offer to the readers of this paper is First Class in every particular. Heretofore a low-priced watch has been the poorest of investments, being of no value as a Time-keeper, and a constant source of annoyance and expense to its owner. This Watch is a marvel of Accuracy and Cheapness, and we are now, for the first time in the world's history, able to offer a low-priced, perfectly reliable, stem-winding and stem-setting Hunting Case Watch, suitable for use on Railroads, Steamers, and all other places where accurate time is required. The annexed cut shows the Watch, Chain and Charm reduced in size about one-half. The movements are of Swiss make, known the world over for their excellence and fine finish, having eight jewels, with lever escapement and expansion balance; the handsome hunting case is finished from a composition of metals, so closely resembling Gold that it is almost impossible for the best judges to distinguish the difference even by chemical test, it is the Best Substitute for Gold ever discovered. The chain we send with the watch is finished the same, and we defy good judges to detect that they are not solid gold. The watch is thoroughly protected from dirt and dust to which a key-winding watch is daily exposed—it is not necessary to open the watch to wind or set it as it is wound and set with a stem and spring. We know this Watch will meet with and grow in favor as its merits and good qualities become known. There is now a growing demand for such a watch, for, more than ever before, are the acts of everybody governed by and performed on time, and we believe that the vast army of Professional Men, Clerks, Mechanics, Farmers, Laborers and Railroad Employees, will appreciate a Good Watch at a Cheap Price which they can rely upon for accurate time. We wish to put you on your guard, as there are numerous irresponsible firms advertising cheap watches that are worthless as time-keepers. We warrant each watch that we ship to reach you in good running order, and if not perfectly satisfactory to you on receipt we will refund your money.

**OUR GRAND OFFER!** In order to introduce our goods in every neighborhood in the United States, and to make customers and agents for our watches and other goods, we make the following unprecedented offer, viz.: Upon receipt of only \$12.00, accompanied by this Advertisement, on or before July 31st, 1881, we will forward, all charges pre-paid, and guarantee to reach you in good order, one of the above described Stem-Winding and Stem-Setting Watches, securely packed in a wooden case; and we further agree to send with each watch, a beautiful Chain and Onyx Charm (as shown in cut) or we will send the Watch without the Chain and Charm for \$10.50. If you wish we will engrave any monogram you order on the case. (For a specimen see our monogram as shown in cut.) The case is perfectly smooth on both sides and the initials of a name engraved in a monogram looks very beautiful. We can only send out a limited number of watches and chains at price marked, and to protect ourselves from jewelers and dealers ordering in quantities, we will insert this advertisement in this paper but One Time, hence require you to CUT IT OUT and send to us with your order, that we may know that you are entitled to the benefits of this offer. Under no circumstances will we sell more than One Watch, Chain and Charm as above offered, to any person sending us \$12.00 and this advertisement. Many of our agents find ready sale for this Watch and Chain at \$25.00 to \$35.00. We will mail you a bundle of our catalogues at the same time we send watch, and feel sure you will be so well satisfied that you will oblige us by distributing them among your friends, and aid us by showing them your watch and chain; you can in this way assist us in selling other goods of Standard Quality, which are manufactured from new and original designs, and which we Guarantee to give satisfaction. Money can be sent by Registered Letter, Check, Post Office Money Order, or by Draft, made payable to our Firm. We will send the Watch C. O. D. with privilege of examination, provided you send \$2.00 to guarantee us against loss by express charges; but if you send \$12.00 with your order, we will pre-pay all shipping charges. Order on or before July 31st, 1881, as this agreement is void and will not be honored by us after that date, as to our reliability we refer to any Bank in this City. Address

**G. W. PETTIBONE & CO.,**  
No. 25 Maiden Lane, New York.

Each Watch warranted to give perfect satisfaction.

## SPLENDID IMITATION GOLD WATCHES,

**FOR TRADING AND SPECULATING. ONLY \$6.**

The Watch which we offer for sale is a good imitation of a Gold Hunting Cased Watch in color and appearance. The metal is a composition of other metals, so closely resembling gold that it is difficult to detect the difference except by chemical test. The works embrace the celebrated IMPROVED AMERICAN MOVEMENT and EXPANSION BALANCE. The case is Massive, Strong, and Exceedingly Handsome. The illustration is only half size and will give you only a faint idea of our justly celebrated Watch. This watch you can sell for \$15 to \$20, and take any goods you can find a market for in exchange. This will enable you to make a profit of \$10 to \$15 on the Watch, also a profit on the goods. For this reason Farmers as well as Agents can engage in this new and highly remunerative field of easy labor. We will send the watch by registered mail free of all charges on receipt of \$6 and guarantee safe delivery or we will send it C. O. D. on receipt of \$2.00 on account. Splendid IMITATION GOLD CHAINS only \$9 each. Medallion Charms 50 cents extra. This watch is extensively advertised and sold by other firms at \$10 each. Don't pay Ten Dollars when we will sell you precisely the same watch for \$6. We sell a great many and are willing to sell you a single watch, knowing you will order a number at a time when you find they are really good and saleable.

**World Manuf'g Co. 122 Nassau St. N. Y.**

## A PRINTING OFFICE FOR ONE DOLLAR

Children learn arrangement of letters into words and words into sentences without a teacher.

**THE WORLD'S SOLID RUBBER FAMILY FONT** for marking Linen, Cards, Books, &c. Combines the convenience of metal type, with the flexibility, durability and elegance of the rubber stamp. For One Dollar you get everything shown in the cut, with 125 to 150 letters, Ink, Holder, Pad, Two-sizers etc. in neat box with directions, the price you pay for our name. Price by mail, \$1. Catalogue of Agent's goods free.

**WORLD MANUFACTURING CO. 122 Nassau Street, New York.**

## The Showman's GUIDE.

This book contains most of the marvelous things in ancient and modern magic, and is the text-book for all showmen. It shows how to knock a tumbler through a table; to dive one tumbler through another; how to make protean liquid; to make a watch stop or go at the word of command; how to walk barefooted on a hot iron bar; to discover any card in the pack by its weight or smell; to turn water into wine; how to eat fire, to dip the hand into water without wetting it; how to fill a glass with two different liquids, without mixing them; how to light a candle by a glass of water; to freeze water by shaking it; to break a stone with a blow of the fist; to tear a handkerchief into pieces, and make it whole again; how to fire a loaded pistol at the hand without hurting it; to change a bowl of ink into clear water with fish swimming in it; to produce candles, nuts, etc., from a handkerchief; and many other tricks too numerous to mention.

Price 15 cents. Address  
**WORLD MANUFACTURING CO.,**  
122 NASSAU STREET, NEW YORK.

## THE MYSTERY OF LOVE MAKING SOLVED

**Or an Easy Road to Marriage.**

Those in Love will find in this Book strange Secrets always hidden before to mankind, and an Easy Way to Marriage, also many Ancient Secrets that the married should know. If a wife is neglected by her wayward Husband this Book will surely reclaim him to his first love. It proves that Failure to Win the object of your Choice is impossible. We have transacted every country to get these Secrets of Love Making. They will cause millions of Hearts and Hands to be United in Marriage. What strange things regarding Love Making you can find in this Book. If your Love is not reciprocated, this great Book will open wide the barred door, and make Love's Pathway clear. Start Right and the Battle is Half Won! This Book sent by Mail for Ten Three cent stamps. Two Books for 50 cts. Five Books for \$1.00

**EAST TWENTY-FIFTH ST., N. Y.**

ESTABLISHED IN 1847.

## S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description, under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA for Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds.

- Submarine Telegraph Cables, 50 varieties, one to ten conductors.
- Submarine Telegraph Canal Cables—any number of conductors.
- Aerial and Underground Cables of all styles. Hemp armor covered.
- Lead-Covered Telegraph Cables, one to seven conductors.
- Office Cables, one to seventy-five conductors, gutta-percha and cotton-covered.
- G. P. Insulated Wire of all sizes.
- Fuse. Leading and Connecting Wires for submarine and mining purposes.
- Marks' Compound Office Wires, various sizes, for office, underground, and outdoor use.
- G. P. Office Wire, cotton-covered.
- Flexible Elevator Cables, any number conductors; desired, of every style, and for all purposes.
- Compressed Electric Cotton and Linen Double and Triple Covered Cordage any style or pattern.
- Burglar Alarm, Call Bell and Annunciator Wires, double cotton wrapped and saturated with any preparation.
- Magnet Wires, copper and German-silver, cotton, silk, and fibre covered.
- Copper Wires, specially covered for electrical lightning purposes.
- Telephone Flexible Cords and Magnet Wires, finest and best manufactured.

## A CARD.

I have been using the Western Electric Switch and doing far better work than I could do with a Gilliland, or any other pin switch, but your board is par excellence and I can do work with it at least 25 per cent. faster than with any board I have ever seen.

C. W. ROSS,  
Columbus, Ohio.

The above testimonial appears in a circular just issued by C. E. Jones & Bro., of Cincinnati. I desire to say that its publication is entirely unauthorized. In the early stages of the "Jones' Crank Board" I did use, at various times, practically the language attributed to me. However, I have since, both in person and by letter, repeatedly withdrawn the remarks, saying that, while the principle is an excellent one, the board, in my opinion, will not give satisfaction until it is perfected, mechanically and electrically. I consider it decidedly unbusinesslike for a firm to publish anything said or written them, except by permission of the author.

COLUMBUS, O., March 23. C. W. ROSS.

### THE LINEMAN.

A merry life the lineman leads,  
Although a restless soul ;  
Untrammelled by the ties of place,  
He roves from pole to pole.

Serene, aloft, in every storm,  
Though never known to boast,  
He twines his leg around an arm,  
And sticks right to his post.

The common ills that vex mankind,  
Of whatsoever shape,  
Afflict him not ; for him, at least,  
There's always some escape.

In vain may grim and grizzly Want  
Her bony finger point ;  
Though famine reign on every hand,  
He still can find a joint.

And when his crosses multiply,  
As they will do in time ;  
He simply packs his pliers up,  
And seeks some other climb.

At last he meets some gentle maid,  
Exceptionally nice ;  
Then, scorning pompous phrase, he says,  
"Come, let us make a splice."

Resolved his vises to discard  
And no more faults to find ;  
To cultivate, in homely joys,  
A calm, contented mind.

So glide his days, on pleasant lines,  
All toil and trial past,  
Through mellow years, until he finds  
The perfect ground, at last.

### Our National Portrait Gallery.

V.

JOHN CALVIN SHERER.

The worthy subject of our sketch to-day, Mr. John C. Sherer, is at present in the service of the Western Union Telegraph Company at Los Angeles, Cal. He is a fitting representative of the professional merit and intellectuality of the Pacific Slope ; and, in a general way, represents a numerous class of excellent American telegraphers who are little heard of, and whose rule of life evinces a greater determination to attain practical results than to court distinction as "leading" men—those quiet workers, of whom the world hears so little, but to whom it is so largely indebted.

Mr. Sherer was born in Cecil County, Maryland, May 6, 1852. A limited attendance at the common schools, supplemented by the most careful home instruction, and completed by a year's attendance at the Millersville (Pa.) Normal School, and a short term at a college in Poughkeepsie, N. Y., gave him a good education.

In 1869 he was initiated into the mysteries of

dots and dashes, and 1871 found him employed by the Philadelphia Local Telegraph Company, a preparatory school from which have graduated into the Western Union some of the finest and most successful operators in the country. Here

matter of the proper working of long circuits. Yreka office is a busy and very important repeating station between 'Frisco and Portland, Oregon, and has sheltered some of the most famous operators in the business ; while to have worked

J. C. SHERER, OF LOS ANGELES, CAL.

he remained for four years, gaining the complete confidence of his employers, and laying the firmest foundation for success. Operator-like, he must needs travel, and in May, 1875, he started overland for California. He was employed in San Francisco by the Pacific & Atlantic Company, and later by the Western Union, at their old main office on California street, and in August of the same year was transferred to Yreka, Northern California. This, too, is a fine school for operators in the

satisfactorily in Yreka office is of itself a certificate of efficiency.

The glories of the Centennial Exhibition brought Mr. Sherer back East, and he was soon found in the Western Union office at the Transcontinental Hotel, near the Main Building, in Fairmount Park. Upon the close of the Exhibition he became night manager of the Western Union Third street office in Philadelphia, but soon afterward returned to California by steamer, via Aspinwall and Panama. In No-

vember, 1878, the Western Union transferred him from their San Francisco main office to Los Angeles. Being still unmarried and very pleasing in manner, it is needless to say that he has become an object of great attention in the beautiful "City of the Angels."

As an operator, Mr. Sherer ranks "first-class," although, while admitting his qualifications as an electrician of more than ordinary merit, he disclaims the right to be ranked with our "fastest" operators. He believes that operators—even when rated in a lower standard—who can always be depended upon to do their work conscientiously and reasonably well, and whose habits are characterized by temperance, honesty and general morality, are of more value to, and more valued by, their employers than many more brilliant workmen who, with unapproachably "fast" records as manipulators and bizarre artistic proficiency, are yet lacking in many of the better elements of manhood.

Like many other telegraphers, Mr. Sherer is intimately connected with the press, and takes an active and creditable interest in literary matters. While in Philadelphia he was an occasional contributor to the *Sunday Transcript*, of that city, and the *Danbury News*. During the late Presidential contest he was a regular contributor to the campaign literature of Los Angeles, and although he can hardly claim that his efforts secured the election of General Garfield, he seems fully satisfied that his heavy leaders were, at least, not without *weight*. He is now the "Special Correspondent" of the Philadelphia *Bulletin*, and a regular contributor to THE OPERATOR. Altogether, his literary work—of which there is a fair specimen in the touching poem "The Christmas Tree," published in that popular work, "Christmas Evergreens"—is probably better known to the general public than to operators in particular.

Mr. Sherer works always in a modest way, but displays an active interest in any means calculated to advance or maintain the interests of the fraternity, and takes an evident pride in his profession, in which he always seems content to consider himself an humble worker. In this respect he is a model operator, and his methods are well worthy of emulation. Faithful and patient, earnest and true, always on hand when wanted, with his naturally keen perceptions sharpened and brightened by extensive travel, his painstaking assiduity and sterling qualities deserve the fullest recognition.

#### The Chicago Police Telephone and Patrol System.

Through the courtesy of Mr. J. P. Barrett, Superintendent of the Chicago Fire and Police Telegraph, the delegates of the National Telephone Exchange Association, immediately after the adjournment of the convention, examined into the workings of the above novel and valuable system. Its success in Chicago has been very marked, the arrests since its adoption being nearly doubled, while a great decrease is shown in the number of crimes reported.

The system, which may easily be understood by reference to the illustrations given, consists of telephone stations, located along the beat of the patrolmen, and connected by wire to the central police station. At these telephone stations the instrument is placed either in a sentry box (fig. 1), of which there are 91 already established, or in private residences or stores. The district box used is the Field & Firman eleven-call box, made by the Western Electric

Manufacturing Company. The telephones are the Edison carbon transmitter and the Bell telephone receiver. Keys to the sentry boxes are put into the hands of all policemen and of responsible citizens living near the boxes. The sentry box doors are secured by patent trap locks that retain the key, and as none but police officers are in possession of release keys, the person opening the box must await the arrival of an officer or lose his key. The keys are numbered, and the names of their holders recorded, so that the sender of a false alarm may be detected.

Inside of the house or sentry-box described, there is a box about the size of a fire-alarm box (see figs. 2 and 3), and through an opening in the end of this box projects a lever; inside of the

FIG. 1.—SENTRY-BOX, WITH DOOR OPEN.

box is a telephone and the usual mechanical contrivance for transmitting the arbitrary call. None but officers are in possession of keys for the inside boxes. All the inside boxes are connected with the station in the same manner as the fire alarm, and the signal is registered on the same kind of a register as that in use in all electric fire alarm systems. A person wanting the services of a policeman opens the outside door, and without opening the inside box, pulls down the lever at the side of the box; the signal is immediately registered in the station, where there is a detail of three men, with a horse and wagon, who are furnished with all facilities for quick hitching, and who immediately respond to all calls. The officer on post is required to report by telephone once an hour at night and once every half hour during the day time. He can also receive information of crime committed in any other part of the city, and is required to report all that comes to his notice of any importance at any time during the day or night, without leaving

his post. In cases of emergency he can use the arbitrary call, which will bring the patrol wagon to any box, or he can use the telephone and have assistance at any place that he may designate. When the system is complete there will be an alarm bell on the station, and in case of murder, burglary, larceny, or any crime of which the entire force should be notified immediately, a signal will be struck. On hearing this every

FIG. 2.—ALARM-BOX WITH DOOR CLOSED.

officer on duty will report at the box on his post when all can be informed of what has occurred and the officer in command can order all his men to any given point without delay.

The system is capable of almost indefinite extension. The signal boxes can be placed in business houses, banks, private residences, etc., thus communicating directly with the police station. The cut given fully explains the uses of the signal box, as the full directions are given on its face. When a signal box is placed in a private residence, a key of the house is left at the police station, under seal. As will be noticed by the cut, the nature of the service required can be communicated to the police in giving the call, so that in case, for instance, of burglars, the occupants of the house can remain snugly in bed, with their heads covered up, while the policeman answering the call (breaking the seal) takes the key of the house from its place, and steps quietly in at the front door, to the surprise

FIG. 3.—ALARM-BOX WITH DOOR OPEN.

and confusion of the enterprising burglars. Before retiring, the pointer should be placed on division No. 10, "Test of the Line," and the answering ring on the bell shows that the line is all right and in good working order. An initial charge of \$30 is made for placing the signal box in the house, after which the lines are kept in repair by the city, without further expense. This is done to encourage the introduction of signal boxes into private houses.

The patrol wagons (fig. 5) are models of convenience and adaptability for the work. They combine lightness and strength, and are conspicuous by the blue body and bright red running

gear. They are fitted with an alarm gong similar to the fire department vehicles, and as will be seen from the test below, make splendid time in answering calls. Under the seats, which run lengthwise on each side of the box, are compartments for hand-cuffs, come-alongs, clubs, blankets, canvas stretcher, ropes and other articles that are found necessary or convenient. The stretcher is ingeniously arranged, and is the most perfect device for the purpose desired that we have seen. The stretcher, when not in use, is rolled up on the poles and placed in one the compartments under the seat. When required for use the stretcher is drawn out through a small door at the end of the wagon, and four hooks, which accompany it, are fitted in their proper places, two at each side of the wagon. In these hooks the poles attached to the sides of the stretcher are placed, and the canvass hangs free between the seats of the wagon, so that the jolting of the wagon is overcome. The stretcher can be lifted from the wagon and carried without disturbing the patient. For obstreperous prisoners, there is a ring in the floor of the wagon box to which the belligerent party can be tied down and secured. The wagons were designed by Lieut. John Bonfield, who is in charge of the telephone system, and who, together with Supt. Barrett, is deserving of the credit of originating and perfecting the system.

A test call, made by Supt. Barrett for the benefit of the visiting delegates, but without any previous announcement to those who were called, brought a wagon and three officers to the sentry-box from which the call was made—two-

killed, 1; dead body taken to Morgue, 1; false alarm by citizen, 1. In addition to these were various others not mentioned. Four test runs were made, and sundry incidental duties performed, such as delivering orders, and trans-

the fire engines summoned. In a recent article on this system, the *Scientific American* calls attention to some of the above points in the following language:

"The object of the system is twofold; to increase the promptness and efficiency of police attendance in cases of emergency, and to lessen the number of patrolmen and the consequent expense of the police force. The urgent need of a public watchman or constable at any particular point in any American community is altogether exceptional, and the tendency is therefore to give the policeman a long beat to traverse. The chances are that he will be out of the way when an accident happens; and evil-doers may take advantage of his known absence to disturb the peace or invade the property rights of citizens. To provide against such exigencies by largely increasing the number of policemen is obviously much less economical than to quicken the working of the police system by putting every patrolman within the reach of instant communication with the substation to which he is attached; or if need be with the central station or police headquarters, at the same time giving every orderly citizen, in case of need, the means of calling upon the same authorities with the least delay."

We venture the prediction that at no distant date this system will be in successful use in very many of our Eastern cities and towns. Several of the delegates were so well pleased with its practical working, as explained by Superintendent Barrett, that they announced their intention of making an effort on their return to have the system introduced at once in their own cities.

The Swan incandescent lamp, essentially identical in principle with the Maxim, Edison, and

FIG. 4.—ELEVEN-CALL SIGNAL BOX.

porting police officers from place to place.

Although the new system is proved to be a necessity in large cities, yet it is in smaller cities and towns where the force is small, and the territory large, that the best results are looked for. It combines the police and the fire alarm systems, and practically multiplies the force on duty. By

FIG. 5.—PATROL WAGON.

thirds of a mile from the police station—in two minutes and forty seconds.

The following statistics for the month of January, 1881, give an idea of the actual character of the work performed by the aid of this system: Alarms answered, 179, covering 307 miles; arrests, 88; injured persons carried home 20, to county hospital, 9; destitute and insane persons and children taken to proper asylums, 11; alarms of fire, 13; disturbances suppressed, 16; streets blocked by teams cleared, 2; wild steer

judiciously distributing the boxes over the town, the citizens can do their own policing. They can instantly summon aid from the station or headquarters, where the small number necessary to respond to the calls is all that need be retained in actual service. It is easy to figure the saving that can thus be effected, and at the same time the best possible service secured. As a fire alarm alone, the system is invaluable in smaller towns, where a building is often almost entirely consumed before a general alarm can be given and

other like electric lights in closed globes, is soon to be introduced as a "safety lamp" in some English collieries. Mr. Swan says that a light equal to 250 standard candles could be obtained by the expenditure of one horse-power at the dynamo-electric machine, and Dr. Wallace finds that one horse-power in gas gives only 100 candles of illuminating power. There is an increasing conviction that electricity will displace gas almost altogether as a means of lighting, but that the use of gas will be greater, nevertheless, as its utility for cooking, heating, and motive purposes is growing in appreciation.

### Manufacturers' Exhibits at the Telephone Convention.

Below will be found a carefully prepared report of the exhibits made by the several manufacturers at the recent telephone convention at Chicago, with especial reference to the prominent new and valuable features in each exhibit. We are compelled to defer mention of the exhibit of Messrs. C. E. Jones & Bro. until next issue, by reason of a disappointment in obtaining the necessary cuts. The cuts are being prepared, but could not be finished in time for the present number.

The Western Electric Manufacturing Company exhibited a large variety of telephonic apparatus and supplies, including several exchange systems, underground and overhead cables, magneté call-boxes, insulated wire, telephone cords, &c.

The exchange systems exhibited were the

central office outfit consists of a spring-jack for each subscriber, a telephone for the listening operator, and plugs and cords for connecting. There is no annunciator drop. The subscriber requires only a battery bell and switch in addition to his telephone. To call the central office, the subscriber takes his telephone off the hook and speaks directly to the listening operator over his individual wire. To connect two subscribers, the operator simply inserts two plugs connected by a cord into the spring-jacks of the two subscribers. The act of inserting the plugs puts battery to line and rings up the second party, at the same time notifying the first that the connection is completed. The conversation between two subscribers is carried on with absolute privacy, their wires being entirely disconnected from the rest of the system; but either one can at will place himself in communication with the central office and order a disconnection.

This system is a new invention, and has just been put into use at Keokuk, Iowa, where it gives excellent satisfaction. Several other ex-

The collection of insulated wire, telephone cords, line wire, etc., was very complete. A specialty of this exhibit was a very elaborate display of cables and cable materials and apparatus. There were samples of telephone and telegraph cables, containing from two to one hundred wires, for underground and aerial use, different styles of terminals and lightning arresters, wire for cables in various stages of manufacture, a model of a cable machine, samples of oil, both ordinary and specially purified, for cable use; various kinds of joints for iron and lead pipes, under-

WESTERN ELECTRIC MAGNETO CALL BOX.

CLUB SYSTEM.

LAW BATTERY, COMPLETE.

ground test boxes and splicing boxes, maps and diagrams of cables already laid, etc.

There are now a large number of Brooks' underground cables in use throughout the country for both telephone and telegraph lines. There are no less than eight in Milwaukee and four in Chicago, mostly 50-wire cables. There are also cables at Toledo, Buffalo, St. Louis—across the bridge—Louisville, and many other places. Some of these cables have been in constant use for more than two years, and show no signs of deterioration.

A system of main battery transmission was

BATTERY WITHOUT JAR.

standard switch, the duplicate switch, and the Wiley & Scribner exchange system.

The standard switch is intended for exchanges which are not so large as to require a duplicate board, say up to four or five hundred subscribers, and is largely used in this country and abroad. It is very neat and compact, the entire apparatus for a 50-wire section occupying a space only thirteen inches wide. It is an economical board to work, as is shown by the large number of subscribers handled by a single operator. At La Fayette, Indiana, 160 lines are worked by one operator, and at other places nearly as many. The annunciator has a very simple and effective local attachment for night-bell.

By means of the duplicate switch one or two thousand subscribers can be handled in one office just as promptly and satisfactorily as one or two hundred by other systems. The operation of connecting two subscribers at the switch board consists simply in inserting two plugs. The operator is always listening, so that the calls are instantly attended to. This system is in use in Chicago for 750 subscribers in one office, and in Indianapolis for above 600 in one office.

The Wiley & Scribner exchange system requires less apparatus than any other in use. The

changes have decided to replace their present switches with this system.

The club system is a complete telephone exchange system for a small number of wires—say ten to twenty. The drops and spring-jacks are the same as are used in the standard and duplicate switch boards. This allows the utilizing of old apparatus whenever a small exchange grows so as to require a larger board.

The pole changer shown for answering calls in the central office is a very effective instrument, ingeniously designed and well constructed.

The Haskins individual bell is a complete system for individualizing any number of subscribers connected with the central office on one line.

The Warner individual bell is made for the purpose of individualizing two stations on one line.

The magneto call box now made by the Western Electric Manufacturing Company embodies all the latest improvements. It has an excellent generator and an improved bell, which rings very loudly. The automatic crank switch is a very good one, allowing the crank to be turned in either direction. There is a battery box and base board, and the telephone switch is so arranged that the circuit can never be left open.

shown, by means of which all the transmitters in a telephone exchange system are worked from one main battery at the central office, thus dispensing with local batteries at the subscribers' offices.

Telephone companies have long desired a cheap, compact, simple and durable transmitter battery, and very many forms with various combinations of elements more or less satisfactory have from time to time been tried.

The "Law" battery, cuts of which are here given, is one which seems to meet all these requirements, and to possess special advantages as a telephone battery. Although but recently put upon the market—barely two months ago—and until now not advertised, no less than two thous-

and cells have already been sold. This fact indicates its remarkable popularity and success.

Among the claims made for this battery, the following are of the utmost importance, viz :

Low cost of maintenance and renewal.

All parts of the battery exposed to view, so that any fault may be seen at a glance.

On account of the character of the cover, the water can not evaporate, or the sal ammoniac-escape.

The connections do not corrode.

The first cost of the battery is less than that of any similar battery.

Extreme simplicity.

The size of the jar is about the same as the Le-

ment is needed to show the advantages of an individual signal, by which the station desired is called and the bells at all other stations left undisturbed. To accomplish these results many devices have been produced. Some of them are good, some indifferent, some very bad. Some are "marvels as mechanical and scientific curiosities, but totally unfit for the purpose intended. Some are mental visions that could not be materialized in metal."

The Bliss Individual Signal apparatus is simple in construction, rapid in action, and safe and satisfactory in results. Fig. 1 shows the box open, exposing a small train of clock-work, the necessary connection wires and an electro-

the bell at the station represented by that number is automatically thrown into the circuit and continues so until the pointer has passed that division. Thus station 2, for instance, can be rung up only while the pointer is passing division 2 of the dial-plate, and at that time no other station can be rung up.

Fig. 2 shows the box closed, ready for a call.

Fig. 3 shows the appearance of the lift and springs within the clock at station 4, in position

BLISS INDIVIDUAL BELL, SHOWING BOX OPEN.

clanché, and fits the standard size battery box. The shape of the parts may be seen in the cut.

The positive pole consists of two plates of gas retort carbon slightly separated, except at the top, to expose all possible surface. A small plate of carbon extends through the glass cover, and to this a connection screw is firmly affixed.

The negative pole is an amalgamated rod of rolled zinc, the binding post connection at the top of which is a new feature, and a good one.

By setting the glass cover in position, both poles are placed in the jar, in which has been put one half pound of sal ammoniac, and the cell filled to its shoulder with water.

The glass cover, by the aid of a thin band of soft rubber, fits tightly to the jar, making it practically air-tight. The evaporation of the liquid is thus prevented, and there being no waste of material, except when the battery is in actual use, it may be left untouched for many months without loss of power.

We commend this battery to the attention of the telephone companies as worthy, at least, of examination and trial.

The exhibit of the Telephonic Signal Corporation, of New Bedford, Mass., was the Bliss Individual Signal apparatus (patented).

To those familiar with the telephone, no argu-

magnet, from the armature of which extends an arm to trip the catch from the balance-stop and start the clocks.

Binding posts 10 and 11 are the line posts, the two left hand posts being connected with the shunt in the clock, and the outside wires from these posts are to be connected one on each side of receiving coils of the magneto bell.

When an electric current from any station is thrown over the line, it passes through the magnet *i* at each station, which attracts the armature, causing the arm *j* to strike the lever *k*, the end of which rests against a stop on the balance-wheel shaft. The balance-wheel having been stopped in a position that strains the hair-spring, the instant the lever is removed from the balance-stop the clock at each station starts, the pointer making one revolution around the dial-plate. The lever *k* is prevented from again engaging the balance-stop for the period of one minute, during which time the one revolution of the pointer is made.

The small lever *y* with spring 8 (Fig. 1) is for the purpose of starting the clocks if from any reason the pointers have stopped out of their proper position, which is directly at the top of the dial.

The divisions of the dial are numbered (see Fig. 2). As the pointer passes into each division

BOX CLOSED.

to ring the bell at that station—the pointer having reached division 4 of the dial.

In the recent exhibit at Chicago, nine of the Bliss clocks were shown in connection with nine magneto call bells in one circuit, and in another circuit ten, in connection with battery call bells.

IN POSITION TO RING STATION 4.

All worked perfectly, and the exhibit attracted much attention.

We are informed that the American Bell Company has recently made arrangements to own or control this invention.

An entirely novel telephone switch-board, invented by Mr. A. G. Snell, and manufactured by Messrs. C. Cowles & Co., of New Haven, Conn., attracted much attention. Mr. G. T. Perkins, Superintendent of the Springfield Telephone Co., explained the working of the new board.

The inventor has endeavored to produce a switch-board that would have neither cords nor plugs, believing that a board having all the parts fixtures in their place can be operated much more rapidly.

The device that has come to be known as the "Snell jack," consists of a lever handle having a curved arm on each side, and pivoted in a stem having a spiral spring and follower, to keep it in an upright position when disengaged from the metal spring whereby the connections

are made. By turning the lever either way, it comes in contact with the spring, making a rubbing connection so much to be desired.

The first cut represents a switch-board made

their place by a wire passing through near the end of each, and between every third or fifth row through the end of a wire post which projects just above the surface of the board. Upon the

tipping up the jacks on the same groove.

The row of Snell jacks in front are for the purpose of grounding the line when at rest and switching in the operator's telephone. The cut shows 1 and 5 circuits as being in use, while all the others are at rest. When a call is received, the operator throws the proper jack from the back spring to the front by one movement, and is ready to talk with the subscriber. After receiving the request for a connection, he throws the jack into an upright position, so as not to ring on the wire on which the call was received while ringing up the party wanted.

The annunciator on the second switch has an

SNELL JACK SWITCH BOARD.

SNELL SWITCH, SHOWING CIRCUITS 1 AND 5 IN USE.

entirely of the Snell jack. The springs are connected on the back horizontally, and the levers perpendicularly. It is obvious that to connect any two circuits it is only necessary to throw the corresponding levers on the same row of springs.

The second cut represents a switch having as many rows of jacks as may be desired, held in

under side of the wire post is a spiral spring which keeps the wire drawn firmly down on the surface of the board, at the same time allowing the post to give a little in order to keep the jack firmly in its place when tipped up to make a connection on the brass plate on the bottom of the groove. Any two circuits are connected by

ANNUNCIATOR, WITH RECORDING ATTACHMENT.

attachment for recording the number of calls received on each line. It is simple and positive in its working. We show a full-sized cut which needs no explanation.

A new and valuable addition to the many telephone exchange switches was exhibited by the Utica Fire Alarm Telegraph Co. It is known as the Universal Section Switch, with Palmer's patent circular spring-jack. Objection has been made to the old style of spring-jack, that the spring became weak from use and wear, often leaving the line open at the contact points; also that small particles of dust, accidentally finding their way between the points, caused the same result.

In the Palmer spring-jack, which is mechanically a neat and handsome piece of work, these objections are removed, the spring and contact points being inclosed in a case, into which dust cannot find entrance. The contact points make a rubbing contact, and therefore clean themselves, insuring perfect electrical contact, and the spring used being a spiral spring—instead of a straight or flat spring, as before—and of the best steel wire, and so arranged that its full power is always exerted, a perfect mechanical contact is also obtained.

A considerable advantage is gained in the arrangement of the parts so as to prevent the great annoyance found in many other systems, caused by the plug dropping out by accident after connection has been made. The plug when in this jack remains, and is firmly held in place until removed by the operator.

The annunciator drop is of elegant appearance, combining lightness with strength, and has met with much favor in telephone exchanges throughout the country. The combination of these annunciators, spring-jacks and connection strips, in sections of 25, makes a complete and tasteful switch-board.

We regret that the cuts by which we intended to illustrate the prominent features of the Utica company's exhibit could not be completed in time for this issue.

The Gilliland Electric Manufacturing Company, of Indianapolis, is the largest establishment in the world making an exclusive specialty of telephonic apparatus. During the month of March, 1881, they report having paid royalty on 1,905 bells. Their exhibit included the Gilliland standard switch board, of which we give a cut, and which is in use in exchanges in Boston, Chicago, Philadelphia, St. Louis, New Orleans, Milwaukee and in many other cities, both in America and Europe. They also exhibited the Gilliland magneto bells, with and without the secrecy switch, and the new No. 2 bell, for shorter lines. For the Gilliland secrecy switch it

is claimed that it has many advantages over the old styles.

It can be attached to any of their magneto bells by a change in the connections and the addition of the indicator, for in their construction this change was provided for. In all the secrecy switches heretofore made, it was necessary to turn the switch every time it was used, but with this latest improved the gravity switch is employed.

The indicator controls the talking, and when set for the exchange, no further attention is required until it is desired to talk in the opposite direction. When the telephone is hung up, the line is restored for the use of others upon the same circuit. The indicator simply governs the talking.

An improved desk battery box, the lid and front of which, working on hinges, may be opened

Anti-induction aerial cables of small size, with 50 conductors, insulated with cotton paraffine and rubber were shown, as were lead covered cables and other aerial, underground and house cables. The switch cordage and telephone cords made by this manufacturer are well known. The Sawyer patent supporter for telephone cords reduces breakage to a minimum.

A bell manufactured by Messrs. Davis & Watts, of Baltimore, attracted some attention. The feature of this bell is the use of hard brass tooth gearing, which is nearly noiseless, and is claimed to be the best means of transmitting power extant. The same firm also make a bell which works by means of an improved plan of friction gearing, for those who prefer it.

Mr. C. B. Hotchkiss exhibited A. G. Day's

THE GILLILAND STANDARD SWITCH BOARD.

and the battery exposed to view and easy of access, a new and convenient window connection, the ground clamp, the extension bell, the power generator, the pony battery—a small and cheap gravity battery—designed to be used with transmitters alone, were exhibited, and attracted attention.

This company claims originality in all the following improvements, most of which are now in general use, viz.:

The small and compact bell box.

The base board with connections run for transmitters.

The base board, desk and battery box.

The Gilliland form of generator.

The Gilliland noiseless metal gear, designed to supersede the noisy cog-wheel and rubber band.

Exterior bell adjusters.

Hinged door for easy access to apparatus.

The Gilliland improved lock and key.

Power generator, and many others of importance.

An interesting exhibit of insulated copper wire in all sizes, and with all colors and combinations of colors of braided insulation, was made by Eugene F. Phillips, of Providence, R. I.

Special claims of purity of the copper and of care in manufacture are made for this wire.

Anti-induction aerial cables of small size, with 50 conductors, insulated with cotton paraffine and rubber were shown, as were lead covered cables and other aerial, underground and house cables. The switch cordage and telephone cords made by this manufacturer are well known. The Sawyer patent supporter for telephone cords reduces breakage to a minimum.

A bell manufactured by Messrs. Davis & Watts, of Baltimore, attracted some attention. The feature of this bell is the use of hard brass tooth gearing, which is nearly noiseless, and is claimed to be the best means of transmitting power extant. The same firm also make a bell which works by means of an improved plan of friction gearing, for those who prefer it.

Mr. C. B. Hotchkiss exhibited A. G. Day's

completed, making a through connection from that city to Boston by way of New York, and western extensions on a large scale were contemplated. On May 2, \$1,500,000 bonds out of a total issue of \$5,000,000, will be offered for subscription.

#### Answers to Correspondents.

For a line about twelve miles long, with 22 offices attached, of what resistance should the main line relays and local sounders be? They are using relays and sounders both of the same resistance, 20 ohms, which I know is wrong, especially the local. If you will please instruct me through THE OPERATOR you will confer a great favor.

E. W. T.

To provide a satisfactory working circuit in wet as well as dry weather, the relays should measure about 50 ohms; sounders in local circuit to equal the resistance of the local battery and connecting wires.

In the issue of THE OPERATOR of 1st inst., in "A Simple Experiment," by I. H. Farnham, he says: "To reduce its resistance one-half." According to Ohm's law, the arrangement, as illustrated would, in the change of connections, reduce the resistance of the electro-magnet to one-fourth of the resistance in "usual form." Am I correct?

S. J. M. B.

You are. It should have been to one-fourth the resistance, and not one-half. The large number who have drawn our attention to this error shows how thoroughly THE OPERATOR is read.

#### A New Topic for some of the Employees who Got "Left."

How long will it be before a lot of competent men, working cheerfully and constantly, can build up a lively opposition, and how long will it be before those who didn't get "left" this time will be called upon to submit to another salary-grade?

Milwaukee Melange.

#### To the Editor of The Operator:

Chief Barker is again on duty, after an absence of several weeks. The Milwaukee District Telegraph Company has removed from Michigan street to 64 Wisconsin street, a much better location. Mr. W. J. Burns, quondam night-report operator (N. W.), has been succeeded by Mr. H. P. Gifford, of the Board of Trade telegraph. Mr. E. G. Toombs (W. U.) is succeeded by Mr. Ed. McRavey, well known in Milwaukee telegraphic circles. A recent addition to the northwestern day force is Mr. R. E. Looby, of St. Paul. Messrs. Arthur Allen, of Appleton, and G. W. Anderson, of this city, have been working each others' "tricks" the past week. Mr. Allen was formerly employed here on the N. W. force, among whose members he has many friends. In our last communication we neglected to mention the return of Mr. F. G. Palmer from Madison, where he had been "rushing" during the recent session of the legislature.

Mr. J. R. Calder, representing THE OPERATOR, recently paid us a visit, prior to his departure for the Southwest. His trip is yielding a fruitful harvest in this propinquity. While here Mr. Calder suggested the feasibility of a telegraphers' excursion to New York, from this part of the country. Round-trip tickets at reduced rates can easily be secured and a fine time result. Operators here generally favor the idea, and hope it will be carried to a successful issue.

OCTOPUS.

Mr. David Brooks' system of insulation has been tried successfully between Waterloo and Nine Elms Station, on the London and South Western Railway. The London *Electrician*, referring to the experiment, which was made with thirty wires in a tube, for one year, adds: "Encouraged by this success the government is about to extend the system from Nine Elms to Queen's Road Station with thirty wires in a tube, and from Queen's Road to Clapham with forty wires in a tube."

popular kerite wire and cables, including anti-induction telephone cables in which each conductor, after being insulated with kerite, is wrapped with tin-foil.

#### The Mutual Union Company.

The directors of the new Mutual Union Telegraph Company held a meeting last week, at which it was resolved to fix the capital stock of the company at \$10,000,000. The line from Boston, by way of Providence, New Haven and New York, has just been completed. Six wires have been put up, and the poles have a capacity for thirty wires. It was also decided by the Board to extend the line from Boston by way of Worcester, Springfield, Albany, Rochester, Buffalo, Cleveland, Toledo, Chicago, Milwaukee, St. Paul, Minneapolis, Kansas City, St. Louis, Indianapolis, Louisville, Cincinnati, Columbus and Pittsburgh. The points mentioned in this list, it has been estimated, control about nine-tenths of the telegraph business of the country.

The company's line to Washington has been

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, MAY 1, 1881.

Americans visiting Europe will find THE OPERATOR on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

## NOTICE.

MR. J. H. GREEN, manager of THE OPERATOR Branch Office at 84 and 86 La Salle street, Chicago, will keep his office open evenings from 7.30 to 8.30, in order that operators engaged during the day may call and examine our publications and become acquainted. Mr. Green devotes his entire time to THE OPERATOR and our books, and we hope the friends of the paper in Chicago and vicinity will give him all the assistance they can in his efforts to work up a large circulation in that vicinity. Subscription from the West sent to Mr. Green will receive prompt attention.

## QUALITIES NECESSARY TO SUCCESS.

It must now have become plain to even the most sanguine and confiding that there is little to hope for from telegraphic corporations beyond what we actually earn. It has heretofore been one of our greatest weaknesses to look toward our employers as, in a measure, guardians of our personal interests, and to believe that after a certain number of years had elapsed and a given number of battles had been fought and won together, they would, so to speak, "look out" for us in a paternal sort of way. It seems apparent now that this was a mistake; and, moreover, while it would be very agreeable to us, and perhaps better for both sides, morally and financially, to have such a dream realized, it is not necessary that it should be so. The consolidated company seems to be in the market to make money—a very commendable but unpoetical occupation. It seems disposed, on the principle—good again—that there is "no friendship in trade," to buy your services as cheaply as it can, or to sell itself to you, or Vanderbilt, or anybody else, body and s—but it has no soul—if a favorable price be offered. With this view of the case it behooves every man to make himself valuable—indispensable, possibly—and this can be done only by hard study and eternal vigilance. Many worthy operators have already become still worthier doctors, lawyers, dentists and commercial men, while not less than half a dozen knights of the key are millionaires to-day. There is no use in kicking against the inevitable while the time can be better spent in solid work. Every operator should not only qualify himself to do his allotted work well, but he should also qualify himself for the position next ahead; and, even if he is never called to fill it, the proficiency acquired will not hurt him. Some men say that, as there are so many in the business, it is almost useless to expect advancement. The fallacy of this kind of reasoning is best illustrated by a

marine incident. A few years ago an American ocean steamer, the Pennsylvania, during a storm in mid-ocean, had her captain (Captain Bradbury) and the three officers next below him swept off the bridge by one wave and drowned. The fourth officer—a very young man, who had doubtless reasoned that it would be twenty years at least before the company asked him to command a ship, and he had accordingly neglected his nautical education—was thus placed in command. He knew he was on the Atlantic, but his peculiar method of logarithms indicated that the ship was about Memphis, Tennessee, and so he became bewildered. Under these circumstances, the passengers organized a mild kind of mutiny, deposed the officer, offered the captaincy to the cook—who, unfortunately, was also incompetent—and the vessel was finally brought safely to port by one of the passengers. Thus, our young officer, who never expected to be suddenly called ahead, lost a splendid opportunity. This has been the secret of the success of those who have pushed themselves forward in the telegraph business. They were always ready to take hold, and when called upon to perform any delicate and onerous task, they were "there" every time. Such qualifications can only be acquired by hard study, doggedly persevered in. For any one who chooses to read the handwriting on the wall, it is now high time not to expect rewards which are not earned, or favorable consideration on account of past services; but to work cheerfully and faithfully, to keep prepared to accept something better, and, above all, to save money.

THE NEW YORK ELECTRICAL SOCIETY is already giving symptoms of remarkable vigor. Although organized less than three months ago, it has perfected arrangements for bringing before the electrical profession and scientific public of New York the world-famed experiments of Sir William Crookes, showing with great brilliancy and effect the fourth condition of matter. Until the discovery of Professor Crookes it had become settled that matter was found invariably under three conditions, namely, the solid, liquid and gaseous, but now we are made aware of another condition, acting under entirely different laws. It is denominated a radiant energy, inasmuch as wheels are revolved and bodies moved up an inclined plane in vacuums infinitely greater than any hitherto obtained by the effects of light. Prof. H. S. Carhart, from the Northwestern University of Illinois, is well known as one of the ablest experimenters in this country. He has obtained, especially for the purpose of these demonstrations, a lot of apparatus directly from Sir Wm. Crookes' manufacturers. It is highly important that all telegraphers should familiarize themselves with the subject of Professor Carhart's lecture, as the fourth state of matter underlies the marvelous photophone of Professor Bell, Sir Wm. Crookes' radiometer, and other recent important inventions and discoveries. The lecture will take place on the next regular meeting night of the society, Thursday, May 5, at 8 P. M. It will be mainly illustrated with lantern projections, mingled with dazzling effects of the Rhumkorff coil. Two thousand complimentary tickets are to be issued by the Executive Committee of the society, each member being supplied with five for the use of himself and friends. There will be no reserved seats. The main hall of Cooper Union has been secured for the occasion. The surplus of tickets is to be distributed among eminent scientists in and around New York. The society can well afford

to make its début under such favorable circumstances, even at a considerable tax upon its treasury, as the effect of the lecture will be to attract many prominent persons to the society, and the managers of Cooper Union will realize the fact that their fostering care over the infant society is not in vain. Any of our readers or others who desire to attend the lecture, but have not received tickets, or members who may wish additional tickets, can obtain the same free by applying either to the executive committee, of which Mr. F. W. Jones, electrician's department, Western Union building, is chairman, or to this office. We hope to publish a full report of the lecture, with illustrations, in next issue of THE OPERATOR.

OUR professional brethren in England have our earnest sympathy in the dignified but energetic manner in which they are pushing their claims for consideration with the Post-office Department. The department has from the first discriminated, both in the matter of salary and privileges against "telegraphists," and in favor of postal clerks—"sorters" and others. The agitation for reform has been carried on with coolness but admirable firmness, of which we, as brother telegraphers, feel proud. There has been no disposition to resort to extraordinary measures, although the course of Postmaster-General Fawcett has not been uniformly such as to encourage harmony. At a recent conference between the Postmaster-General and a delegation of telegraphists there was present on behalf of the government only one man, Mr. Fischer, from the telegraph department. The operators complain, very properly, that at that interview the gentlemen most competent to deal with matters connected with the telegraph service—namely, Messrs. Graves (Engineer-in-Chief), Preece (Electrician), and Baines (Surveyor-General of Telegraphs), who, in common with the superintendents of the large offices, have had between 20 and 30 years' telegraphic experience, were not called to give evidence. Since then the Postmaster-General has promised to "consider" the case. Our professional brethren merit success, even if only for the dignity and moderation with which they have urged their claims, and if Mr. Fawcett's reputation for fairness and intelligence is well founded, they will meet with success. The department during the past year made a profit of £354,030—equal to a dividend of 3.36 per cent., and there is no just reason why a portion of the profit should not be paid to the operators, who have always been underpaid.

WE notice in some of the large cities a disposition on the part of the consolidated companies to employ women in places involuntarily vacated by male clerks or operators. Equity and common sense demand that men shall not deny to the weaker sex the means of earning an independent livelihood; but equity and common sense also demand that these women shall be paid for similar work something like the salaries which have been paid heretofore to male employés. Equity and common sense, however, never get much of a show when economy and greed get fairly to work, so that there is already noticeable a woful disparity in the salaries paid to male and female, for similar work, which in an equitable sense is altogether unjustifiable. It is certainly a clever stroke of business to discharge some male employé, after getting, perhaps, 20 years' service out of his old bones, when you can pick up some decayed or poverty-stricken gentlewoman for half the salary. She won't do as much work, probably, nor will she work half so

well, but her salary looks nice on the pay-roll. When Hood cried, "Oh, for the rarity of Christian charity," he had no idea that the world, in its revolutions, had to go still further back—back to the ancient customs of the Huns and Goths, and that the "Do unto others" doctrine should be supplanted by the wolfish creed of "they should take who have the power, and they should keep who can." This, if persisted in, must result ultimately in a Falstaffian army of cheap telegraphers, and if they shall miss wrecking the concern it will be more by good luck than good management.

MRS. SARAH BISHOP, widow of the late Samuel C. Bishop, died at her residence, 71 Union place, this city, on Friday, March 18, after a lingering illness of over three years. Her remains were taken on the following Tuesday to Boston for interment in the burial plot in Auburn Cemetery. Upon the sudden death of her husband, which occurred on July 4, 1872, from prostration by heat, Mrs. Bishop became sole proprietor of the extensive manufactory known as the Bishop Gutta Percha Works, of 420 to 426 East Twenty-fifth street, manufacturers of gutta percha insulated telegraph cables, electrical wires, and every variety of pure gutta percha goods. Since 1872 the entire business has been under the personal supervision and management of Mr. W. W. Marks, a valued and thoroughly experienced superintendent, who became connected with the business at its inception in 1847, and whose position as superintendent and general manager, those who have dealings with the Bishop Gutta Percha Works will be glad to know, will not be affected by the death of Mrs. Bishop.

IN making our readers acquainted with each other, and with the history, habits and personality of the most worthy, through the medium of Our National Portrait Gallery, we have endeavored to proceed not only geographically, East, West and South, but at the same time to select only the best men in all directions, of whom, and the zest and worth concentrated within them, we can never know too much. The Pacific Coast has some of the most intellectual men and expert operators in the business, and we know of none more worthy than the quiet, unobtrusive young man at Los Angeles, John Calvin Sherer, whose picture we reproduce to-day. Mr. Sherer is also well known in the East, and his amiable behavior and uniformly good work have left an enduring impression here. There are more of that class of men out there—the Golden Land which boasts such telegraphers as Sabine, Rae, John Leatch, William Leahy and "Bob" Hamilton—so that we have not yet got through with California.

HERE is an historical lesson in economy which some of our managers, who through fright or mistaken zeal are trying to hire very "cheap" men, might paste in their hats for reference, and, for the matter of that, it might pay the executive officers to have an eye on them all around. In 1875, the Automatic Fire Alarm Company, in this city, reduced its operators' salaries at one fell sweep from \$75 to \$50 per month. Nearly all the competent men left at once, but one operator in particular remained as "Superintendent," at a salary \$3 less than he had previously received as an operator. The company was then on probation with regard to the public, and up to that time had done remarkably well. The "cheap" men plugged along for a while, but in

a few months the Waltham Building in Bond street, a structure rigged throughout with the company's apparatus, was burned, with a loss of two million dollars.

PROFESSOR JOSEPH HENRY died at Washington, D. C., Monday, May 13, 1878, consequently next Thursday week will be the third anniversary of his death. In him we lost one of those altruistic characters so rare nowadays—a man who devoted his days entirely to the good of his fellow man, and who, in all his long life of eighty-one years, never engaged in an enterprise which was to put a dollar in his own pocket. It was he who made the telegraph, as it is now operated, a possibility, a fact which was duly emphasized by President Garfield (then a Representative in Congress) at the Morse Memorial meeting in the House of Representatives in 1872. Congress has already commissioned Story to execute a memorial statue of Professor Henry, and it would be a fitting thing for the telegraphers to take some part in thus perpetuating the memory of one whose life was so pure, and whose work was so grand and enduring.

THE American District seems to be applying the same ruffianly tactics in this city to break down its lively opponent, the Mutual District, as were applied by others well known to break down the American Union in New Jersey. When telegraphic competition comes down to hiring gangs of desperadoes to destroy property, or to beat the employes on either side, it is high time that some of the so-called "managers" should be put to making shoes, or some other useful occupation, in the penitentiary. It is only a grade lower than throwing bombs into the open doors of the opposition shop. And yet these saintly men, who order and have ordered such rascally proceedings, are the very people who were so terribly shocked when the common operators indulged in an orderly strike without devastating other people's property.

It was the late William Orton, who, in his official capacity as President of the Western Union Telegraph Company, solemnly assured a committee of Congress that, owing to the peculiar strain placed upon the nerves of telegraph operators, six hours per day of steady telegraphing was about all that an ordinary man could stand and keep his health. If this showing be correct, there must be something radically wrong with our correspondent "Tired" and his companion—who is, doubtless, equally tired—who keep a busy office going from 7.30 A. M. until 2 A. M., and even later.

FROM European papers just to hand it appears that the gross amount received in respect of the British Post-office Telegraph service in eleven years, from 1870 to March 31, 1881, is £11,592,160 18s. 3d., and the gross amount expended is £9,920,597 9s. 7½d., which leaves, to meet interest on stock created on account of the telegraph service and the redemption of debt, a balance of £1,671,563 8s. 7½d. The capital account now amounts to £10,529,577 (about \$52,000,000).

WITH regard to that ten-pound note "endowed with speech," belonging to one of our English readers, and our remark that, when discussing the opposite side of the question, there are any number of American fifty-dollar bills equally loquacious, a number of our readers have testified that, while English ten-pound notes may be endowed with speech, American fifty-dollar bills are "endowed with wings," in all of which

they are speaking from personal knowledge.

OUR esteemed scientific contemporary of London, *The Electrician*, in its issue of the 2d ult., bore evidence of its well-merited success by appearing in enlarged form. *The Electrician* is a model journal of electrical science. It is edited in a careful and scholarly manner, and with its increased facilities for imparting valuable information should prove additionally attractive. To the practical scientist *The Electrician* should be as popular in America as it is in England.

CHICAGO has anticipated the action of other cities in this country by the new rules it has adopted in relation to overhead telegraph wires. An ordinance has been passed forbidding the erection of aerial lines, and requiring all wires now sustained above ground to be put under ground by the 1st of May, 1883. The poles will have to come down in the cities first, and eventually in the country.

PROFESSOR LOOMIS appears still to be experimenting in aerial telegraphy—telegraphing without wires—and it is now said that he proposes to establish communication, through the current which he claims is always found at a great altitude, between one of the highest peaks of the Alps, in Switzerland, and a similarly situated station on the Rocky Mountains, on this continent.

OWING to the floods in the West, and to the fact that the trip has already been longer than was intended, Mr. Calder will not at this time go further West than St. Louis. We have to thank the telegraphers in the various cities Mr. Calder visited for their generous unanimity in swelling his subscribing list, and also superintendents, managers and others in authority for their uniform courtesy and kindness to him.

On the 5th of May, 1861, the first telegraph operator fell a victim to the war. On that morning, D. Brainard Lathrop, serving with the Federal army as a telegraph operator, was entering Yorktown, Va., after its evacuation. He was injured by the explosion of a torpedo and died that afternoon.

NON-SUBSCRIBERS receiving copies of this issue will please understand that our object in sending them is, if possible, to secure their subscriptions for the paper and orders for some of the books we publish. One dollar, in an ordinary letter, properly addressed, will be reasonably certain to reach us. Larger amounts should be registered.

ON Wednesday last President Garfield designated Gen. Anson Stager as a member of the Board of Visitors at West Point. This is a deserved compliment to an old and very popular telegrapher, and reflects credit upon the Administration.

ONE virtue of the electric light, now making such rapid strides toward popularity, will be that no one can be suffocated with it in his bedroom, as is the usual idiot who blows out the gas.

WESTERN UNION stock is quoted at 116½, A. & P. at 46, and American Union at 80. On March 30 they were 113½, 47¼, and American Union not quoted.

THE present number of THE OPERATOR is probably the most elaborately illustrated issue of a telegraphic paper ever published.

THE large amount of interesting matter for this number compels us to issue a 24-page paper.

### Notes and Queries on Electricity and Electro-Magnetism and their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

BY T. D. L.

Q. 112. What is the circuit-breaker, and why is it necessary?

A. In an induction coil, the circuit-breaker is the arrangement applied to the primary wire, which, forming part of the actual circuit, alternately completes and interrupts it. It is generally, in ordinary coils, automatic, or self-acting; for, as previously stated, the soft iron core is often made use of to work the circuit-breaker.

The construction and operation is then as follows: An iron plate, or armature, is fixed to a flat spring, opposite one of the ends of the core, and, when not in operation, it presses against a metallic back-stop, by the elasticity of the spring. The circuit of the battery and primary coil passes through this armature spring and back-stop. For example: Starting from the positive pole of the battery, the path of the current is first to the metallic limit, or back-stop; thence to the armature and spring; then to one of the primary coil terminals, through the coil, and from the other terminal to the negative pole of the battery.

Now, when the battery is connected, to put the coil in operation, the current passes through the primary coil, and causes the core to become magnetic. The armature and spring is then attracted to the core and away from its back limit. This breaks the circuit; the magnetism disappears; the armature falls back, closing the circuit, indefinitely the action, and alternately establishing and breaking the continuity of the primary circuit.

The rapidity of the vibrations is regulated by an adjusting screw. The circuit breaker is sometimes worked by a separate electro-magnet and sometimes by clockwork or other mechanical movements. In one form or another, it is an indispensable adjunct to the induction coil; because, as we have seen, the number of induced currents depend entirely upon the break and close of the primary circuit, and the consequent change of magnetism in the core. If we close the primary circuit once, we merely get one pulsation of current in the secondary coil. If we then open the primary, we again perceive but one pulsation in the secondary coil, but this time in the opposite direction. Hence, if we rapidly break and close the primary circuit, we see there is a correspondent succession of currents in the secondary coil.

Q. 113. Give a brief description of some of the largest induction coils which have been made?

A. The coil made by Ritchie, of Boston, for Mr. Gassiot, is one of the most powerful instruments constructed. The primary coil is of No. 9 wire, Birmingham gauge, and is wound in three layers, the length being one hundred and fifty feet. This coil has a gutta-percha case, over which is placed a glass tube. Over this, again, is arranged the secondary coil, divided into three sections, each five inches long, and wound on glass cylinders. The total length of the secondary wire is 73,650 feet, or nearly fourteen miles, and the core consists of a bundle of soft iron wires; the bundle being eighteen inches long and about an inch and three-quarters in diameter. The contact breaker is worked by a ratchet-wheel turned by hand. This coil has, with five cells of Grove battery, given sparks twelve inches and a quarter long.

Ritchie has since constructed a coil for the Hoboken Institute of Technology, which has a primary coil made of No. 6 wire, and 195 feet long. The core is a bundle of No. 20 iron wires, and the secondary wire is more than fifty miles long, and is made of No. 36 wire. It has, using

three large bichromate cells, given sparks 21 inches in length.

The largest coil made is that of the Polytechnic Institute, London. Its primary coil weighs one hundred and forty-five pounds, and is eleven thousand three hundred and ten feet long, while the secondary wire is one hundred and fifty miles long, weighs six hundred and six pounds, and has a resistance of 33,560 ohms.

The core is a bundle of No. 16 iron wire, and as a whole is five feet long and four inches in diameter. The entire instrument is nine feet ten inches long and two feet in diameter. This coil has given sparks twenty-nine inches in length.

Perhaps, however, the most wonderful machine of this class is that constructed by Mr. Apps, of London, for Mr. Spottiswoode, of the Royal Society. It is capable of producing sparks forty-two inches in length. It has two primary coils, which can be readily substituted for each other. One is intended for the production of long sparks; the other for short and thick sparks.

The secondary coil consists of two hundred and eighty miles of wire. Its resistance is 110,200 ohms; and the total number of convolutions is 341,850. The first primary coil is nine hundred and ninety feet long, has a resistance of two ohms and eight-tenths; consists of thirteen hundred and forty-four turns in six layers, and weighs fifty-five pounds. It has a core consisting of a bundle of iron wires, forming together a core forty-four inches long, upward of three inches and a half thick, and weighing sixty-seven pounds.

Q. 114. What are the uses of the induction coil?

A. It is a valuable agent in chemical and physical research; has been used in mines to furnish electric light in hermetically sealed tubes, and also in the place of the frictional machine to charge leyden jars. It is extensively employed for medical purposes, and has by Siemens and Halske been applied to telegraphy. For gas lighting it has been very useful; and last, but not least, has been successfully adapted to battery telephones.

Q. 115. What proportion should the resistance of an electro-magnet bear to the resistance of the other component parts of the circuit?

A. It is one of the laws of electro-magnetism that with any given battery the greatest magnetic force is obtained when the resistance of the coils of the electro-magnet or magnets is equal to the resistance of the other portions of the circuit; that is, of the batteries and conducting wires. This law holds good practically on short and local circuits; but on long telegraphic circuits it is only applicable when they are perfectly insulated. It is therefore, usual in telegraphic practice to make the total resistance of the electro-magnets considerably less than that of the line, when in good order, so that in bad weather the best results may be obtained.

To illustrate: It is required to ring a bell over a copper wire one hundred feet long, with two cells of Leclanché battery. What should be the resistance of the bell magnet to obtain the greatest magnetic power? The Leclanché cell has an internal resistance of about one ohm; therefore two cells would have a resistance of two ohms, and in this case the conductor, on account of its shortness, may be ignored. The resistance of the bell magnet need be only two ohms, to obtain the best result. The consideration of wire comes in here. Although we have decided that the resistance of the coils should be two ohms, it is still possible to err in the size of wire employed, therefore after ascertaining by the relative resistances of the circuit and the rule already given what the resistance of the electro-magnet should be, we must take care not to use wire that is too fine, or we shall reach the required resistance before the core is sufficiently covered to give much magnetic effect, as with very fine wire it takes very few convolutions to give a resistance of two ohms. It is also essential that we do not use wire that is too coarse; as in that case to reach the proper resistance we have to wind so many layers that, with the exception of the first one or two layers, convolutions are so far away from the core as to lose their influence on it. Wire should always be chosen, therefore, for winding electro-magnets that will reach the required resistance before the last convolution attains a distance of half an inch from the core. Between half-an-inch and three-eighths from the

core is the best distance for the last layer of wire.

We will now suppose a line half a mile long, built of No. 9 iron wire, with two bell magnets in circuit, and a battery of ten cells. The battery resistance is ten ohms, the line resistance about eight ohms; total resistance of line and battery is, then, eighteen ohms. The sum of the electro-magnets should then, likewise, be eighteen ohms, or nine ohms each, to obtain the greatest magnetizing power from the given battery of ten cells.

Q. 116. In constructing an electro-magnet for a very short circuit, what kind of wire should be used, and why?

A. We have seen that the resistance of the electro-magnet coil should be equal to that of the other portions of the circuit. It is, therefore, apparent that to accomplish this in a very short circuit it is necessary to employ a comparatively short, coarse wire; short, because even a very small addition would increase the resistance of the circuit out of all proportion; thick, because the current is not greatly enfeebled by its use, while the number of convolutions it allows of are sufficient to effect a strong magnetization. In short, we use a comparatively thick wire because it is necessary to get the greatest magnetic effect without the weakening of the current consequent on the use of a thin wire, which necessarily is of high resistance.

Q. 117. How should an electro-magnet be made for a very long circuit, or a circuit of very high resistance, and why?

For a long circuit, such as that of a telegraph line, or a circuit which has a high resistance outside of the coil; for instance, in the battery; the magnet must be wound with a very fine, small wire of great length, which will allow of a great number of convolutions being wound over the core without exceeding the distance at which they cease to increase its magnetism. The reason of this is, that in a very long circuit, like a telegraph line, or in a circuit of very high resistance, the current is necessarily very weak and feeble, even though the battery be composed of a large number of cells. The coil is, therefore, made of fine wire, so that a great many convolutions can be used, each one adding its own influence to the combined magnetic effect, while its own resistance (which, considered by itself, is great) is yet so small in proportion to the entire circuit that it does not decrease the strength to any great extent.

The same rule relating to the proper proportionment of the electro-magnet to the circuit holds good in this case. For example, we have a line 200 miles long, of No. 9 wire, and a battery of eighty Callaud cells. We are to have five relays. What should be the resistance of each of those relays?

We call the line wire resistance 16 ohms per mile for 200 miles. Then the line resistance will be 320 ohms. Calling the battery resistance 8 ohms per cell, the resistance of the entire battery will be 240 ohms; giving as the total resistance of line and battery 560 ohms.

Then, following the rule already given, we must make the total resistance of the electro-magnets 560 ohms, also. This, divided by 5, for the number of magnets, gives us as the resistance of each magnet, 112 ohms. In practice, however, as has been already observed, it is well to keep the magnet resistance a little less than that of the line and battery, to allow for variation due to weather. The condensed reason, then, why we use fine wire—and a great deal of it—for circuits of high resistance is, that the high resistance of the circuit greatly enfeebles the current, and we must use fine wire to make the best of the remaining strength of the current by a greatly increased number of convolutions.

### The Haskins Telephone Exchange System.

On the invitation of Mr. C. H. Haskins, a number of delegates, after the adjournment of the Chicago Convention, visited Milwaukee to examine the system in use in the Telephone Exchange there.

The delegates were met at the Milwaukee depot by Mr. H. C. Haskins, who had provided the necessary carriages, and were at once driven to a convenient hotel, where an inviting dinner awaited them. After dinner considerable time

was devoted to examining the Telephone Exchange. A remarkable and admirable feature in this system is the almost entire absence of noise. Except for the business-like rattle of the annunciators on the operating tables when the power generator is momentarily connected, and the low whisper of the operators at the switchboard in talking to subscribers, no sound was heard. All communications between the operators are made by electric signals. Nearly 500 subscribers are connected with this Exchange, and the service is apparently entirely satisfactory to them. Several connections were timed. From the first dropping of the annunciator, when the subscriber calls, until his wants have been ascertained, connection made with the party desired, and the latter called, the time occupied varied from 12 to 25 seconds. No other exchange being in operation at Milwaukee, all the connec-

the Gilliland board. Behind the annunciator board A are the operating tables. These may be placed in another room if desired, as no conversation between the boards and tables is necessary.

The horizontal strips are numbered in pairs, 1, 1, 2, 2, etc., and wires from these strips lead to the tables; so that when two parties are connected, the circuit is through the loops to the tables, and back to the board. A two point switch,  $H$ , is upon the table, for each pair of connecting strips. The lower strip  $F'$ , of the pair, is connected by its wire with the switch  $H$ , after passing through an annunciator drop  $Q$ , while the upper strip is connected to the plate  $J$ . To the other plate,  $K$ , of the switch, is connected the wire  $L$ , from the power generator  $G$ . This wire  $L$ , however, before reaching plate  $K$ , passes through the connecting points  $M$ , of the disconnecting drop  $D$ , so that when the drop  $D$  falls it will break the wire  $L$ , at  $M$ .

The normal position of the switch  $H$  is on plate

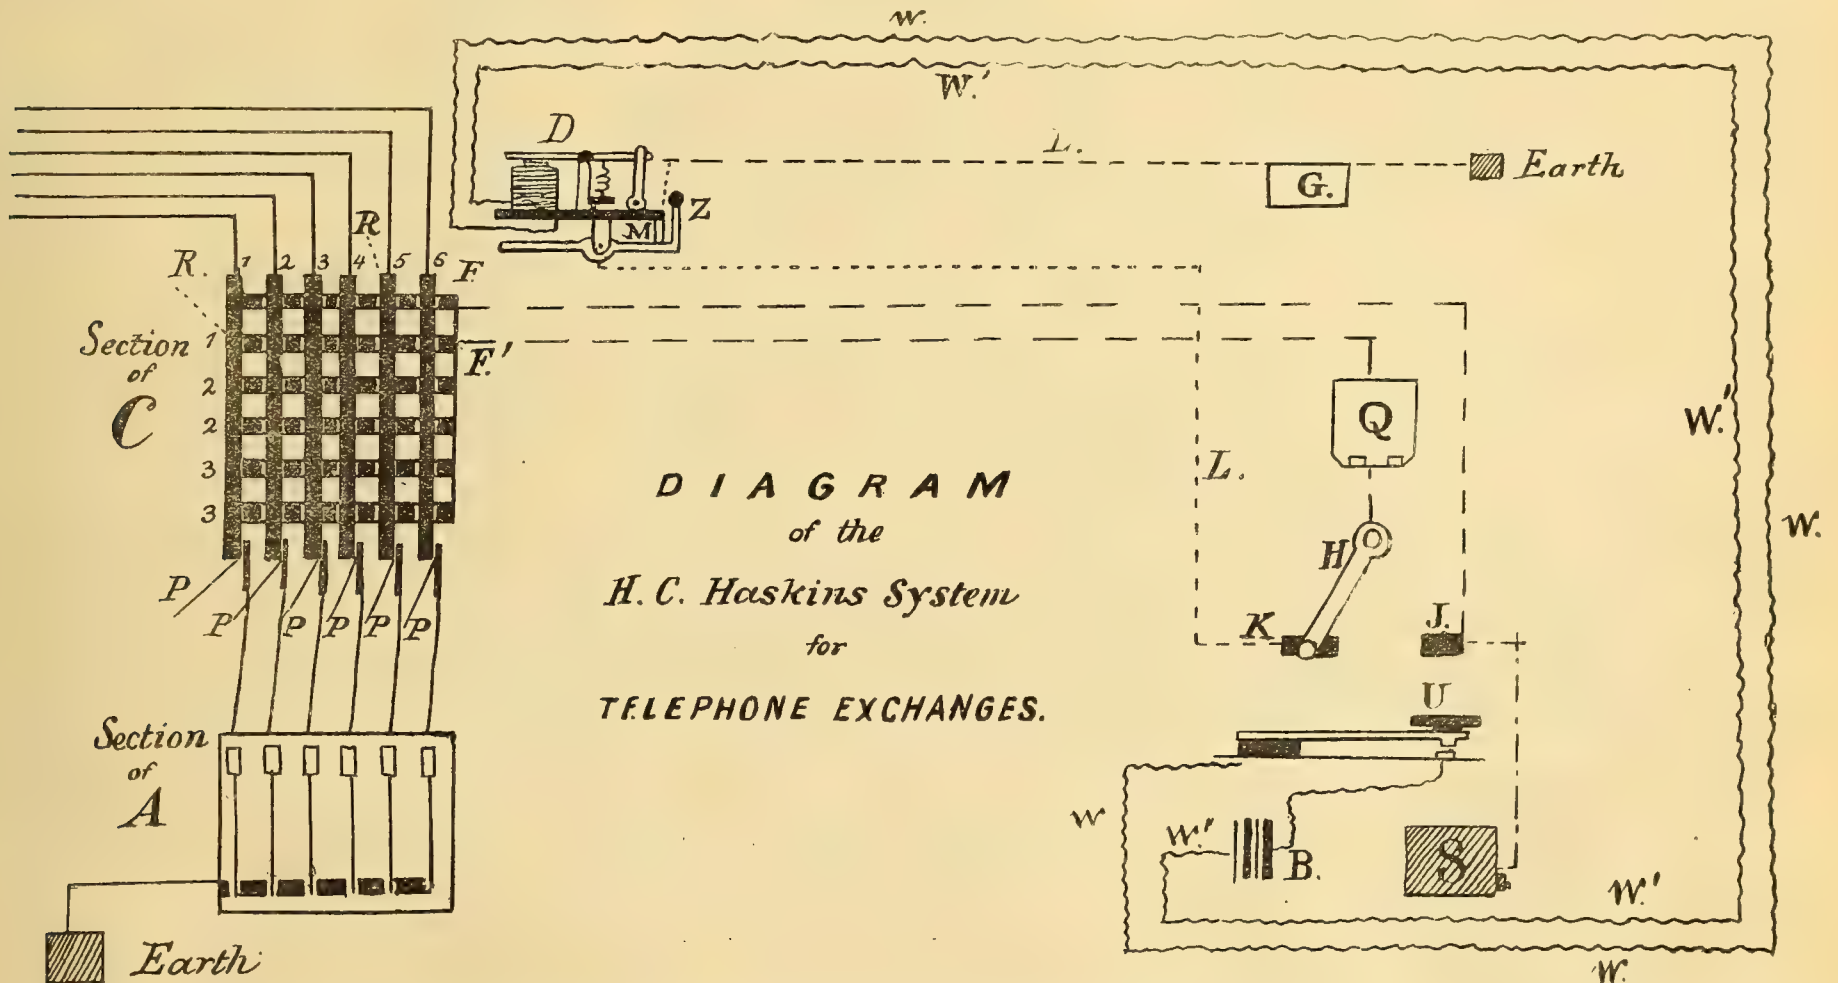

throws the disconnection drop  $D$ , and is a notice to the disconnection operator to remove the plugs from the strips numbered the same as the drop. One such drop is necessary for each pair of connecting strips.

After leaving the telephone exchange the cable boxes in which the Brooks submarine cables are connected were visited, after which the visitors returned to Chicago.

## Pacific Coast Notes.

*To the Editor of The Operator:*

SIR: Somebody sent us a copy of the *Telegram* a few days ago. We had not been warned that a new candidate for the favors of telegraph operators was to be launched upon the sea of literature, and so its appearance was the cause of a sensation of surprise that any more of the many talented men in our "profession" should

tions are, of course, local connections. About 20 per cent. of the lines have more than one station.

The system, as described below in full detail, is a very simple one, and will readily be understood and its advantages appreciated by telephone men.

Three classes of operators are required: Answering operators, to receive the first call of the subscriber, ascertain his wants and make the connection at switch C; table operators, to see that subscribers, when connected, are aware of the fact, and to notify the disconnecting operator when the subscribers have finished. The third class are the disconnection operators, whose duty it is then to remove the connection plugs, and restore the switch to its normal condition.

Two boards are used. All the lines are run to the perpendicular strips of the connecting board C, which are crossed by pairs of horizontal connection strips. The other board, A, on which the annunciators are placed, faces the connection board from five to six feet distant. The boards are of the Gilliland pattern. The course of the line wires is as follows:

From the tower or cupola to the top of the connecting board C, where they are attached to the perpendicular or line strips of the board 1, 2, 3, 4, etc., by a plug inserted below at P, between a line strip and a brass plate, each line strip is connected with a wire which runs to the annunciator board A, thence through the annunciator and by a plug connection to the ground. This is the ordinary path of the line circuit in

K. Thus the lower strip  $F'$  is connected with the generator, and if line 1 is connected by a plug inserted at  $R$ , the generator current will be thrown to that line and ring the subscriber. Hence the party desired is always put in the bottom strip, while the party calling is plugged into the upper strip at  $R'$  of any pair; and the mere insertion of the plug at the junction of a line and the bottom strip of a pair not only rings the party wanted but also drops the annunciator  $Q$  on the table, thus notifying the table operator that a connection is made.

It is evident that unless the switch  $H$  is moved from  $K$ , the generator current will continue to ring the party. Hence the table operator, as soon as the annunciator falls, moves the switch  $H$  to plate  $J$ , and restores the annunciator  $Q$ .

The answering ring of the party called passes through  $Q$ , dropping it again, and thence to the party asking the connection. Thus the answering ring notifies the table operator and the calling party at the same time.

If the first call has not been sufficient, the table operator calls again by moving the switch *H* to plate *K*. Subscribers, when they have finished their conversation, can notify the exchange by "ringing out," which will drop the annunciator *Q*, or the table operator may "listen in" by touching his telephone cord to the plate *S*, which is connected with the switch *C* at the plate *J*; and when subscribers have finished conversation this operator notifies the disconnection operator at switch *C*, by depressing the button *U*, which

rashly venture out into a channel so thickly strewn with wrecks, and upon the bosom of which but one proud bark, yclept THE OPERATOR, sails now in safety. The *Telegram* is a bright, handsome journal, filled with matter of particular and general interest, and the versatile Noble seems to have put a great deal of his best work upon the number we perused, while the other contents are certainly up to any reasonable standard that operators as a class would wish the literature of their profession gauged by. But after the failure of the venture of Messrs. Christie and Phillips, in that direction—or was *The Magnet* struck by official lightning—it really seems to us, looking at the project from a safe distance, that the temerity of this last attempt is unprecedented. At the same time we confess that we admire the courage of the Messrs. Noble, and we hope their inevitable failure won't either diminish their sublime faith (in things in general) nor shake their confidence in their fellow workers; who, for various reasons, do not concur with them in the belief that telegraphers are fairly yearning for another telegraphic paper.

We do not support THE OPERATOR because it is as able or fascinating a journal as any in the

country, nor because it is "the best and cheapest" of the numberless periodicals published in New York City and has a good-looking man for an editor; but because it is everything that we can reasonably demand and has for its editor a man who is not connected in the remotest manner with the "Great Monopoly," and, as a consequence, can and does speak independently upon all subjects connected with our welfare. And we hereby offer a gilt-edged chromo for the production, dead or alive, of any man employed by the Western Union Telegraph Company, or the Associated Press, who can, over his own signature, or in any publication known to be controlled by him, express with impunity or without fear of the consequences opinions such as have been expressed in the columns of THE OPERATOR ever since its inception! There, now! (The Editor of THE OPERATOR pays me "two bits" a line for writing this.) We have doubtless a surplus of brains in the telegraphic fraternity, but we hope that no man, nor any two men, who gives or give nine or ten hours a day to the telegraph company (for a consideration), expects or expect to be able during his or their leisure hours to edit and publish a paper which will serve the same purpose as effectually as does THE OPERATOR.

The telegraphic business of this coast continues to increase steadily in volume; that of the Southern Division, under the supervision of Superintendent Haines, one of the Argonauts of the profession, has about doubled during the past year, owing to the rapid development of the Arizona mining region during that time and now opened up to the outside world by the advent of the Southern Transcontinental Railway. Two Western Union wires (one used by the R. R. Co.) are in operation to Tucson, Arizona, 500 miles east of Los Angeles while the wire used by the Railroad Company extends as far as Deming, New Mexico, 225 miles further east, and a third line is being constructed by the Western Union eastward to Los Angeles from Tucson, now about half completed.

Tombstone, the two-year-old mining "camp," is the liveliest town in the sunburnt Territory, and the "loop" which the company extended to that place from Benson, about a year ago, is proving to be a wonderfully remunerative investment. Messrs. Kingsbury and Emlay are the operators there. Mr. Bowker has resigned his position as Manager of the Western Union offices at Tucson, and an impression prevails that he has "found something better." He is succeeded by Mr. Kearon, formerly of Sacramento, with Mr. Donnelly as a very efficient assistant. By Mr. Bowker's retirement from its service, the Western Union has lost a fine operator and one of the most "immediate" and best transmitters of Morse that it was ever the misfortune of a plug to encounter. Mr. Berry, for many years operator in the San Francisco office, has been transferred to Sacramento as chief operator, vice Mr. Frank B. Rue, resigned. The promotion is a well-deserved one and in pleasant contrast with the frequent practice of importing men to fill the best positions here. Mr. Venton, an old employé of the Company lately stationed at Maricopa, Arizona, has resigned to accept the agency of Wells-Fargo's Express Company at Pinal. His numerous friends wish him the success which he will doubtless achieve, and of which very few men can be found in the ranks who are equally deserving. He is superseded by Mr. Hall. The force at the Los Angeles office has been strengthened by the addition to it of Mr. David Allen, from Sacramento. The former office is now one of the busiest on the coast, with the volume of business passing through it increasing daily and all handled without any of the modern inventions, and with no labor-saving apparatus except a "button" repeater.

Telephone business upon the coast is fairly "booming." Bowker, at Tucson; Stewart, at Los Angeles, and Thompson, at San Diego, are all deeply interested in the "Hallo" system of communication, and the public takes kindly to it. In

Los Angeles a local Telephone Company has been incorporated, with G. Q. Stewart as the principal stockholder and manager, and Johnny Beckwith as chief switchman and manipulator of the "Hallo." Mr. Straun, formerly connected with the Bell Telephone Company in San Francisco, is now working in the capacity of telegraph operator for the Southern Pacific Railroad Co., at Tucson, having returned to his first love.

Have you seen the last number of the *Californian*? Among its contents is an interesting article by General Superintendent Gamble, upon the introduction of the telegraph upon the Pacific Coast, being a recital of his personal experiences in locating routes, constructing lines, etc., at a time when California was a trackless wilderness compared with its condition to day, and you and I and the majority of the fraternity had not yet begun to wrestle with the intricacies of the mystic art.

PACIFICUS.

April 8, 1881.

#### Chicago Notes.

To the Editor of The Operator:

SIR: The new Union Depot, Madison and Canal streets, this city, just finished, is a marvel of architectural beauty and good taste, and mammoth in appearance. It takes in the following railroads: C. & A., C., B. & Q., Panhandle, Chi., Mil. & St. Paul, and the Chicago & Northwestern. In this building is located the Union Telegraph office, accommodating the different wires of the above named roads. It is one of the finest offices in the West, and is fitted up with entirely new furniture and fixtures. The instruments, twenty in all, are of the latest and most approved pattern, and heavily nickel plated. They were made by the Western Electrical Manufacturing Company, of Chicago, and said to be a set of the most admirable sent out. The switch-board is a beauty, set in an elegantly carved and veneered black walnut case. The office is under the management of the well-known and experienced telegrapher, Mr. L. J. Mundt, with Mr. Will P. Ingram as chief operator, and D. L. Shine assistant. Two more operators are shortly to be added to the force. The C. & N. W. Railway have just moved their train dispatcher's office into their new building, a splendid structure, handsomely fitted up, a real ornament to our city. The train dispatcher's office is being furnished with new instruments, and is presided over by Mr. Otto Miller, one of the "old-timers" of the West, and an excellent dispatcher.

Western Union notes: Business booming. Arrivals: O. M. Stone, late manager A. & P., at the board; Mr. Lathrop, A. U., from South Water street, and Mr. Edward Foote, A. & P. Resigned: J. Dyer and C. Coarser, gone to St. Paul; John O'Brien with W. T. Barker, broker, (city private wire); F. Randolph with A. O. Slaughter, broker, in same capacity.

Many old operators think that Col. Wilson, late Superintendent should not have been allowed to take his departure without a suitable testimonial in recognition of his proverbial friendliness and good will to them. Their best wishes follow him.

There is a rumor current that the new officials here contemplate adding an hour to the time constituting a "day's work" on the night force, which, of course, would be equivalent to a reduction of salary and cause the hours of the night toilers to drag more wearily than ever. We earnestly hope that the rumor will not turn out to be true. There are various reasons why such action would, in the opinion of your correspondent, be impolitic, as, in the long run, bringing little or no profit to the company. True economy of labor must necessarily be in harmony with due economy of health and of life. The pale, wan faces, the sleepless-looking eyes, and the nerveless hands of the great number of the night workers, record too plainly that the price paid for their struggles and violations against the laws of nature must be, at least, a corresponding shortening of existence, and in many cases that we can recall to mind, there have thus been hastenings away forever of friends who ought to be with us now. The imposing of fresh and painful burdens upon employes, at a time of the company's unexampled prosperity, must prove, sooner or later—to put it mildly—measures of very doubtful expediency.

The late alliances and changes have brought

trying ordeals to numerous of the faithful and unfaithful all over the land. They yet inherit a future, and the events of the present must gradually rule the destinies that are to checker that future for better or for worse. *Nous Verrons.*

CHICAGO, April 25, 1881.

Respectfully Referred to the New Management.

To the Editor of The Operator:

SIR: Kindly answer this: Do you know of any telegraphic station in the country, or in any other country, that is run by two operators—one relieving the other—that is kept open from 7.30 A. M. until 2 A. M., and even later, handling two hundred commercial messages and Associated Press dispatches, besides receiving and transmitting from 1,000 to 4,500 words of "specials," with no clerk to assist on the books, counter work, etc.? Do you think it possible for two men to do such work and keep their health? What is considered a day operator's work, and a night operator's work, in hours? TIRED.

#### TELEPHONE DEPARTMENT.

Hello, exchange, please give me Jones;  
Hello, hello—o, hello—o—o!  
Oh! there you are, these telephones  
Do bother people so.

I'll call, my dear; hello, hello—o,  
I say I'll call at nine;  
I'm so in haste, sweet one—hello,  
Hello—o—o—to call you mine.

I wait—hello—impatiently,  
Hello, hello—o—the day  
When our fond souls shall melt in one—  
Hello! what's that you say?

What crack-brained fool is't telephones?  
Why, precious, I am Dan—  
Hello—you say you're Deacon Smith?  
Good Lord! not Mary Ann?

The polite young man now takes off his hat to talk to a lady through the telephone.

Our California correspondent says that the telephone business is "fairly booming" out there.

Bob Ingersoll can't learn the telephone. He says he doesn't believe the first syllable of its vocabulary.

A local telephone company has been inaugurated at Los Angeles, Cal., with Mr. G. Q. Stewart as the manager.

Telephonic communication was recently had between Bangor, Me., and St. John's, New Brunswick, a distance of 214 miles. Every word is said to have been heard distinctly.

The Vicksburg exchange is now connected with the exchange at New Orleans. The distance is 230 miles, and conversation is said to be carried on with much distinctness.

In a paper on the causes of telephonic transmission disturbance, M. GaiFFE, inferentially, condemns the friction of wires with each other and the vibrations caused by winds, etc.

The Bell Telephone Co., of Philadelphia, are fitting up at exchange at Atlantic City, which they expect to have in successful running order before the summer rush to the seaside sets in.

The complete system of telephones in China, commencing north of the Yang Tse Kiang, will be constructed under the supervision of an American telegrapher, Mr. J. A. Betts, who built the telegraph line from Tientsin to Taku.

*L'Electricité* says that the Telephone Company in Belgium has inaugurated a very ingenious and at the same time practical system. Subscribers can, by leaving word the previous evening, be awakened at any hour in the morning by means of a powerful alarm.

The Consolidated Telephone Construction and Maintenance Company (limited) is the title of a new company, intended to harmonize the hitherto conflicting interests of the United Telephone Company and the Gower-Bell Telephone Company. The capital is to be £300,000, in £1 shares, of which the first issue is to be £200,000.—*Telegraphic Journal.*

The difficulties which have hitherto prevented the United Telephone Company, of London, from extending their exchange system over the whole metropolis, owing to the Post-office monopoly have now been removed and the Post-office has

granted a license to the company to erect telephone exchanges, they paying the Post-office an annual royalty of 10 per cent. on the subscriptions received.

Telephone matters at Milwaukee are in a prosperous condition. Superintendent Kelsey informs us that the Exchange now numbers 650 subscribers, and applications are constantly being received without solicitation on the part of the telephone managers. One of their cables at the Oneida street bridge, containing fifty wires, was broken by the spring freshets recently, but was repaired and in working order two days later. The break was occasioned by the guy wires giving way, bringing the entire strain upon the cable.

Mr. C. W. Ross, Vice-President of the Columbus Telephone Company, who at the recent telephone convention advocated the use of No. 14 steel wire for telephone lines, writes: "I notice the last *Journal of the Telegraph* says editorially that it was agreed at the telephone convention that the adoption of steel wire for all telephone lines of a mile or less was advisable, but not for lines of a greater distance. The contrary was the fact, it being universally conceded that resistance might be entirely left out of the question, excepting so far as it affected signaling. This limit would not be reached inside of ten miles."

The value of the telephone is well illustrated by a recent incident which occurred in Chicago. At present, owing to the consolidation, the company is unable to put in telephones as fast as customers want them, and many are offering a premium for the use of the instruments. A tugman who had just gone into business, finding that he could not be supplied, made an offer of \$1,000 for one, and was delighted when a party, abandoning the use of his instrument, made it over to him. He acknowledged that the absence of the telephone would cost him thousands of dollars annually; in fact, he could not get along without it.

In last issue of THE OPERATOR, mention was made of the Chinnock anti-induction telephone cables. The cables referred to were all manufactured by the Bishop Gutta Percha Works, of this city. One, a ten conductor, gutta percha insulation, each conductor wrapped with sheeted lead—the manner of putting the same on being original with Supt. Marks, of the Gutta Percha Works—and the whole constructed similar to submarine cables, was laid in the North River. Other anti-induction cables made on the air-line style, manufactured in accordance with Mr. Chinnock's idea by the Bishop Gutta Percha Works, were successfully laid over a year ago, and are working perfectly at the present time.

The idea of a telephone from one's house to the church seems to be gathering popularity. Recently the President of the Telephone Exchange of Carrollton, Ill., ran a line into the Presbyterian church, connecting it with a Blake transmitter placed at the right of the speaker in the pulpit, and on the 11th ult. the citizens at a dozen residences and business places, some of them a half mile distant, listened to the sermons by the pastor. Every word of the two discourses was heard as distinctly as though the listeners were in the church. The music was particularly clear and distinct, the voices of the different choristers being readily distinguished. In Scotland, a similar experiment has been quite successful. An invalid gentleman in Edinburgh, who is a member of a United Presbyterian congregation, but has been unable from illness to attend the services of the church with which he has been associated as an elder for twelve years, has established telephonic communication between his house and the church in question. "Sounding chambers" are placed on either side of the pulpit through which the voice of the preacher is conveyed, while by means of another chamber in the gallery the singing of the choir and congregation is transmitted. The sounds alike of preaching and worship, although traveling over three miles of wire, are, it is stated, distinctly heard, not a word being missed.

The Chicago Common Council has passed an ordinance, which, carried out, promises to give serious trouble to telegraph and telephone companies in that city. One clause of the ordinance reads as follows:

"No person shall hereafter erect, construct, or put up, any telegraph pole, telegraph line, or

wire, or electric conductor, in any street, avenue, or alley, within the corporate limits of the city of Chicago, under the penalty of \$100 for each and every offense. And each and every day any such telegraph pole, line or wire, or electric conductor shall be continued and maintained after the first conviction shall constitute a new and separate offense."

Telephone men in that city say that this would put an end to the growth of the telephone system in Chicago, and would give the present patrons of the telephone companies a monopoly which would prove disastrous to their competitors in business. Between 300 and 400 applications are on hand from parties desiring telephones, which cannot be filled until the wires can be run into the consolidated offices, as otherwise the wires would have to be twice built. No further work in the way of consolidating the offices of the companies could be done after May 1, if the ordinance remained in force, as it would be an utter impossibility to place the wires under ground at so short notice.

## DASHES HERE AND THERE.

Electric illuminations will be resumed at Niagara in May.

The number of telegrams sent in Italy in 1880 was 26,332,579, being 2,398,824 more than in 1879.

The employment of tricycles for the use of telegraph messengers in New South Wales is being instituted.

The Mexican Government now owns and operates about 11,000 miles of wire radiating from the City of Mexico.

The message read: "Can't come to-day. Just quit sawing on that bill," but was received: "Can't come to-day. Just swing onto that bill."

A Philadelphia man tried the electric-kiss experiment with a science-loving young lady. The current was so strong that even the man's wife was shocked.—*News*.

It is again proposed that the flash of the lantern in every light-house shall indicate, by long and short flashes, on the principle of the Morse alphabet, the name of the particular light-house.

A St. Louis paper explains that the words "too boozy to give information," which it had applied to the night operator at the Union depot telegraph office, should have been "too busy," &c.

In referring to the advertisement of Mr. H. L. Bonsteel, in last issue, we said Mr. Bonsteel was manager of the Newark, N. Y., office, it should have been New Haven, N. Y., as the advertisement reads.

*Punch* admonishes Postmaster-General Fawcett as follows: "Will the telegraph clerks and employés be compelled to strike? They have addressed themselves to the Postmaster-General, and said 'Don't Force it!'"

George Wallace, the telegraph operator at Newport, Arkansas, and James Goodloe, a merchant, went out to hunt, with shot-guns, on the 14th ultimo. They had fine fun, during which the telegrapher mistook Goodloe for a turkey, and shot him dead.

The day operators at the Place de la Bourse, Paris, have been replaced by women. Only experienced male "clerks" acquainted with the night duties and press service have been retained at that office. But lots of them hang around there during the day, all the same.

The telegraph authorities of New South Wales now mount their messengers on velocipedes, of the tricycle type, instead of horses or ponies. It is expected that the introduction of this system will save about \$3,000 a year to the department for forage in Sydney alone, without reckoning the cost of saddlery.

A \$20 Breech-loading Shot Gun for \$7. The Champion Imported Breech-loading Shot Gun advertised in this issue by the reliable, well-known firm of E. G. Rideout & Co., New York, is pronounced by sportsmen to be unrivaled in every detail, well worth \$20, and the biggest bargain ever offered in fire-arms. Order at once, as the offer is only good until July 15.

The American Commission to the Paris Electrical Exhibition, as now fully organized, comprises Mr. Robert R. Hitt as Acting Commissioner General, with Messrs. George Walker, George F.

Barker, Captain D. P. Heap, U. S. A.; Lieut. T. C. McLean, U. S. N.; George E. Gourand and Charles R. Goodwin as Commissioners, and Mr. Philip Walker as Secretary to the Commission.

The *Electrician* says that the Newcastle wing of the First Newcastle and Durham Engineer Volunteers underwent a practical test the other day. Among other things, thirty lines of a newspaper column, equal to 240 words, were flashed across the Tyne by means of lamp signals, and read off in thirty minutes. The lamps were the same as used in the army, and this rate is said to be above the average of the regulars.

The Assembly at Albany has passed, 66 to 34, Mr. Spinola's bill for fixing the charges for receiving and delivering telegraph messages of fifteen words or less to any point in this State at not to exceed 20 cents, all dispatches to newspapers to be at one-half this rate. Mr. Niles' bill requiring the trunk lines of telegraph below Forty-second street, in New York City, to be laid under ground, also passed the Assembly—79 to 13.

The Bankers' and Merchants' Telegraph Company has been organized under the laws of the State of New York, with a capital of \$1,000,000, all of which has been subscribed for by active business men in this city, Philadelphia, Baltimore and Boston. The company has begun the construction of a twelve-wire line between Boston and Washington. The projectors say that the line is to be devoted entirely to commercial business.

Messrs. J. H. Bunnell & Co., as a further evidence, if any were necessary, of their enterprise, as well as of their growth and prosperity, have just placed in front of their store at 112 Liberty street, this city, a handsome double-decked show-case, filled with all kinds of telegraphic, telephonic and electrical instruments and apparatus, which attracts much attention from passers-by, especially those in any way connected with the business.

The number of telegraph clerks (operators) who have resigned in Great Britain since 1872 is as follows: In England—males, 1,192; females, 636. Scotland—males, 136; females, 66. Ireland—males, 159; females, 54; total, 2,343. The report shows that about one-third of the staff left for more remunerative employment, or about one-half of those who had proved themselves to be efficient in their service. The return does not include deaths or dismissals.

When the English operators sent a delegation to the Postmaster-General last month, to protest against certain grievances, the delegates were armed with the following business-like document, signed by those whom they represented: "We, the undersigned, hereby pledge ourselves, individually and collectively and unreservedly, to support the committee in any and every action that they may deem advisable for the attainment of our just claims, and the protection of our just interests." There is something striking in that kind of talk.

The full-page advertisement of the Utica Fire Alarm Telegraph Company in this issue deserves the attention of readers of THE OPERATOR. The company does a very large business in telegraph, telephone, fire alarm and other electrical apparatus and supplies, and aims to furnish the best goods at the most reasonable prices. Their switch at the telephone convention attracted much attention. We have seen the Earthquake Learners' Instrument advertised, and can say that purchasers will find it all that is claimed for it. We shall probably be able to present a cut of it next issue.

Messrs. L. G. Tillotson & Co. have in press, to be ready May 15, the sixteenth edition of their well-known work for beginners, "Smith's Manual of Telegraphy." To the manual itself will be added a new and enlarged catalogue of over 100 pages of telegraph, telephone and general electrical supplies, including all the latest improved instruments, batteries, gutta percha cables, line, office and magnet wires, and everything else pertaining to the telegraphic or telephonic business. Messrs. Tillotson & Co. will mail a copy of the new edition of "Smith's Manual" to any address on receipt of 30c.

Under ordinances of Councils of Philadelphia, recently passed, all persons or corporations making use of the municipal police and fire-alarm telegraph poles are compelled to pay 50 cents

annually for the privilege of every attachment, and to pay a license of \$5 for every new pole erected by them, and an annual fee of \$1 on all such new poles. The American Rapid Telegraph Company has just paid into the Philadelphia treasury \$500 as a license for 100 new poles, and is expected to pay \$2,500 additional within a few days for the same purpose. It is expected that from \$10,000 to \$15,000 will be realized by that city by this form of revenue this year.

The works for the Paris exhibition of electricity will soon begin. A viaduct will be built for the English electrical railway by Siemens, which will convey visitors from the Place de la Concorde to the Palais de l'Industrie. The internal arrangements will only be made at the end of the Art Exhibition, which will take place from May to July. The illumination of the palace and its annexes will be unique, as all the systems, both French and foreign, will be employed at the same time. The motive force required will be about 800 horse-power, and more than 50 kilometres of wire will have to be laid down. As regards exhibits, the exhibition will be divided into six groups, comprising sixteen classes. The groups are as follows: I. Production of Electricity. II. Transmission of Electricity. III. Electrometry. IV. Application of Electricity. V. General Mechanics (in their application to Electrical Industries). VI. Bibliography and History.

## NEW YORK CITY ITEMS.

### Echoes from 195.

The force at 195 comprises about 315 operators, 100 of whom are ladies.

On April 19, 52,441 messages were handled in the main office, being the largest number of any day in the history of the company.

Mr. W. D. Chandler, of 195, and wife, have the sincere sympathy of their friends in the loss of their infant son, which occurred at Albany on April 16.

It is said that the habit of opium smoking is indulged in by several of the operators at 195, so much so that their languid appearance attracts general attention.

On Monday, April 25, 3,600 messages were exchanged with Chicago, exclusive of several long specials. The total business of the office on that day was close upon 60,000 messages.

The executive offices of the Met. T. & T. Co. have been moved from the W. U. building to their own building, corner Liberty and Greenwich streets. The Union Pacific Railway Company will hereafter occupy the second floor of 195.

While outside the cry of the public is for clean streets, the prayer of the poor, overworked operator is for pure air. A hundred sickly, haggard looking beings attest the absolute necessity of something being done to improve the ventilation of the overcrowded operating room.

The W. U. athletic games are set for Thursday May 19, commencing at 2.45 P. M. sharp, on the Manhattan Athletic Club's grounds, corner of Eighth avenue and Fifty-sixth street. The committee have decided to keep the entries open until May 10, when they will be finally closed.

That the effervescent lady operator referred to in this column last issue has subsided into a common-place grinder of Morse, is evident from the expression of thankful joy overspreading the countenance of our respected lady manager, and the sober serenity of the operators in her immediate vicinity.

A rumor prevailed last week that three operators were afflicted with a contagious disease and they were denied an entrance to the building. Two of them have certificates from physicians on the bulletin board, vouching for their perfect health, but the third, Mr. Norvell, is authoritatively stated to be an inmate of one of the city hospitals, suffering from the small-pox. The rumor has had the effect of making many seek vaccination.

The dynamo battery is being introduced upon nearly all the quadruplex circuits, and is warmly praised by electricians and operators, with the possible exception of one or two of the latter, who innocently neglected to "cut out" before adjusting their pole-changers. Mechanical

Engineer R. H. Morris is superintending the alterations necessary to introduce the dynamo. He is assisted—under the tables—by Prof. James Larrissey, who "bobs up serenely" after each new job.

An item in the last issue of THE OPERATOR as to the hours of duty assigned to the A. U. and A. & P. operators recently transferred to 195, might be so construed as to reflect upon the spirit which at all times animates Manager Downer—that of impartiality and fairness to all. A closer examination of the facts shows that of the 14 A. & P. operators, 4 were given day tricks; 3 asked for 5.30 to 12.30, and 7 were assigned to the 11.30 to 9 trick. Of the 15 A. U. operators, 8 were given 8 to 5.30 P. M.; 3 were assigned to the 11.30 A. M. to 9 P. M.; 2 took the regular night trick, and 2 the 1 to 8 A. M., or "all night," trick. The A. & P. operators, being the first to arrive, were necessarily used to recruit forces that needed filling up.

### Other City Items.

Mr. Samuel G. Calhoun, for many years operator at "Dx" office, 134 Pearl street, has been transferred to the managership of the W. U. office at 27 Broadway.

The Board of Aldermen last week passed, over the Mayor's veto, the resolutions of the Board, some weeks since, granting a franchise to the Edison Electric Light Company.

The annual meeting of the Atlantic & Pacific Telegraph Company stockholders was held last week. It was in the main a mere formal affair. The old board of directors was re-elected, with the exception of S. F. Barger and H. McK. Twombly, resigned.

The Board of Aldermen in this city have given permission to the United States Illuminating Company and the Brush Electric Illuminating Company to lay tubes and wires and erect poles in the streets. The companies are to pay the city one cent for each lineal foot of street-way used.

On the 19th ult. a painter went to sleep on the cross-beam of a 55-foot telegraph pole of the Fire Department in Mulberry street. A crowd gathered and woke him up. He retaliated by sprinkling them with paint from the brush. Seeing that he was drunk, and fearing that he would fall, a fellow workmen shouted, "Bill, I'll give you a drink if you'll come down." He came down to get the drink, and was not allowed to paint any more.

The trial of Prof. William E. Sawyer, of this city, for felonious assault with intent to kill, in shooting Doctor Theophilus Steele in the face, resulted on the 25th ult. in the conviction of the electric light man. Application was at once made for a new trial, but the Judge reserved his decision. Mr. Sawyer then applied to be admitted to bail, pending an appeal to a higher tribunal. Judge Barrett denied the motion as being premature, the bill of exceptions not having been filed. When that is perfected the motion will be renewed.

While a number of linemen were hoisting timbers from the sidewalk to the roof of a building in Beaver street, last week, somebody threw open an iron window shutter, which was struck by one of the timbers and knocked from its hinges. In falling to the ground, it unfortunately struck and killed a woman who was passing. A few days later, a man who had gone on the roof to shake carpets threw the carpets over the telegraph wires attached to the chimney—seven feet high. He probably thinks now that that was a foolish proceeding, for the weight of the carpets pulled down wires, fixtures, chimney and all on top of him, and necessitated his removal to Chambers street hospital.

At the regular meeting of the New York Electrical Society on Thursday evening, April 21, it was decided to bring on Professor H. S. Carhart, of the Northwestern University, to lecture before the society on Thursday evening, May 5, on the "Fourth State of Matter." To defray the expenses of the lecture a subscription list was started, which has been so generously contributed to that at the time of going to press about \$100 had been subscribed. At the same meeting, Mr. F. W. Jones read his address as president, outlining the future of the society. The latter part of the evening was devoted to the reading of a paper and experiments by Mr. H. L. Bailey, inventor of the telephone service meter.

Although not entirely new, the experiments were interesting, and elicited a vote of thanks from the meeting.

The American District Telegraph Company is charged with resorting to violent and petty methods to break down the opposition of the Mutual District Messenger Company, which claims to furnish greater satisfaction to the public in the delivery of messages. The American District messenger boys, it is said, are accustomed to lie in wait for the employés of the rival company, and to prevent them by threats and blows from answering the summons sent over the wires. Two or three boys have been seen to attack and overpower a lad, and then, by running to the office or house from which the call came, secure the carrying of the message for the American District Company. These assaults have become so frequent of late that the lads who suffer assault have been instructed to apply to the police magistrates for the punishment of their assailants.

## PERSONAL.

Mr. John Pender, M. P., is the chairman of six submarine cables and director of three.

Mr. Nat. Hucker, Manager of the Buffalo, N. Y., Western Union office, has resigned.

Mr. Paul Sheehan has returned to New York from North Sydney, and is now working at 195.

Mr. W. B. Green, Manager at Cambridge, O., was married recently to Miss Annie B. Simons of that place.

Mr. F. H. Cleveland's many friends are pleased to have him with them at North Sydney, whither he has returned from St. John, N. B.

Mr. Allen McWayne, formerly operator for the Lake Shore road, at Toledo, O., is now engaged successfully in mercantile business in Drytown, Cal.

Miss Maggie J. Nutter, for many years manager of the W. U. office at Portsmouth, N. H., has been appointed manager of the Haverhill, Mass. office.

Frank S. Burton, a lineman in the employ of the American Union Telegraph Co. at New Orleans, committed suicide in that city on Sunday evening, April 17.

Thomas Dejarnette, the telegraph operator at Ruffin's depot, Va., who killed his sister under the most distressing provocation, has been finally acquitted of the charge of murder.

Mr. H. L. Houpt, operator at the Ward House, Tyrone, Pa., who was injured by the locomotive explosion in that place recently, can now walk about without the assistance of a cane.

Any information of the whereabouts of David Dingman, an operator who, when last heard of was at Los Angeles, Cal., will be gladly received by his mother, Mrs. Hannah Dingman, Brighton, Ont., Canada.

Mr. G. C. Woodward has been transferred from the Dominion to the W. U. office, North Sydney. Mr. Ward, of Sydney, takes Mr. Woodward's place until the Dominion office closes, which, report says, is to occur May 1.

Ex-Treasurer of the United States John C. New has been elected a director of the Mutual Union Telegraph Company, and has been placed in charge of the superintendence of the construction of the company's western lines.

Frank Moody, operator at the C. I., St. L. & C. depot, seems very partial to W. station on their line. When the fact is known that W. station has a lady operator, who whispers with her fingers, then the partiality is explained.—*Lafayette Times*.

Messrs. MacQuarrie, McLearn and Wheeler have been transferred from North Sydney to the Sydney cable office, to help out the Dominion Co. with the French cable business, the break in the Cape Cod section throwing their business over the St. Pierre-Louisburg section.

The International and Great Northern Railroad, of Texas and Mexico, is providing work for many operators. Mr. D. J. Healey is the Superintendent of Telegraph, with headquarters at Palestine, Texas, and has the largest railroad telegraphic department in Texas—626 miles.

The following are the members of the United States Commission to the Paris Exhibition of

Electricity: The Assistant Secretary of State, Acting Commissioner General, George Walker, Honorary Executive Commissioner; George E. Gouraud and Charles R. Goodwin, Honorary Commissioners.

The newspapers are now telling a story of how, during one of the recent storms, A. R. Swift, Superintendent of Telegraph, got snow-bound at Atlantic, Ia., and was so pressed for food that he and some others ate everything they came across except a little yellow dog, which they chased as far as they could.

First Lieutenant A. W. Greely, Fifth Cavalry, now Acting Signal Officer, will command the expedition for establishing a station for scientific observation at Lady Franklin Bay. Two other officers and twenty-one men and a surgeon will be appointed. The expedition will leave St. Johns, N. F., in June.

Philip H. Fall, the oldest operator in Texas, has the "consolidation" down fine. He explains his leaving the Western Union service and joining the railroad branch as follows: "Their red tape and three-cent men forced me out," he says, "as it did many an old-timer who stuck to them in their days of trouble."

Mr. Michael E. Hayes, an operator in the Portland, Me., W. U. office, died at his father's residence in that city, aged 21 years. Mr. Hayes, who was much esteemed by his associates, had been in the employ of the company for about seven years, and worked his way up from a messenger boy. The floral tributes at the funeral included a very handsome pillow, on which was the word "Rest," presented by his brother operators.

INDIANAPOLIS.—Matters in this city have assumed a more comprehensive character since our last. The A. U. closed its doors on the 15th, and the A. & P. some time previously. Mr. Smith, of the A. & P., went to the Union depot as night chief there, and Mr. Bruce Duncan is now at Oxford, Ind., as agent and operator for the C., H. & I. Ry. All the American Union force, with the exception of Mr. Seabold, former manager of that office, have been transferred to "B" office. Messrs. Turkheil and Carlyle have been added to the day force, and Mr. Dunn takes the A. U. report nights.

Mr. Wm. G. Jones, recently manager of the American Union telegraph offices, has been appointed manager of the Philadelphia offices of the Western Union Telegraph Company, with headquarters at Tenth and Chestnut streets. Mr. Jones enjoys the reputation of being one of the most expert telegraph operators in the profession, with which he has been identified for the past fifteen years, and always as a favorite among his fellow-workers. He is very popular with the business public and among the employes; and this, together with his long experience, assures him success in his new position. He entered upon the discharge of his new duties this morning, succeeding Heber Robinson, resigned.—*Philadelphia Bulletin*.

PORTLAND, Me.—Mr. Howard A. Black, day report and Gold and Stock operator; Mr. John D. Williams, for several years receiving clerk, and Mr. G. Clarence Gordon, check clerk, have been notified that their services will not be required after May 1. This reduction makes the operating force three men less, and the clerical force two less than they were thirteen months ago, when there were two opposition offices open in the city. Mr. Arthur W. Boker, for many years assistant cashier, has resigned rather than attempt to perform the extra duties that would be required of him, and goes to South Windham, Me. This reduction will, in all probability, be found too great as the summer rush of business starts in, and additions will have to be made to the force. However great may be the desire of the new administration to reduce, they should be aware of the fact that an employe's working capacity is limited, and that insufficient force means neglect and delay of the public's business. Already the public themselves in this city view the case in this light, and are eager to patronize another opposition.

## MARRIED.

TEBEAU—CLAYTON.—At Atlanta, Ga., April 12, E. P. Tebeau, of the W. U. Telegraph Company, to Miss Rosa Clayton, of Columbia, S. C.

W. H. MORRISON, President.

E. T. GILLILAND, Electrician & Manager.

# Gilliland Electric Manufacturing Co.,

MANUFACTURERS OF

## TELEPHONIC APPARATUS AND SUPPLIES.

### SPECIALTIES:

#### The Standard Switch-Board and Standard Magneto Call Bell.

The Gilliland Electric Manufacturing Company is the LARGEST ESTABLISHMENT IN THE WORLD making an exclusive specialty of telephonic apparatus. The aim and policy of its officers is to secure the most skillful and intelligent workmen possible, so that the inventive power and creative genius may have a relationship and harmony which will produce the revolutionizing labor-saving effects and perfect construction.

We can confidently announce that our machinery and tools have no equal or approximation by any other establishment—being comparatively new and of the latest improved pattern (not a single piece of second-hand or old machinery in the works), to which we are adding from day to day, that our friends may reap all the advantages that skill, science and ingenuity may give us and them.

#### OF OUR STANDARD SWITCH-BOARD NEARLY 800 HAVE BEEN SOLD.

The Standard has been adopted by nearly all of the principal Exchanges of this country and the International Company for Europe.

We also manufacture Special Switch-Boards, among which are the Fay, Haskin, Vail, Durant and Sabin systems.

Of the many large cities using our Switch-Boards, we mention the following: Boston, Philadelphia, Denver, Buffalo, Toledo, Dayton, Louisville, Vicksburg, Chicago, St. Louis, Kansas City, Hot Springs, Memphis, Omaha, Salt Lake, Montreal, New Orleans, Milwaukee, and numerous large cities of Europe, with the greater majority of the smaller cities, towns and villages of this country.

#### Of the Gilliland Standard Magneto Bell 20,000 are Now in Use, Everywhere Giving Satisfaction.

Our Standard Magneto Bell, which we originally introduced, was immensely popular with the Desk and Battery Box Improvement, and when we added the "Automatic" feature, other parties adopted our styles, in order to secure a part of the avalanche of orders with which we were and are at present overwhelmed.

We also added other improvements, that are being taken up in some form, by every manufacturer in the country, viz:

- The small and compact bell box.
- The base-board with connections run for transmitters.
- The base-board, desk and battery box.
- Our present form of generator.
- Our noiseless metal gear, designed to supersede the noisy cog-wheel and rubber-band nuisance.
- Exterior bell adjusters.
- Hinged door for easy access to apparatus.
- Our improved lock and key.
- Power generator, and many others of importance.

#### We claim for our Standard Bell superiority in the following points:

- 1st. Strength of current generated. All of our bells are tested to ring through 5,000 ohms resistance.
- 2d. Durability is secured through the application of the best mechanical principles and workmanship, together with the use of materials best adapted to the purpose and of the finest quality. All contact points are platina tipped.
- 3d. Our system of interchangeability in all parts of the bell obviates any necessity for expensive repairs in case of accident, as we can furnish any part at a moment's notice, and guarantee it to fit perfectly without alteration. Each piece is made to standard gauge, and we furnish customers with a numbered diagram showing every part of both bell and switch-board.

Having largely increased our facilities, we are now enabled to assure promptness in filling orders. All goods of our manufacture are guaranteed to give entire satisfaction. We shall be pleased to furnish exchanges a sample Magneto-Bell subject to approval, and illustrated and descriptive circular of switch-board, magneto bells, etc.

We are prepared to furnish Telegraph and Electrical Supplies in any quantity at the lowest rates. Shall be pleased to make quotations or furnish any information desired, on application.

Correspondence Solicited. Address,

GILLILAND ELECTRIC MANUFACTURING COMPANY,  
INDIANAPOLIS, IND.

# J. H. BUNNELL & CO.'S NEW STEEL LEVER SOLID TRUNNION KEY

PATENTED FEB. 15, 1881.

BEST IN THE WORLD.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for rapid and perfect Morse sending for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine wrought steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking is absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert or the beginner.

PRICE, \$3.00. FINELY FINISHED, AND LEVER NICKEL-PLATED.

LIBERAL DISCOUNT ON ORDERS FOR COMPANY SUPPLY.

Steel Lever Key sent by mail post paid, to any part of the U. S. or Canada on receipt of the above price, by registered letter or money order.

## THE AMERICAN UNION TELEGRAPH CO.

New York, Dec. 18th, 1880.

J. H. BUNNELL & Co.

Gentlemen:—We have in use in this office, sixty-eight of your Steel Lever Keys.

The general verdict regarding them is, that THEY ARE THE BEST KEYS EVER PUT ON A DESK.

Yours truly,

WM. J. DEALY,

Manager Am. Union Co.'s (Main Office).

## UNION PACIFIC RAILWAY CO. (Telegraph Dep't).

Omaha, Neb., January 15th, 1881.

J. H. BUNNELL & Co.

Dear Sirs:—Your instruments meet with much favor on this company's lines and give good satisfaction. The Steel Lever Keys, especially, are much admired by the operators who generally pronounce them *the best*. They at once combine strength and neatness, and are well adapted for easy and rapid sending.

Yours truly,

L. H. KORTY,

Chief Operator.

## CONTINENTAL TELEGRAPH CO.

New York, Dec. 14th, 1880.

J. H. BUNNELL & Co.

There is nothing that I can say that will be too strong in commendation of your New Steel Lever Key. Every one of our operators, without exception, regard it with decided favor, and I am now satisfied that its general use is not only a positive help to operators' efficient labors, but a decided advantage to the general service of the Company. We are using them in preference to all others.

Yours truly,

J. G. CASE,

City Manager Continental Tel. Co.

## THE ATLANTIC AND PACIFIC TELEGRAPH CO.

New York, Dec. 16th, 1880.

J. H. BUNNELL & Co.

We have six of your Patent Steel Lever Keys in use here in the principal office of this Company. They give entire satisfaction in every way. We consider them a great improvement on the old style of telegraph key.

Yours truly,

P. P. HAUFF,

Manager Main Office, 145 Broadway, N. Y.

## BALTIMORE AND OHIO RAILROAD CO. (Tel. Dep't),

Baltimore, Dec. 28th, 1880.

J. H. BUNNELL & Co.

Gentlemen:—I take pleasure in forwarding to you the accompanying testimonial, voluntarily contributed by the operators in Camden Station Office, to the superior merits of your New Steel Lever Key.

Very truly yours,

CHAS. A. TINKER, Supt.

## BALTIMORE AND OHIO RAILROAD COMPANY.

(Telegraph Department.)

December 27, 1880.

We, the undersigned operators at Camden Station, B. and O. R. R., Baltimore, having fully tested your "New Steel Lever Key," concur in saying, it is the *best*, without any exception, we have ever used.

Respectfully,

CHAS. P. ADAMS,

GEO. R. BUNTING, JR.

E. J. LITTLE,

W. E. KING,

J. W. FERRY,

B. F. HARD,

A. D. FEASEL,

GEORGE BOGGS,

W. W. MOORE,

WM. A. LENZ,

J. F. McLAUGHLIN,

J. W. STAYLOR,

H. P. BILSON.

And I endorse the above, O. W. CLARVOE, Div. Operator.

From the winner of first prize in the fast sending tournament, New York, August 22, 1880, 500 words in 11 min. 14½ seconds.

"Cable Station No. Sydney, C. B.," Dec. 26, 1880.

Prefer it to any other key I have ever used. It is the general opinion of the operators here that the Steel Lever Key is the best they have ever seen.

W. J. CURTIS.

"Your Steel Lever Key proves to be one of the best improvements ever introduced in Telegraphic Apparatus."

J. H. LOUNSBURY,

Manager Am. Union Telegraph, Hartford, Conn.

All our best senders who have tried it here, praise it highly and pronounce it "fast."

R. J. WYNNE,

W. U. Telegraph, Washington, D. C.

THE FOLLOWING EXPRESSIONS OF OPINION ARE ALL FROM THE WESTERN UNION MAIN OFFICE, 197 BROADWAY, NEW YORK.

We have your keys on the Chicago, St. Louis and Buffalo Quads, Western, Eastern and State Press, and C. N. D. Circuits. Without a single exception, the operators regard them as the very best.

FRED CATLIN.

Best key I ever used.

FRANK VITES.

Having worked your Key on Chicago Quad for the past month, can cheerfully say it is the best Telegraph Key I have ever used.

CHAS. F. HUTCHINSON.

Far superior to any other Key.

COURT M. CUNNINGHAM.

Requires less labor, is capable of greater speed, and sends finer and firmer Morse than any heretofore in use.

J. A. WRIGHT, JR., D. B. CASE,

RICHMOND SMITH, E. F. HOWELL.

Consider your Key far superior to any I have yet handled.

J. E. SAYRES,  
Cincinnati Quad.

Like the Key very much. It makes sending easy.

T. H. ALLEN,  
New Orleans Duplex.

Your Key is, without doubt, the best in the world. It is simply perfection.

J. B. COULTER.

Our only desire is to have one of your Keys put on the Pittsburg Quad. Elymiller works on the Pittsburg end.

DENNIS BROWN and M. DURIVAN.

Your Key is, in my opinion, unequalled.

MINOR M. DAVIS,  
Philadelphia Quad.

The finest in the world.

J. B. TALTAVALL, J. H. YOUNG,  
St. Louis Quad.

Best I have ever used.

E. H. MILLER,  
State Press.

Prefer it to any I have ever used.

CHAS. W. MINIER.

The best Telegraph Key we ever handled.

W. D. CHANDLER, } Chicago Quad.  
M. LABAUGH, }

There is but one perfect Key, and this is it.

W. C. ATKINSON,  
Baltimore Quad.

SOLE AGENTS FOR

PATENT SCREW INSULATORS, PONY INSULATORS, LECLANCHE BATTERY, GUTTA PERCHA CABLES, ETC., ETC.

# THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL.

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**  
140 FULTON STREET, NEW YORK.

WILLIAM A. CHILDS, Manager.  
FRANK SHAW, Engineer.

A. G. DAY,

MANUFACTURER OF

Kerite Insulated Telegraph

Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use

Eminent Electricians and Practical

Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, Sir WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

Kerite Insulated Wire and Cables

A DIPLOMA FOR

"Excellence of the Insulation and Durability of the Insulator."

For sale by all dealers in Telegraphic Materials.

# THE AMERICAN BELL TELEPHONE CO.

W. H. FORBES, President.

W. R. DRIVER, Treasurer.

THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

The company desires to arrange with persons of responsibility for establishing

## District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

## PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

## SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

# A BOOK THAT SHOULD HAVE A PLACE IN EVERY TELEGRAPH OFFICE. THE AMERICAN POPULAR DICTIONARY:

CONTAINING

Every Useful Word to be found in the English Language.

WITH ITS

TRUE MEANING, DERIVATION, SPELLING AND PRONUNCIATION.

ALSO A VAST AMOUNT OF

ABSOLUTELY NECESSARY INFORMATION

UPON

SCIENCE, MYTHOLOGY, BIOGRAPHY, AMERICAN HISTORY, CONSTITUTIONS, LAWS, LAND TITLES, CITIES, COLLEGES, ARMY AND NAVY, RATE OF MORTALITY, GROWTH OF CITIES, INSOLVENT AND ASSIGNMENT LAWS, DEBTS, RATE OF INTEREST, AND OTHER USEFUL KNOWLEDGE.

BEING A

## PERFECT LIBRARY OF REFERENCE, IN ONE HANDY VOLUME.

510 PAGES. STRONGLY BOUND IN CLOTH. PRICE ONLY \$1.

The publisher of the AMERICAN POPULAR DICTIONARY claims for it the support of telegraphers and the public, for the following among other reasons:

It contains every word of the English language that enters into speech or writing.

The Spelling of each word is that given by the best authorities.

The Definitions are compiled from a majority of the best writers of the English language.

The Pronunciation of every word is that settled upon by the ablest scholars.

In addition to the perfections of this work as a Dictionary, it contains a vast amount of information upon many kinds of useful information not to be found in any similar work; but all absolutely necessary to every one who wishes to be acquainted with the leading subjects of conversation and composition.

TELEGRAPHERS, more than any other class of men, need a good and handy Dictionary in their office at all times. There is no Dictionary published that will give them better satisfaction than The American Popular.

Dictionaries printed in England are of little use in this country, where many words are differently spelled, and the meaning not always the same. Send for the American Popular Dictionary, and get the best Dictionary at the price published.

The American Popular Dictionary is printed from new type, with extra clear and legible face, and handsomely bound in cloth and gilt. From it a speaker or writer can glean an amount of knowledge impossible to find elsewhere collected in one book.

Worth ten times the price.—N. Y. Times.

A perfect dictionary and library of reference.—Leslie's Illus. News, N. Y.

We have never seen its equal, either in price, finish or contents.—Chris. Advocate.

Copies promptly mailed, postage prepaid, on receipt of price, \$1, in currency or postage stamps, or by Post Office order. Liberal discount to agents.

Four copies by mail or express, prepaid, \$3.00.

THE OPERATOR for fifteen months and the Dictionary only \$2.00.

## SAM JOHNSON:

The Experience and Observations of a Railroad Telegraph Operator.

By J. ALBERT CLIPPINGER,

Author of "The Pedagogue of Widow's Guich," "Samson" Papers, etc.

176 Pages. Price, in Paper, 75c.; in Cloth, \$1.

This book consists of a series of short stories or sketches, illustrative of the checkered life and experience of a representative Railroad Telegraph Operator—a near view of the daily and nightly working of the busy bees who manipulate the two greatest agents of modern civilization—electricity and steam.

"Sam Johnson is one of the most entertaining books in the whole library of railroad literature. It is a series of well-told sketches and stories relating to every phase of railroad life. Some are humorous, some thrilling, some pathetic, and all interesting. The book is written by a practical railroad operator, with a ready pen and a quick eye for the salient points of a joke or incident."—Railroader.

## OAKUM PICKINGS:

A Miscellaneous Collection of Stories, Sketches, Essays, and Paragraphs, Telegraphic and General, By Walter P. Phillips, "John Oakum," with a fine Steel Plate Portrait of the Author.

Fourth Edition, 188 pp.; Medium 12mo; Paper, 50c.; Cloth, 75c.

The welcome accorded this, the first book ever published with the object of giving the telegraph profession a literature of its own, has been general and hearty, on the part of both telegraphers, press, and general reading public in all parts of the country. Mr. Phillips, the author, is well known to the fraternity as a spicy, original, witty, entertaining, and popular contributor to telegraphic and humorous literature, and his character sketches of "Jim Lawless," "Tip McClosky," "Posie Van Dusen," "Cap. De Costa," etc.—all of which are contained in Oakum Pickings—have won for him an enviable reputation as a humorous sketch writer.

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00  
The three books and THE OPERATOR one year, or any of our other \$1 books..... 2.75  
The three books, THE OPERATOR one year and the Dictionary, or any other \$1 book..... 3.50  
"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with THE OPERATOR, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

Address: W. J. JOHNSTON, Publisher,

P. O. Box 3,332.

No. 9 Murray Street, New York

# THE DEAF **HEAR**

BY THE USE OF

## Peck's Patented Artificial Ear Drums.

Not observed in use, and comfortable to the ear. Cushioned, ventilated and harmless, and perform the office of the natural drums. The only perfected and patented Ear Drums. Also patented in Europe and Canada. Send for Treatise on the Ear; mailed free.

DR. J. P. P. PECK, Proprietor,  
No. 115 Nassau Street, New York.

### WANTED.

The address of every Operator and Book-keeper in the United States and Canada. Send postal card to

**E. W. FARNHAM,**

72 Monroe Street, Chicago, Room 6.

## THE JOHN A. ROEBLING'S SONS CO., TRENTON, N. J.

And No. 117 Liberty st., New York,  
Manufacturers of

### GALVANIZED TELEGRAPH WIRE

OF ALL QUALITIES.

No. 6 Wire in  $\frac{1}{2}$ -mile bundles, 550 pounds per mile.  
No. 7 Wire in  $\frac{1}{2}$ -mile bundles, 470 pounds per mile.  
No. 8 Wire in  $\frac{1}{2}$ -mile bundles, 388 pounds per mile.  
No. 9 Wire in  $\frac{1}{2}$ -mile bundles, 330 pounds per mile.  
No. 10 Wire in  $\frac{1}{2}$ -mile bundles, 268 pounds per mile.  
No. 11 Wire in  $\frac{1}{2}$ -mile bundles, 216 pounds per mile.  
No. 12 Wire in  $\frac{1}{2}$ -mile bundles, 168 pounds per mile.  
No. 14 Wire in 1-mile bundles, 98 pounds per mile.

This Wire possesses the highest electrical conductivity, which is necessary to make Telegraph and Telephone Lines work with certainty and ease.  
Special attention given to

**Telephone Wire,**

for which No. 12 is the average size used.

## THE BISHOP GUTTA-PERCHA WORKS,

Original and only Manufacturers in the U. S. of

### PURE GUTTA-PERCHA GOODS,

422, 424, 426

EAST TWENTY-FIFTH ST., N. Y.

ESTABLISHED IN 1847.

### S. BISHOP, PROPRIETOR

of the BISHOP GUTTA-PERCHA WORKS, begs leave to announce the acquisition of the exclusive right within the United States and the Territories thereof, to manufacture and sell Gutta-Percha Covered Wires of every description, under Letters Patent of the United States (No. 65,019), dated May 21, 1867, granted to George B. Simpson, now owned by Clinton G. Colgate, for the use of Gutta-Percha as a covering or insulator of wires for atmospheric or submarine telegraphic communications or for other electrical purposes, the validity of said Patent having been established by a decree made by the Circuit Court of the United States, held in the City of New York, dated Dec. 8, 1878.

The INSULATING PROPERTIES OF GUTTA-PERCHA for Submarine Telegraphic Cables have been thoroughly tested for the past thirty years, and for subterranean purposes, after many tests in Europe, and a continuous use in this country for seventeen years, its superiority is conceded over all other insulating materials and compounds.

**Submarine Telegraph Cables**, 50 varieties, one to ten conductors.

**Submarine Telegraph Canal Cables**—any number of conductors.

**Aerial and Underground Cables** of all styles. Hemp armor covered.

**Lead-Covered Telegraph Cables**, one to seven conductors.

**Office Cables**, one to seventy-five conductors, gutta-percha and cotton-covered.

**G. P. Insulated Wire** of all sizes.

**Fuse. Leading and Connecting Wires** for submarine and mining purposes.

**Marks' Compound Office Wires**, various sizes, for office, underground, and outdoor use.

**G. P. Office Wire**, cotton-covered.

**Flexible Elevator Cables**, any number conductors desired, of every style, and for all purposes.

**Compressed Electric Cotton and Linen Double and Triple Covered Cordage** any style or pattern.

**Burglar Alarm, Call Bell and Annunciator Wires**, double cotton wrapped and saturated with any preparation.

**Magnet Wires**, copper and German-silver, cotton, silk, and fibre covered.

**Copper Wires**, specially covered for electrical lightning purposes.

**Telephone Flexible Cords and Magnet Wires**, finest and best manufactured.

## TELEGRAPHIC SPECIALTIES.

### THE GIANT SOUNDER PERFECTED.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5 00.

### THE DELANY PATENT REVOLVING DISC,

OR UNIVERSAL PLATINA CONTACT KEY.

This key embraces the only positive remedy for sticking; obviates direct anvil pounding, and thereby prevents operators' paralysis. Legless, hard rubber base, nickel-plated, and the handsomest, most durable, and only perfect key manufactured. Price, \$5; by mail, \$5.35.

### CHAMPION LIGHTNING ARRESTER.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

### THE CHLORINE BATTERY.

D. H. Fitch Patent, Sept. 16, 1879. For telephones, burglar alarms, call bells, etc. Price per cell, \$1.75.

### PREMIUM LEARNERS' APPARATUS.

**ONLY \$5.00.**

**Not the Cheapest, but Guaranteed the Best!**

The **PREMIUM LEARNERS' APPARATUS** and OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

## A CARD.

TO WHOM IT MAY CONCERN:

In last issue of this paper Mr. Ross takes occasion to criticise our conduct in publishing his testimonial, which we did verbatim; the first part was given us orally; the second part we have in writing, all unsolicited; and in none of his letters, or personally, has he ever withdrawn or contradicted the testimony. Had we known, however, when we published it, that Mr. Ross was no longer our friend, we certainly should not have done so. Any one who met and talked with him at the Niagara convention will remember his earnest advocacy of our board, which, by the way, we have very much improved since that time. The fact of the matter is, Mr. Ross is a stockholder in the Western Electric Mfg. Co., and he transferred his patronage to them, and he feels sore to think he committed himself to us, and now seeks to injure us for having, in a business-like manner, used his voluntary testimony. He remarked to us one time when discussing Western Electric stock, "I drew my 100 per cent. like a little man." No doubt he desires to repeat that pleasant task this year, and has become their earnest solicitor and advocate for obvious reasons.

Respectfully,

C. E. JONES & BRO.

### Individual Calls for Telephone Lines.

Although the telephone is, perhaps, the simplest instrument ever developed by the brain or constructed by the hand of man for electrical communication, it is very apparent that certain accessories, both before and after the fact, as it were, are essential to its success as a factor in business and social life. Since the telephone itself cannot generally speak sufficiently loud to notify its patrons when a message is about to be sent (nor, indeed, is such a state of affairs desirable), it was seen at a very early period in telephonic history that some calling or signaling device was necessary. The telephone was first introduced on private lines, usually of limited length, and generally with but two stations, one at each end, which were already built and fitted with Morse telegraph instruments. The Morse instruments were, therefore, utilized as the first telephone calls. It soon became evident that a degree of skill was requisite to work the Morse keys and sounders thus used, and that unless some more popular method of signaling were adopted the onward march of the new invention would be checked, and the little giant would remain a stunted dwarf. The result of this was a great increase in the number of electric bells manufactured, for any one could readily notice the silvery tone of the single stroke, or the imperative rattle of the vibrator, even when the monotonous rhythm of the Morse sounder would pass unheeded; and so on the before-mentioned private lines the bells succeeded the sounders, the sounders were laid on the shelf, and the telephonist was once more happy and contented. But only for a short time; for soon it was seen that the number of stations on a private line could not be limited to two; and when that number was largely increased, the constant ringing of bells, melodious as it might be *per se*, and sweet as the Bells of Corneville, yet became a trifle monotonous, and once more the wearied ear yearned for rest and silence. Moreover, the telephone exchange system by this time began to rise into view, and it was then considered peculiarly impossible, or at least undesirable, to have individual lines, or, indeed, less than five or six stations on any line. The projectors of the primeval telephone exchanges were or had been telegraph men, and the system they inaugurated was naturally a system of calling consisting of single stroke bells on a closed battery, the ringing being accomplished by breaking and closing the circuit the

requisite number of times; and the number of stations on each line varied from four to over a dozen. It is obvious, as stated above, that when such a number of stations were placed in circuit together, if much business was done on the circuit, the ringing would practically be perpetual and no peace or quietness could be obtained. Still it was found that some persons liked the continual jingle, even those who might be supposed to be troubled the most by it. An example on the point is the following, which came under the writer's personal observation: A reverend gentleman was a valued subscriber to a telephone exchange in one of the smaller cities in Massachusetts—his telephone and bell being placed in his study—and was located in one of the busiest circuits.

The exchange manager at length took pity on the clergyman and offered to place him on a quieter circuit.

To his surprise, however, the minister declined to be transferred, saying that he did not mind the jingle; that he rather liked it, if anything, and in fact never noticed it. He was, of course, not transferred. But when the astonished exchange manager related the circumstances to a mutual friend of himself and the divine, he was greeted with the dry remark: "perhaps he doesn't mind it, but it is very perceptible in his sermons."

This gentleman was an exception, an honorable exception, perhaps, but still an exception, and a demand, which is ever the pioneer of a supply, sprung up for an individual signal.

It is proper here, for the benefit of the un-initiated, that the term individual signal should be defined.

It signifies literally, a means for calling the individual. That is, in a circuit of say six stations, at the will of the operator any one of the six can be called without signaling or attracting the attention of the others. It is not the least of the wonders of the telephone that it has given an impetus to so many branches of electrical invention, and this branch of the "individual call" has been the most prolific, bore early fruit, and is still bearing. After the early demand for such a call-signal, it came to be seen that on the busy lines of our large cities, one, or at the most, two stations only could be practically operated, simply because when more than that number were placed on a line they were continually getting in each other's way. But on the social lines in suburban districts, or in exchange systems in the smaller cities and towns, prices could not be raised as they were in larger places, and it was, therefore, found necessary to do one of two things, either submit to the constant

ringing or find an individual bell or call that combined all the requisite virtues—one that was cheap and good, simple in operation and sure in result, one that could be depended upon to call the right man at the right time, and, what is equally important, one that would not call the wrong man at the wrong time; and, finally, one that was simple in construction, would not easily get out of order, that when out of order could be easily fixed by the exchange managers, who frequently were anything but *au fait* at such work, and one that was cheaply maintained.

Nothing answering these requirements was then in the market, but the demand was seen and the result was that the inventive genius set to work, and up to the present time some fifty patents have been issued on this one subject.

The essential points that every individual signal instrument should possess are the following:

1. They should be able to call up the station required.

2. This must be done to the exclusion of all the other bells or stations on the line.

3. When a station is to be called on a line and other stations are between the station calling and the station called, those between must not be rung up in passing.

4. A union, zero, or initial point and a method for bringing each apparatus to such point, so that all the instruments may commence each operation together.

Other and auxiliary operations are frequently performed or attempted, such as a dial and index finger, showing which station is being called, or an automatic cut out, which shall cut out all the telephones except the one wanted; but such operations are not essential and, in the words of a brilliant but short-lived contemporary, "in the attempt to make these instruments self-acting, they are made self-hampered."

Having thus briefly delineated the necessary virtues of a good individual call, we will describe the several principles which have as yet, in one form or another, been universally recognized.

These are, first, systems in which the features of strength and polarity are taken advantage of, employing apparatus similar to the quadruplex. It is obvious that if we have a line of four subscribers, and at each station we have a relay which, when affected by the current, closes a local circuit and rings a bell, by adjusting the relays so that No. 1 responds only to a weak current and No. 2 only to a strong one, we provide for two stations at once. If we now add two other bells, similarly arranged, but adapted only to respond to currents of opposite polarity, we provide for two more stations and secure for ourselves a system of four individual stations per line; such is one of the best methods suggested. To a practical man, this idea of employing some form of relay and a local circuit, including a bell, is more hopeful than most others.

Another way is to provide an instrument operated directly by successive pulsations of electricity, which rotate a star or ratchet wheel carrying on its axis a circuit wheel, which when brought to a particular position, differing in each instrument, closes a local circuit. This step by step principle is used in many such instruments.

These were the first attempts at solving the

problem. The next was on a different tack, and consisted in allowing each bell-hammer to move, but interposing a mechanical obstacle in the way of each hammer except the one at the station wanted. A bell of this class is used at West Winsted, Conn. (some sixty are in use there), and consists broadly of an electro-magnet carrying two armatures, one polarized, the other neutral. The neutral armature has a pawl, which step by step rotates a ratchet-wheel, that has at one point a notch between two teeth deeper than usual. The position of this deep notch differs for each bell, and only when the deep notch arrives in front of the pawl of the polarized armature which carries the bell-hammer, can the said bell-hammer reach the bell. The wheel is brought round by successive battery currents, which do not affect the bell-hammer armature, but when the wheel is brought to the proper point, rapidly alternating magneto currents are sent which work the polarized armature and ring the bell. These bells have given satisfaction. It is, however, but just to say that their success is in a great measure due to the exchange manager at West Winsted, who is a telegraph man of no ordinary ability, and who would certainly succeed in making any bells work that had any work in them.

The next novelty presented, and one that, although patented, is still a novelty to most of us, is one that is decidedly the germ of a wonderfully good system, inasmuch as it needs no complicated apparatus, and has no wheel movement, is as follows: The bells at each station are provided with two electro-magnets, and the circuits leaving the central station are so arranged—one series running concentrically and another radially, one of each class running into each substation—that it is only when the key of each is pressed at the same time that the bell at the junction of the two can ring.

Soon afterward another idea came on the scene. It was to have the signaling bell in each subscriber's station in a shunt or branch circuit; or in common parlance, short circuited, and using mechanism, either step by step or synchronous clock work, to break the short circuit at a stated time or a given number of pulsations, thus including the desired bell in the main circuit, when it could, of course, be rung. This idea at the present time appears to be the banner bell, and is gradually becoming popular.

Still another suggestion is to furnish each bell with an electric ground switch, a single current of a given direction throwing on a ground at each station. This, of course, cuts off all the bells except the first one. They are then restored to the line one after another, each one locking its hammer as the next one is brought into circuit. When the desired bell is once more cut in, it is rung by magneto currents.

We have thus outlined much of what has been done in this line of invention. It is impossible, however, even now, to overstate the difficulty of making a really good bell which shall accomplish all it should. When that bell does appear, its inventor may depend upon reaping a rich harvest.

We promise ourselves the pleasure at a future day of giving a detailed description of the several types and principles embodied in the best bells patented.

The ingenuity expended on some of them is wonderful to contemplate, and for the majority it is greatly to be feared that virtue will have to be its own reward.

#### Notes and Queries on Electricity and Electro-Magnetism and their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

Q. 118. When we require an electro-magnet for long lines, or for circuits of great resistance, why do we call for one of high resistance? Is high resistance advantageous?

A. No. Resistance, considered by itself, is a positive disadvantage, because every additional unit of resistance added to the circuit tends to further enfeeble the current. But, as already stated, to make the most of the existing current, we require many turns of wire and the resistance is a necessary but unwelcome adjunct. If

we could obtain the convolutions without the resistance, it would be so much the better, but that is impossible; and it has been found convenient to designate magnets intended to work on long lines, as high resistance magnets; not because it is *in virtue* of their high resistance that they work better, but simply because they have the high resistance, and to denominate them as such is an easy way to distinguish them.

Q. 119. In making calculations on the strength of electro magnets, is the resistance of the battery to be taken into consideration?

A. In short circuits, where the resistance is proportionately large to the resistance of the rest of the circuit, yes. For example, in a local circuit of a Morse sounder there is practically no resistance outside of the sounder coil, except the battery. It is obvious, then, that it *must* be considered and the coil made equal to it.

But when the battery of a very long line is in question, it is not necessary to include the resistance of the battery with that of the line, because, though large, it is yet, in proportion to the line, very small; and to simplify the calculation, it is usually ignored.

Q. 120. Has the length of the iron core any effect on the working of an electro-magnet?

A. Yes. Electro-magnets with short cores both charge and discharge quicker than those with long ones. Advantage of this fact has been taken by the telegraph companies and all the later forms of relay have short cores. A magnet also works quicker when charged by a battery of many cells than when few are used. When strength rather than speed of action is required, it is well to employ magnets with long cores, because the convolutions of wire can then be increased in number without decreasing their distance from the core, by adding a great number of layers of wire.

Q. 121. What are earth currents?

A. They are currents which are always flowing through the wires, and which depend for their existence on a difference of potential between the two points of the earth at which the line is terminated. They are, therefore, currents flowing from one part of the earth to another, which being, of course, subject to the ordinary laws of electricity, and finding another path open to them at the ground plate, where they enter, divide there, part of the current taking the wire route to the distant point, the other part taking the route through the earth.

They vary in strength at different periods in the day and year, and sometimes are so strong as to render the working of a line difficult. They are then called electric storms.

Sometimes they flow in one direction, sometimes in the other, and in any case are very unwelcome visitors in telegraph lines.

They are particularly frequent on long cables, and endanger the safety of the cable. They also render testing with the galvanometer very uncertain and incorrect.

Q. 122. How may the effects of earth currents on telegraph lines be obviated?

A. On ordinary telegraph lines this can be done in two ways: The first mode may be adopted when two wires run parallel to each other, and consists in abandoning the use of the ground wires at the terminal offices, and looping the wires, so as to form a metallic circuit. In practice, if the wires are looped together at but one end, the result is satisfactory.

The second method may be used where there are *not* two wires parallel to each other, and is effected by removing the ground wire at one end of the line and lengthening the circuit by connecting another line running in another direction to it, so that if a straight line were drawn connecting the two end offices, it would be out of the direction of the earth current prevailing at the time.

In the case of submarine cables of considerable length, the same result is effected by the

use of condensers, which are interposed between the ends of the cable and the ground.

Q. 123. Are there any other currents which appear on telegraph lines without an apparent cause?

A. Yes. If the earth plates of a circuit are of different metals, a permanent current will be set up, varying in strength according to the metals used. For example: If a copper plate be buried in the earth at one end of the line and a zinc plate at the other, the current will be comparatively powerful. If one earth plate be of lead and the other of iron, the current will not be as strong as that developed by the copper and zinc, but it will still be quite perceptible.

This may readily occur, and to the amateur electrician might prove very puzzling. If, for instance, the wire be grounded on an iron gas pipe at one end of the line, and on a lead water pipe at the other, and a current appears, as under the circumstances it surely will, it needs some experience to determine its origin. When suspected, one ground or the other must be changed until no current passes.

This current has been utilized, under the name of the earth battery current. It was used by Gauss in Germany at an early date, was subsequently employed by Bain to work electric clocks, and in 1846 was used by Steinheil on a Bavarian telegraph line twenty miles long. For telegraphs, however, it has not attained any remarkable degree of success.

Q. 124. What systems of commercial telegraphy are in use at the present time?

A. In America, the telegraphs now in general use are: 1st. The Morse, with its improvements of duplex, quadruplex and harmonic telegraphy; its use is universal.

2nd. The type-printing telegraph, comprising the Hughes, Combination and Phelps improvements, used chiefly on trunk lines between Boston and New York, New York, Philadelphia and Washington, and New York and Chicago.

3rd. A variety of the automatic system, known as the "Rapid" telegraph.

In nearly every country the Morse system is prevalent, and maintains its supremacy on account of its simplicity, its comparative accuracy, and the speed with which it may be manipulated.

The Wheatstone needle system is still employed on many circuits in England, but is being gradually superseded by the Morse.

Its use is advocated by English writers for circuits, which have many stations, none of which singly do much work, but which collectively have enough business to occupy a wire; and for railroad service. The maintenance of the needle system is economical.

A dial system, called the Wheatstone A B C, is also extensively employed there, and is especially adapted for branch lines and offices in small villages where there is not enough work to pay for an expert operator. The Wheatstone Automatic is also much used. Indeed, England has been most successful in automatic telegraphy.

Q. 125. What are the principal special systems used in America?

A. The municipal fire telegraph system, the American District or messenger business system, the police telegraph, the Gold and Stock printing telegraph, and the automatic fire signaling system.

Q. 126. Describe in general terms the construction and operation of the municipal fire telegraph?

A. The fire telegraph system of America has repeatedly proved its great value, and is a well-known American institution. It has been brought to a state of great perfection by the Gamewell Company.

The lines all radiate from a central point, connecting with a number of signal-boxes in various parts of the city. They are uniformly what are called metallic circuits, the ground forming no part of the circuit; that is, the line leaving, for example, the copper pole of the battery, after making its circuit of the city, returns by another route to the zinc pole of the battery.

In large cities the signals transmitted from the boxes are carried by the wires to a central office, from which the alarm is given to the engine houses and other necessary points.

The action of the signal boxes is: when the handle is pulled, a detent is tripped, which permits a circuit wheel to revolve by a train of clock-

work, and so to break the circuit a given number of times, thereby giving the required signal. Portions of the edge of the wheel are made of non-conducting material and a metallic spring, which forms part of the circuit, presses on the edge of the wheel.

When, therefore, the insulated portions pass under the spring, the circuit is broken. It will be seen that by altering the relative number and position of the non-conducting portions of the edge of the wheel any required signal may be given.

The circuit being thus closed and broken by the revolution of the wheel under the spring, the armature of a relay is correspondingly attracted to and withdrawn from its magnet at the central office, and when falling back closes a local circuit and strikes the signal on a bell, at the same time recording it on a register. The operator then repeats the signal to every required point, and the alarm is given. In smaller places, although the operation of the boxes is the same, the alarms when sent in are automatically made known to the proper parties and to the public by automatic repeaters, which set in action bell strikers at pre-arranged points. The attendance of an operator is thus rendered unnecessary.

T. D. L.

#### Sudden Death of Mr. J. N. Ashley.

On Tuesday morning, April 26, Mr. James N. Ashley, editor of the *Journal of the Telegraph*, was taken with a congestive chill on his way to New York. Fortunately his daughter was with him at the time, and took him back to his residence at Greenville, N. J. Although the fact of his illness was known among his friends in New York, it at first caused no particular alarm. Indeed, we did not consider it of sufficiently serious a nature to even mention it in last issue of *THE OPERATOR*. Mr. Ashley, however, notwithstanding the united advice of three of the most competent physicians, and of every care and attention that love and devotion could suggest, sank rapidly and died at 5:30 P. M. on Monday afternoon, May 2. The immediate cause of his death was improper valvular action of the heart and congestion of the lungs. The funeral took place at Greenville on Thursday afternoon, May 5, and was attended by a large delegation of prominent New York telegraphers, among them being T. A. Edison, the inventor.

James Nye Ashley was one of the oldest telegraphers in the country, having been connected with the business in various capacities for over thirty years. He was the son of Samuel Ashley, an able lawyer, and was born at Providence, R. I. Before he entered the telegraph business he was assistant postmaster at Providence and was connected editorially with the *Sentinel* and *Republican Herald*, of that city. His first telegraph position was Manager of the House Printing Telegraph office, Providence, in 1851. He was afterward manager of the same company's offices at Springfield, Mass., Columbus, O., Boston and New York, and was subsequently appointed Assistant Superintendent under A. A. Lovett. Later he held the position of Night Manager for the Associated Press in this city, and then edited and published the *Telegrapher* until the death of Fred. J. Grace, when the *Telegrapher* was discontinued and Mr. Ashley became the editor of the *Journal of the Telegraph*.

In the latter part of 1853 or beginning of 1854, Mr. Ashley, accompanied by B. K. Baldwin, a House printing operator, now in the insurance business in Philadelphia, went to England to place the House printing telegraph upon the lines of the British and Irish Magnetic Telegraph Company. In consequence, however, of the effects of static induction on the underground

lines, it was found impossible to work the instruments with any degree of success, and the enterprise was abandoned.

During the war of secession he was army correspondent of the New York *Herald*, and afterward had charge of the *Herald* bureau at Washington. Since the retirement from the business of Mr. Watson, he has acted as secretary and general agent of the Telegraphers' Mutual Benefit Association.

Frank L. Pope, an old-time friend and former business associate of Mr. Ashley, furnishes the following particulars, which we take the liberty of publishing as received:

"I first became intimately acquainted with Mr. Ashley in 1868. He had been since the close of the war the agent of the New England papers in the Associated Press office. At that time I was editor and publisher of the *Telegrapher*, but finding my duties as superintendent of the Gold Reporting Telegraph too absorbing to permit me to give the necessary attention to the paper, an arrangement was made by which Mr. Ashley took charge of it, still retaining, however, his position in the Associated Press. In 1868, at the suggestion of Mr. Ashley, I prepared the book 'Modern Practice of the Electric Telegraph,' which was published at his expense. He attended to all the business relating to the publication and sale of the book, and but for his suggestion and co-operation it would never have appeared. In 1869 Mr. Ashley and myself, in company with T. A. Edison, and two or three others, organized the Financial and Commercial Telegraph, the object of which was to supply quotations of gold and exchange throughout the city by means of printing instruments. The office of this concern was at No. 80 Broadway. This business was continued a few months when we combined with it the construction and sale of private telegraph lines for the operation of which Edison and myself had jointly invented a printing telegraph especially adapted to that service. We carried on this business until May, 1870, when we organized a corporation called The American Printing Telegraph Company, which took the private line business, the management of the company still being under the direction of Mr. Ashley and myself.

"In 1871, the Gold and Stock Company, having obtained a controlling interest in this concern, consolidated it and continued it as their private line department, which afterward grew into the Metropolitan Telephone and Telegraph Company. This business was very successful from the start, and was only sold to the Gold and Stock Company because it increased so fast that we could not in any other way obtain the necessary capital to carry it on. In 1871, J. N. Ashley, F. L. Pope, S. C. Hendrickson and J. D. Lincoln formed an association to carry on the electric railroad signal business, which was continued until 1880, when the business was consolidated on very favorable terms with that of the Union Electric Signal Company, of Boston.

"Mr. Ashley continued to carry on the *Telegrapher* from the time of his taking charge of it, in 1868, until the death of Fred. J. Grace, editor of the *Journal of the Telegraph*, when he accepted a proposition to become Mr. Grace's successor, after which the *Telegrapher* was discontinued and its subscription list transferred to the *Journal of the Telegraph*. In consequence of certain complications growing out of the strike among telegraph operators, Mr. Ashley relinquished his position in the Associated Press, the month after the close of the strike, and thereafter attended exclusively to his other business."

Mr. Ashley leaves a wife and two children, who, with his aged mother, brothers and sisters, have the sincere sympathy and condolence of the fraternity in their great and sudden bereavement.

#### The Suits against the Consolidation.

After all the legal sparring and vexatious delay in the suits of W. S. Williams against the Western Union, and Rufus Hatch against the same company, they were formally brought to trial on Friday last, the 13th inst.

The number of lawyers retained on the case is

very large. Before the trial began men and boys brought in large piles of books, comprising ledgers, cash books, transfer books, and all the business paraphernalia of a telegraph office, which they threw carelessly about the floor. Judge Truax smiled grimly, but the fifteen or twenty lawyers expected, was the observed of all.

Mr. Robert Sewell opened the case for the plaintiff, and read parts of the complaint reciting the object of the action. He also declared that if the witnesses told the truth the true import of the meetings at which the consolidation was effected would be disclosed. In December, 1880, he said, the American Union had established itself throughout the country, but the majority of its stock was soon under the control of the Western Union Company, as was also the Atlantic & Pacific stock. At recess Mr. Sewell announced that he was unwell and did not feel able to continue, and that the case was adjourned until Monday morning.

Both suits were brought for the same purpose, viz., to restrain the Western Union Company from issuing \$15,526,590 of its increased capital stock to its present stockholders on account of dividends which those stockholders would have received if the surplus earnings of the company since 1866 had not been invested in real and personal property. The injunctions already granted restrain the Union Trust Company and the Western Union's directors from assisting in the distribution of such a stock dividend. Immediately after Chief-Justice Sedgwick made his injunction order some time ago, the Western Union Company, acting under the advice of counsel, issued to its stockholders, through the Union Trust Company, certificates of indebtedness in lieu of the shares of stock which it was restrained from issuing. This proceeding was the ground of motion to punish the defendants for contempt.

In connection with a pending injunction in these cases, the Western Union now holds the following letter, written a week before the preliminary injunction referred to was issued:

"P. O. address, box 412.  
"OFFICE OF SEWELL & PIERCE,  
"[Private.] Attorneys and Counsellors,  
"ROBERT SEWELL, } No. 206 Broadway,  
"JAMES F. PIERCE, } NEW YORK, April 28, 1881.  
"MY DEAR SENATOR: The telegraph people have industriously circulated a report that there was to be a decision of the W. Un. to-day. My partner, Mr. Sewell, says it is a libel on the Court, who offers to bet two to one that decision will not be made to-day, and when it is made it will not be in favor of the Co.

"Faithfully ys, JAMES F. PIERCE.  
"HON. A. S. PADDOCK."

This was written by one of the attorneys for the plaintiff, and addressed to ex-United States Senator Paddock. It is certainly strange that one of the counsel should thus, a week in advance, be able to speak for a judge on the bench, and to bet 2 to 1 on the result, and it may yet further complicate the tedious process of law.

In the Pennsylvania Lower House, the bill to prevent consolidation of the telegraph companies in that State is now well up on the second reading calendar.

Meanwhile the Monopoly quietly goes on monopolizing.

An agreement has been signed by the officers of the Western Union Telegraph Company and the president of the Northwestern Telegraph Company for a lease of the latter's lines. The negotiations which have ended in this have been pending a long time, but the matter has been more particularly discussed in the last two weeks, during which President Simmons, of the North-

western Telegraph Company, has been in this city. This company has its eastern terminus in Chicago, and thence its lines extend to the principal cities and towns of Wisconsin, Minnesota, and out into Dakota Territory.

#### Reminiscences of the Pacific Coast Telegraphy.

The telegraph at that time was a source of great curiosity to almost every person along the route, particularly to the native population, who looked upon the construction of the line with the greatest wonder. Many of them in ignorance of its real purpose and not understanding the use of the poles erected along the road at regular intervals, strung with wire with a cross-arm on each pole, conceived the idea and expressed it as their belief, that the Yankees were fencing in the country with crosses to keep the devil out.

From this period the work was successfully carried on, without any incident of importance until we reached San Jose. At this place the first regular station was opened. The office was fitted up on the day following our arrival, and I soon had it prepared for business. While these preparations were being made the portion of the street fronting the office had rapidly filled up with a crowd of people, a large proportion of whom were native Californians, all manifesting the greatest interest, and desiring to know what was going on. The day being warm, the windows of the office were wide open. As they opened on the sidewalk, all that I was doing inside was plainly visible to those standing without. Observing the anxious and inquiring expression on the faces of those who had managed to get near enough to thrust their heads through the open window, it occurred to me to act in a very mysterious manner, in order to see what effect it would have upon my spectators. I had just received the first message from San Francisco, which, after it had been copied, I placed in an envelope. On seeing me do this my audience thought, as I supposed, I was preparing the message for transmission. I took it from the table on which I had placed it, and instead of handing it to the boy for delivery, I put it, holding it in my hand, under the table which was provided with sides sufficiently deep to hide the envelope from their view. As I did this I kept my eyes fixed on the wire, while, with my right hand, I took hold of the key and began working it. The moment the crowd heard the first click of the instrument they all rushed from under the veranda out into the street to see the message in the envelope pass along the wire. On seeing them rush out tumbling one over the other to catch a glimpse of the message, we on the inside burst out into one long and continued roar of laughter. Our laughing seemed to puzzle them still more. But little by little they began to realize that they had been made victims of an innocent joke. They at first manifested signs of disappointment that their expectations had not been realized; but instead of passing any time in vain regrets, they immediately set to work to find out what really had become of the mysterious message. And, after all, their conception of this, although a mistake, was a very rational one. To one who had neither heard of the telegraph and electricity, nor conceived the possible existence of the latter, what could be so natural than to suppose that the envelope and its contents were propelled under the agency of a motive power along the wire from one point to another. As they had failed to see it pass along the wire, their second supposition was that the wire was hollow and that the envelope with its message inclosed was forced through the hollow part, and with this idea they asked whether such was not the case; nor would they believe the contrary until, for themselves, they had examined the end of the wire. Conviction on this point put an end to their conjectures. The telegraph was to them the very hardest kind of a

conundrum. It was impossible of solution. Their final conclusion was that it was an enchanted spirit—but whether a good one or an evil one they could not quite determine—over which I had such control that it was obliged to do my bidding. Under this impression they departed one by one, looking upon both the telegraph and myself as something, as the Scotchman would say, “uncanny.”—*James Gamble in the Californian.*

#### Organizing a Telegraphers' Society.

Since the suggestion made in these columns a few issues ago, that the members of the fraternity draw together and form a little “consolidation” of their own—“an organization which, without the aid of grip-signals and dark lanternism generally, will purify the profession, and lift it above the level of the common store clerk”—we have received many letters favoring the proposed association. We are glad to notice also that, in addition to the efforts in progress by the Erie operators to form a railroad telegraphers' association the commercial operators of this city have already taken the first step in the forming of such a society.

At a meeting of prominent telegraphers, assembled May 7, in the parlor of the United States Hotel, over one hundred being present or represented, it was decided to organize a society to protect the interests of the fraternity. A general discussion took place, in which it was demonstrated that the path of the operator is a downward one.

A committee of nine was appointed to draft constitution and by-laws, which will be presented at the next meeting—on Saturday afternoon, May 22—for adoption. It was decided *notto* have a supreme headquarters, but to be divided into small bodies, say 50 members each, each body to have an advisory committee of three members, who will meet twice a year, to exchange views on matters pertaining to the society's welfare. It was also decided to make it an open society, secret ones having proved failures. This programme met with unanimous approval, and a general invitation was extended to all interested to be present at the next meeting.

#### Sioux City to St. Paul by Hand-Car.

Mr. H. C. Hope, superintendent of telegraph on the Chicago, St. Paul, Minneapolis & Omaha line, has just made the trip from Sioux City to St. Paul on a hand-car. The overflow of the rivers had washed out the telegraph poles at different places all along the line, prostrating the wires and suspending communication. In order to restore the lost connections, Mr. Hope, with two repairers, left Sioux City at 3 o'clock on Sunday afternoon, April 24th. The party stopped wherever there were breaks, and with the assistance of the forces of line repairers at the nearest stations made all the necessary repairs. They found the track still secure nearly all the way through, but in many instances passed through long stretches of water, which was nearly up to their waists as they stood on the platform of their car.

At Mankato they found the Minnesota River up on the main street, in front of the Mankato House. In a great many houses in the west end of the city the water was flowing in at the windows. At St. Peter the river extended from bluff to bluff. The high water track of the road was overflowed, so great was the rise. Mr. Hope had to build a mile of telegraph wire along the bluffs south of the town in order to restore the communication. The depot was flooded and appeared to be in the middle of the river, so extensive was the expansion of the stream.

The party reached St. Paul on Thursday afternoon, April 28, where they received the warmest commendation of the officials of the road for the energetic and intrepid manner in which they had performed the arduous service.

#### The American Cables Under Way.

The cable steamship *Faraday* left the Thames on the 6th inst., at 1 P. M., having on board nearly 1,000 miles of the new cable, constructed by Messrs. Siemens Brothers, for the new American cable company. She passed the Lizard, off the coast of Cornwall, going west, last Tuesday. Mr. Brittle is in charge of the work.

The *Faraday* will first lay the shore end off the English coast, and then cross over and lay the shore end on our coast, where she may be expected toward the end of next week. She will then return, take on the deep sea portion, and pay it out as she crosses a second time. It is hoped that this cable will be in working order by the middle of next month. A sister cable will then be laid, which will probably be working before the 1st of November.

This will most likely inaugurate a lively competition with the English cable monopoly, and insure a reasonable tariff to the general public.

#### A Pilgrimage to a Notable Grave.

MAGNIFICENT MONUMENT TO A DECEASED SUPERINTENDENT.

To the Editor of *The Operator*:

SIR: The operators of the Philadelphia, Reading & Pottsville Telegraph Company may well be proud of their action in erecting to the memory of their late Superintendent, Calvin T. Sellers, the handsomest monument ever placed over a telegrapher, and certainly the most perfect piece of sculpture ever executed to illustrate a telegraphic subject. It was to see this monument that I, at the invitation of some of the operators of that line, recently made a pilgrimage to Reading; and, believing that not only does it reflect credit upon the grateful hands that raised it, but also upon *all* telegraphers, I have written, Mr. Editor, for your columns, if acceptable, a brief account of its peculiar appropriateness, beauty and costliness.

It is now three and a half years since Calvin T. Sellers, the youthful superintendent of the P. R. & P. Telegraph lines, died, but the recollection of the great outpouring of sympathy and the numerous tokens of affection and sorrow is still fresh in the minds of those who remember the occasion. Few then present can have forgotten the seventy-three carriages filled with sorrowing telegraphers and railroad men of all grades that followed the hearse to the cemetery where the interment took place with imposing masonic ceremonies. The esteem in which this young man was held by his subordinates was strikingly illustrated when, after his death, two operators in Reading met, constituted themselves into a committee on floral offerings, and were immediately overwhelmed with offers of money from all sides. In 24 hours over \$200 in money had reached this committee. In addition to the money thus forwarded many places sent their own designs. Pottsville, Williamsport, Philadelphia and adjacent towns sent magnificent offerings of flowers in design as various as the florist's art could devise. Among them were: From Reading, in white flowers, a switch and a Morse key; from the Central Division, a telegraph pole standing in a bed of flowers, with the broken wire dangling its ends among the lilies and tube-roses; from the Schuylkill County operators, a cross and pillow of white flowers, bearing the inscription, “At Peace;” from the operators of the Philadelphia and Norristown branch, a column of white flowers, four feet high, with a pillow base; from the Philadelphia operators of the Chester branch, main line to Bridgeport, a white floral globe on a floral pedestal, three feet high; from the operators of the Catawissa and Williamsport branch, a pillow and cross, and standing column, over three feet high, inclosed in a glass case; while from other points came cross and crown, broken lyre, anchor and other designs in flowers, to denote to the aged mother the esteem in which her dead boy was held.

But it was in their subsequent action—in the lavish expenditure of money to secure a fitting monument and the artistic execution of their design—that these warm-hearted operators showed what gratitude can do for one who has made himself beloved. Indeed, to intrude a selfish parenthetical remark, I might say that no

one who is half-deserving need feel himself neglected among such a body of telegraphers—a fact which was again demonstrated in the cordial reception and royal treatment accorded to myself and a fellow pilgrim to the grave of Calvin Sellers. Nothing was spared in ministering to our comfort, and in leaving us no room to doubt the hospitality of Reading; while to Assistant Superintendent Adams, of the P. R. & P. T. Co.; Mr. Fred. H. Gartlan, the manager, and an old operator known equally as well and favorably on two continents, and Mr. Wiand we are particularly indebted for a sense of courteous treatment received.

A drive of a mile and a half out of Reading brought us to the Charles Evans Cemetery, where, in a sequestered spot overlooking one of the finest valleys in the State of Pennsylvania, repose the remains of Calvin Sellers. Here we found the monument over our dead friend, which we had come so far to see, and saw it under the most fortuitous circumstances. In a quiet spot, with lovely weather, the fresh green leaves recently budded; Nature just assuming her greenest hue, and clusters of violets peeping from underneath the hedge-rows; with the robins in the neighboring trees piping their first simple songs of Spring; with the fair valley beneath, where it takes but a faint stretch of imagination to see "the lowing herd wind slowly o'er the lea;" and with such well-informed and intelligent guides as Messrs. Gartlan, Adams and Wiand, we missed none of the sacred beauty of the sculptor's art nor of the lovely surroundings of this peaceful God's Acre.

The Sellers' monument is a column of pure white marble, twenty feet in height clear of the base, four feet six inches square at the bottom, and surmounted by an urn. The inscription reads as follows:

CALVIN T. SELLERS

DIED

November 24th, 1877,

AGED

34 years, 4 months, 22 days.

ERECTED

BY THE TELEGRAPH EMPLOYEES

of the

PHILADELPHIA AND READING RAILROAD COMPANY,

As a mark of respect

To their lamented

SUPERINTENDENT.

Beneath this inscription, clean-cut and perfect in the marble, are the symbols of our profession. There are—as distinctly as though they were both about to answer, "I, I,"—a relay and sounder, while beside them is a key, which you feel impelled to grasp. The minute details—the spiral spring on the relay, with the delicately-knotted thread that connects it to the binding-post; the thumb screws, with the "milling" on their edges so perfectly imitated; the wires through the binding-posts, with the insulating material apparently roughly shaved off at the ends, and the armatures so finely adjusted yet showing to the professional eye that the circuit is "open"—broken, possibly, forever—make one doubt that it is really the work of the chisel and mallet, and it is only after a close inspection of the marble that he is convinced of the sculptor's consummate art. Beneath this piece of work, cut also in the same block of stone, is a scene in bas-relief, showing the railroad tracks running on the banks of a river, with the wires, insulators and posts, and the mountain scenery as clearly depicted as they would be in a steel engraving.

When the operators first asked for estimates for this grand work, offers were made by Philadelphia and other artists, but none was less than \$1,500. The task, however, was finally undertaken by a Reading sculptor, who felt a local pride in executing it at actual cost price, and it was finally done for \$1,000. Then willing hands carried sounder and key, and relay and bits of wire daily from the telegraph office to the artist's studio, and for three months eager eyes watched with professional keenness the progress of that piece of telegraphic sculpture. The result was a splendid and true representation in marble of our bread-winning implements, and a monument, creditable alike to the noble dead and the noble donors. Calvin Sellers was a king of men, but his late associates have proved that they were well worthy of his confidence; and the reverent manner in which they stand beside the "storied urn" that crowns his tomb, and tearfully whisper to the wandering stranger of the

knightly qualities which endeared the deceased to them, show that the time has not yet arrived when kind or even fair treatment is thrown away upon telegraphers; and that in impartial and just rulings a chief may endear himself to his men for all time—in death even stronger than in life. When robed in office it is loyalty which makes them rally around him; but it is pure affection that leads them thither when the lamented chief slumbers beneath the violets in the seclusion of a rural churchyard.

WERNER.

### What Might Have Been, and What Is—A Very Short Chapter of Recent Telegraphic History.

To the Editor of The Operator:

SIR: It is not necessary to go back a great many years in recollection to enable us to reach the time when the present General Manager of the Western Union Company held a position in that same corporation analogous in many respects to that which he has but recently resumed after so many changes.

In looking over the field since that time to the present a great many things become clear and transparent that were at the date of occurrence shrouded in doubt and mystery. Motives for many acts are becoming more and more apparent. Objects intended to be accomplished; results sought to be attained; promises of all kinds made and kept, or otherwise, as the case may be, crowd upon the mind, and in the light of the latest developments each one assumes its proper proportions in relation to the whole, and drops into its proper niche, in completing the present form of the structure.

At the time already spoken of, the then head of the Western Union was a man of will and character, who was thoroughly conversant and familiar with the practical working of the institution. He was eminently qualified in every way for the position. Those who surrounded and supported him were men of like calibre, the very foremost of whom was he who has to-day practically taken up the line, where, to the regret of all, it was so suddenly and unexpectedly dropped by the firm hand that had securely and safely guided it up to that time.

The causes which led to the separation between these two were a matter of public record and need not be further entered into here beyond a

The present general manager is well-known to be a man of energy and activity, and when this much is said it will be readily understood how irksome his position as president of the Atlantic and Pacific must have been with the talented young vice-president as his superior officer.

Such was the state of affairs up to the time when General Eckert's contract with the A. & P. expired; that is, from the time of the pooling arrangement, the talented young vice-president had everything his own way. It was a noble prerogative, and ignobly he used it. The history of his régime will not be soon forgotten. Then, however, the clouds began to appear in the sky, the wind began to rise; but the ship was staunch and firm, and the captain was not afraid.

Brave youth!

The vessel he commanded had a monopoly of the trade in which she was engaged. The people had to purchase the cargo at the price set by the owners. They might protest if they wanted to; that was their privilege, but they must pay the price all the same.

Soon the American Union vessel appeared in the offing, and started in vigorously to secure part of the traffic.

No compromise was her motto.

She would never haul down her flag, and she hasn't.

The public were to—but, perhaps, it is just as well to maintain silence in this respect.

Well, to resume, a good many of the most experienced officers and crew went into the service of the new craft. Her success was in-

He was young, as has been already said, and was entirely innocent of all knowledge or experience pertaining to the business. He had views, however, such as they were, and he had a policy, a financial policy, that was to take the shape of an executive committee, with himself as chairman, to which committee all expendi-

tures in sums exceeding a dollar and a half or thereabout must be sent for approval.

By an astonishing unanimity of feeling no bills were ever approved by the Committee, except those cutting down expenses, reducing salaries, and paying for their own services, at the rate of six dollars an hour while they sat. The success of the policy was great. Large and steady dividends were paid.

It was a good plan for a short cruise.

What if the sailors and subordinate officers looked on with alarm, and began to grumble at the kind of treatment they received. Old tars who had weathered many a storm, and whose experience would have been of inestimable value in consultation, were ignored.

It was fair weather in the open sea, fine breeze, and no other craft in sight. What matter if the captain was ignorant of navigation. Any ordinary land lubber could sail the ship easy enough.

Sure!

Weak from lack of sustenance, in the form of ducats, and its opponent so badly crippled from the same cause, that radical measures had to be applied, and behold, the pooling arrangement was effected, and peace restored.

Singularly enough, this was a contest in which no quarter was given or received by either side, and yet nothing but quarters, it may be said, were received. In telegraphic history this memorable affray will be known by the title of the "twenty-five cents" struggle.

Certain results were to be arrived at by the cessation of hostilities besides that of dividing the profits, one of which was that the late ban-tams should be given seats on the top perch with the rest of the game birds. How this agreement, however, was *not* carried out, is pretty well known.

The situation had, meanwhile, undergone some wonderful transformations in numerous essential respects. The family who had, after the demise of President Orton, the largest interest in the stock, and who, therefore, had the best right to rule, was about this time augmented by the alliance of a brilliant young gentleman to its ranks.

mere suggestion that, perhaps, the real difficulty resulted from a minor difference between two characters equally strong, equally experienced, and each fully convinced of its own correctness.

The war that followed after the parting was long and bitter, and was maintained by the now defunct Atlantic & Pacific until it became so instantaneous and astonishing. Everybody who has been treated with injustice and oppression rejoiced. Bright days were at hand and \* \* \*

The brave youth struggled manfully, but ineffectually, until he ran his vessel on a sand-bar, and the other vessel came to the rescue, and picked him up out of the ocean, where he had madly plunged in his desperation and terror. He is understood to have since turned his attention to the navigation of ferry-boats.

It will hardly do to wind up this article without a slight reference to the principals in the lengthy contest. It is pretty well understood now that if the verbal agreement made at the termination of the "25-cents" struggle, namely, to admit Mr. Gould and his friends into the directorship of the Western Union, had been carried out the American Union of to-day never would have had an existence.

In this view of the matter, it becomes very readily apparent that the organizers of that corporation knew what they were talking about when they said they were not to be gobbled up, and that for this time at least the opposition would not go the way of all previous oppositions, and, sure enough, they haven't.

The cormorant of the past has at last been swallowed, and the Western Union of to-day is only the Western Union in name, and the American Union in fact.

It was a gigantic undertaking, and shows a giant-like power in the planning and executing of the same.

One other thought presents itself. Suppose the position and power held by the late talented young vice-president had been in the possession of an experienced and capable antagonist of the general managers, several of whom could have been readily found, would things have reached their present pass at this time? Under all the circumstances it is not the proper thing to wind up this article with the caption at its head:

"What might have been and what is?"

N. Y., April 20, 1881,

TOM TANGLE.

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, MAY 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

## JAMES NYE ASHLEY.

James N. Ashley, the veteran telegrapher, genial scholar and editor of the *Journal of the Telegraph*, has been laid at rest since our last issue; and in the little churchyard at Greenville, N. J., where he spent some of his happiest days, he "sleeps the sleep that knows no waking."

Mr. Ashley was one of those veterans whose memory should be perpetuated, and whose edifying lives should be held up for emulation. He was a firm friend of the operator, liberal in his views, though mellowed by years of experience, and superior to all wild and fanatical opinions and influences. As the editor of the *Telegrapher* he stood fearlessly to our interests during the Strike of 1870, defended our course with eminent courtesy and propriety, and uncomplainingly suffered more, probably, than any one else from the failure. His telegraphic writings at all times were most instructive, both in their elegance of diction and traits of sound common sense, qualities which never failed him in the twelve long years that, in his editorial capacity, he stood on our lookout through fog and storm to give us the first warning signal when danger approached. The late William Orton, unlike some of the so-called managers of the present day, was a close student of our literature—a fact which may partially account for the great telegraphic chieftain's apparent astuteness in reading our professional character—and he was often indebted to the *Telegrapher* for valuable hints in the delicate management of his vast trust. He was a warm friend and admirer of Mr. Ashley—a good character in itself—and, even when the criticism was adverse to his policy, he frequently expressed his approbation of the modest editor's sensible arguments and amiable qualities. If the late Mr. Ashley had any fault at all, it was an excusable weakness for being occasionally over-kindly or indulgent in his criticisms of rising young men. But he was fearless and uncompromising in his opposition to mismanagement, tyranny and oppression in every guise. He never hesitated to trace an evil or an abuse to its source and call the perpetrator to account. Many of the most important reforms which have been made in the service are traceable directly to his personal influence—an influence largely due to his sound judgment, inflexible integrity of character and profound fidelity to his own convictions of truth and justice.

Though he had accomplished so much and had seen the telegraph grow from its earliest infancy, Mr. Ashley was still a comparatively young man—younger than some of us who are still successfully beating back the approaching Shadow.

While past the spring-time of life, feeble age had not yet come upon him, and to the last he displayed all the freshness, vigor and gaiety of youth. His life was not worn out, but simply closed like a flower at sunset.

His loss is keenly felt by the profession at large, but still more so by those who were familiar with his noble and chivalric character, who have been guided by his softening and refining influence; who have for years sat at his feet, so to speak, to drink in eagerly his liberal and inspiring outpouring of thought. There was a subtle charm in his method of composition, and intense feeling in his pleas for justice; indeed, some of his literary essays were like sweet melodies, and seemed to lack but the accompaniment of the lute. But the Minstrel has at last written his final rhapsody; he has warbled his swan-song, and peacefully passed away,

"As a child in its cradle sinks to sleep,  
When evening's earliest shadows creep,  
Smiling, as if still at play."

If that English improvement on the telephone which they have elected to call an "electrophone," proves to be as perfect as the cable dispatches represent it, there can be no doubt of the universal adoption of the telephone on deep sea cables as well as on long land lines. The enthusiastic inventor maintains, so the cable tells us, that it is just as easy to talk across the Atlantic as from one room to another. It is by many supposed that the "electrophone" case of ocean cable conversation is the first instance of the kind on record. This, however, is a mistake. In Count Du Moncel's work on the telephone, published in 1878, it is distinctly stated that articulate speech was in that year transmitted through the cable between Guernsey and Dartmouth, a distance of 60 miles. Mr. Preece, of the British Postal Telegraphs, also conversed in the same year over the cable between Dublin and Holyhead, a distance of 67 miles. The telephone under its ordinary name was, in both cases, the instrument employed. By a curious coincidence, while this new "electrophone" is being tested between England and France, a company is being formed on this side of the ocean to utilize the invention of Robert M. and William Lockwood in improved telephones, "based on the principle of molecular disturbance and the suppression of all vibration." By this process a whisper in New York is distinctly heard in Philadelphia, and it should not be surprising if this "electrophone" turns out to be the same idea. The various inventors, however, can settle that question among themselves. It is enough for us to know that the telephone is realizing all the predictions made concerning it.

THERE can be no more touching marks of devotion than those paid by sorrowing hearts to the memory of a dead chief, for it is then, if ever, that an oppressed subordinate may safely cast aside every unworthy incentive to be liberal. In the death of Calvin T. Sellers, the toiling operator lost one of the truest, the best, most indulgent and just superintendent's that ever had charge of a district. His men, who fairly idolized him, were not slow in testifying to their affection, and in making his record enduring in marble; and we take great pleasure in describing the noble monument, through a reverent pilgrimage to the spot, made by our correspondent, "Werner." Telegraphy in general has produced, and is still disgraced by, some of the meanest white men

ever placed in official positions; while, on the other hand, we can boast of some of the truest, the gentlest and the most enlightened. But the unworthy are inevitably unmasked and the true-hearted and brave must, sooner or later, find their guerdon in the unmelting loyalty of an overwhelming multitude. A better example of the unquenchable affection of men for Man could not be given than is found in that shady dell in the Schuylkill Valley, near Reading, and inscribed on the marble monument erected by sorrowing telegraphers to the sacred memory of Calvin Sellers.

NEXT Thursday the Western Union athletic games will take place at the Manhattan Club's grounds, and the "boys" are consequently on the *qui vive*. These games are good for the health, and indirectly for the better working of the service, and should, if properly conducted, be well patronized. There is no antagonism between intellectuality and reasonable athletic training and exercise; indeed, the latter rather promotes the former. Some of the greatest leaders of the world, such as Richard I. (Cœur de Lion) of England; the Roman Emperor Maximus, and Scanderberg, four centuries ago King of Albania, were all famous athletes; while the Olympic and Pythian games were classed among the greatest events of the year. The records made by telegraphers last November—the one mile walk by D. C. Donohue in 7:57½, and the three-mile walk by the same gentleman in 25:48; the half-mile run by W. B. Waycott in 2:24, and the five-mile go-as-you-please, in which T. Marrin covered the distance in 30 minutes 41 seconds—were all highly creditable, and must serve to increase the interest felt in the coming events. We wish the boys fine weather, much enjoyment and good records; and if some of the entries prove to be as fleet of foot as they are dextrous in handling the key, we shall not be disappointed.

IN our issue for February 15 we printed a copy of a letter written by Professor Morse, May 24, 1845—just one year after the first message was transmitted—in which he expresses the hope that the receipts of each office will soon mount up to at least five dollars per day. These old documents throw much light on the rise and growth of telegraphy and electrical science. We are, therefore, glad now to call attention to another old letter (in the possession of Mr. Latimer Clark) exhibited in London on the 11th ult. It was written in London on Dec. 15, 1716, by Sir Isaac Newton, and addressed to Dr. Law, who resides in Suffolk. The remarkable thing about this letter is that Newton seems to have anticipated Franklin's great discovery. The passage touching upon this point is as follows: "I have been much amused by ye singular phenomena (the word phenomena is written in Greek characters) resulting from bringing of a needle into contact with a piece of amber or resin fricated on silke clothe—ye flame putteth me in mind of sheet lightning on a small (how very small) scale. But I shall in my epistle abjure Philosophy whereof when I come down to Sakly I'll give you enow."

AT last the laying of the projected "American Union" cable has been commenced, and the arrival of the *Faraday* off our shores about Friday next will be the first substantial intimation to Great Britain that her monopoly of the cable business is to be broken. There seems to be no

foundation at present for the rumor that an arrangement has been entered into by which the American cable company will not compete with the existing cable companies. This is just as it should be, and if our new cable company will charge the lowest possible fair rate it will have all the business it can handle. This was demonstrated during the prevalence of low rates, some months ago, when the Western Union kept a quadruplex and duplex at work night and day to North Sydney, and a quadruplex to Duxbury, carrying messages for the ocean lines. This immense volume of business can be retained by adopting a fair tariff—say, twenty-five cents (one shilling) per word.

By the death of Mr. Ashley, THE OPERATOR has had one more exclusive duty imposed upon it, namely, the making of our history and the handing down to posterity of the record and character of Colonel This, and General That, and Judge The-other—in fact, of Tom, Dick and Harry. It is primarily the duty of the grubbing newspaper man to collect and print all the fugitive odds and ends of life. Then, after the lapse of years, comes the professional historian to read the bound numbers, to dilate upon this thing and expatiate upon another, and in fact to “notch the centuries in the eternal rock.” As a matter of fact, THE OPERATOR has already made a trifling notch or two in the eternal rock on its own account, but since we are called upon to take up the lines where Mr. Ashley left them, and to embalm the record of friend and foe alike in the art preservative of all arts—cold type—we shall endeavor to be as discreet, just and courteous as he was.

THE stringent laws with regard to underground wires now being passed in some cities, particularly Chicago, are decidedly unfair. The existing monopoly, which has already strung all the wires which it needs, thus gains an advantage over its competitors struggling into existence, which, under the new rules, must lay subterranean wires. It is a proverbial fact that there is no thicker head than that of your average city alderman, and their reputation for downright stupidity will not suffer in the matter of ordering telegraph wires underground. All the existing companies should have reasonable (at least two years') notice; and provision should also be made for the much-hoped for, but as yet unborn, “opposition.” Anything else will put an end to the progress of American telegraphs and telephones, and will guarantee to the existing company that which they most sigh for—a monopoly.

THOSE who are living on fixed salaries are just about beginning to feel the effects of the rise in real estate and the consequent rise in rents and enhancement of values of all kinds. Many employers have recognized this fact by promptly acceding to fair demands on the part of their employes for increased wages. In telegraphs the salaries seem to have, where they vary at all, a downward tendency; although a modest but firm remonstrance might have a stiffening effect on the market. Since our English professional brethren have set us an example of dignity and firmness, it might not be amiss for us to examine into the nature of our prospects.

It will be thirty-seven years next Tuesday week since, on May 24, 1844, the first dispatch ever transmitted by a recording telegraph was sent from Washington to Baltimore, Prof. Morse

being in the chamber of the Supreme Court, at Washington, and the receiver, Mr. Alfred Vail, at the Mount Clare depot, Baltimore. The exact date is given upon the authority of Mr. Field. In this, the wire age, we can better appreciate the text of that brief message dictated by Annie Ellsworth, “What hath God wrought.”

Is it not a little unpatriotic for “American” cable companies to have their cables manufactured in England? Of course, if we go abroad at all for good workmanship, we can obtain most satisfaction from the well-known firm of Siemens Brothers; but are there no American firms capable of doing equally as well? It might be a good idea for some of them to make a bid in connection with the projected Pacific cables, and then, if our capitalists will patronize home industries, we may have a veritable “American” cable.

Now that we are to have our own cables, we hope that our managers will see that they are worked at both ends, in Europe as well as in America, by American operators. Independently of the fact that better work can thus be obtained, and that provision can in this way be made for many worthy operators, it will be only following the precedent set by the foreign companies, who have always exported their operators to do their signaling on this side.

In a recent issue we advocated a competitive trial of the various systems of electric lighting. It seems now certain that the electric light will, in a few years, entirely supersede gas. In London the question has been put to a practical test by introducing several of the best methods under an arrangement which prolongs the opportunity for comparison throughout an entire year. Which of the many electric light companies now established here will be the first to issue a challenge for a competitive trial?

THE coinage of new words made necessary by the rapid progress of electrical science is at last attracting the attention of, and in some cases protests from, our lexicographers. The word “cablegram” is now under criticism, as it violates the alleged law that a compound derivative word must have all its roots from the same language, and “spartogram” is suggested by the philosophers as a substitute. “Cablegram” is good enough for us.

THE insurance companies are now threatening to rate all buildings using the electric light as “specially hazardous,” unless the insulation of the wires is properly approved. Their fears arise from the danger of fire in case of a cross between the electric light and telephone wires.

WE regret that the cuts to illustrate the exhibit of Messrs. C. E. Jones & Bro. at the telephone convention were not even ready for this issue. These and cuts of the switch exhibited by the Utica Fire Alarm Telegraph Company will, however, appear next issue.

OWING to the pressure both of reading-matter and advertisements, we again present our readers with a 20-page paper.

WESTERN UNION stock is quoted at 118 $\frac{3}{8}$ ; American Union at 85 and A. & P. at 51 $\frac{1}{2}$ .

#### Professor Carhart's Lecture.

The lecture of Professor H. S. Carhart at Cooper Institute, on Thursday evening, May 5, was very fairly attended, and many of the experiments elicited enthusiastic applause. It was not, however, of such a character that a full report of it would be read by any considerable number of OPERATOR readers, while it would be difficult, if not impossible, to illustrate the experiments with newspaper wood cuts. For these reasons we must content ourselves with the following synopsis:

Professor Carhart first explained the difference between the solid, liquid and gaseous states of matter, and then announced the theory of a fourth or ultra-gaseous state. In solids the molecules were held together by cohesion in such a manner as to furnish a powerful resistance to any alteration in the form of the mass; in liquid their evolution or oscillation was so comparatively easy that pressure was transmitted in all directions; in gases the constant collision of molecules with each other was believed to be the source of their pressure against the sides of the vessels in which they were contained. But the free path of the molecule even here was, as compared by Mr. Clerk Maxwell, only one two-hundred-and-sixty-thousandth of an inch, while the distance between any two molecules was only one seven-millionth of an inch according to the same brilliant mathematician. By experiments with high vacua, exhausting the air in tubes to one twenty-millionth of its original density. Prof. Crookes discovered a form of matter in which the molecules were so far removed from each other that their impact could be studied in its purely physical relations—a form so attenuated that the collision of the molecules was reduced to a minimum. The wonderful ingenuity he had shown in visualizing the movements of these infinitesimal bodies, as well as the originality of the conclusions he had arrived at, was one of the remarkable advances of modern science. This new form of matter Prof. Crookes had styled radiant or ultra-gaseous. Prof. Carhart's experimental illustrations of the subject were conducted by passing electrical currents through Geisler and Crookes tubes, the former of low and the latter of high vacua, showing that gases phosphoresce under the action of the current in a manner entirely different from the ultra-gaseous ether forming the fourth state. In the latter, the phosphorescence of the tube under passage of the current was shown to be due to propulsion of streams of particles against the internal surface of the tube, and to be confined to the glass itself, not a property of the contained matter. In the former, on the contrary, the stratification of the contained gases was exhibited, and the light demonstrated to be due to the collision of gaseous particles. By introducing caustic potash into a supplementary tube and heating it with the flame of an alcohol lamp, thus causing it to part with its aqueous vapor. Prof. Carhart slowly transformed ultra-gaseous into gaseous matter, the phosphorescence of the glass under the impact of particles gradually giving way to the stratified luminosity observed in Geisler tubes when the current passes through them. By using a cup-shaped negative pole he concentrated a stream of particles upon a platinum button suspended in a vacuum tube until it was heated to incandescence by invisible means, the bulb remaining perfectly cool. His last experiment was to run an engine in a Crookes tube by means of shifting the poles of the battery rapidly from one of the tubes to the other. “We have now touched the border-land,” remarked Professor Carhart, in conclusion, “where matter and energy pass into each other, and have arrived at the ultimate particles of which the universe is composed—an achievement which will, in the end, I believe, enable us to solve the subtlest problems that science presents to us.”

## Notes from the Oil Regions.

To the Editor of The Operator:

SIR: This is indeed a season of many changes and surprises to the telegraphic fraternity throughout the country, and Oil City, which for a number of years has been an important point, has just realized its full share. The American Union boys for the past month or more have been on nettles, as it were, hourly expecting to be gobbled up by the great monopoly, and even the Western Union force have at times appeared a little uneasy as to the final result, each eagerly and anxiously watching the "little indicator" to see what might be their loss or gain. The surprise was as sudden as it was unexpected. On March 31 we were informed that on and after that date the Western Union Telegraph Office at Oil City would be no more, and that Mr. M. E. Luce, our genial Manager, would quietly step down and out, to be succeeded by Mr. W. A. Drake, Manager of the American Union; that all wires and office furniture would be transferred to the A. U. office. We were also instructed to report for duty at that office the next morning, April 1. Surprise and, in fact, consternation, would not express our feeling at this sudden denouement. It seemed as though a cyclone of no small proportion had struck us. This startling announcement, however, was well founded, and as soon as business would permit the work of removing tables and running wires was begun, which proved an all-night job. It was ably managed, however, under the supervision of Circuit Manager Ross, assisted by linemen Webster, House, Shaw, and others. The Western Union force, as instructed reported for duty at the American Union offices April 1st and were well received by the new Manager, Mr. Drake, who soon found plenty of work for us all.

The appointment of Mr. Drake as manager is a worthy one. Although a young man, Mr. Drake has shown very marked ability as a manager, and there is no doubt but that he will fill the position with perfect satisfaction to all concerned, and add fresh laurels to an already enviable reputation.

Mr. Frank Ross, for the past two years assistant manager of the W. U., has received the appointment of circuit manager, and to have charge of the working force. Frank is well qualified for that position, and will have Mr. S. M. McKee as assistant.

It is a matter of no small regret that Mr. Luce leaves us to return to his "first love," Titusville, where he continues as manager of that office.

The following excerpt from the Oil City *Derick*, of the 7th inst., will give a good idea of the volume of business handled in a day at Oil City:

"The business of the telegraph company yesterday was reported to be larger than on any day in the history of Oil City. As messages on the Exchange frequently run into the thousands, yesterday's business must have been immense. Oil City's telegraph business will rank second to no single office in the State."

The number of messages handled on the day above mentioned was in the neighborhood of six thousand, the Bradford quad alone handling 1,350.

The following comprise the present force, several of whom are well-known telegraphers: Mr. W. A. Drake, manager; Mr. Frank Ross, circuit manager; Mr. S. M. McKee, assistant; Messrs. H. W. Rathbun, E. A. Keene, Jr., J. B. Skelly, P. M. Brigham, E. Jeunett, George Ross, Jr., A. J. Mercer, E. Hatch, C. C. Klumph, J. H. Gross, W. B. Case, operators; Mr. M. Keating is receiving clerk, while Mr. Frank Thompson and his accomplished wife look after the books. The office boys and messengers number nearly a score.

Oil City office is now under the control of Mr. D. O. Wickham, superintendent of the American Union headquarters at Titusville. While we, the old Western Union boys, will miss the kind, fatherly care of our old and much-esteemed superintendent, C. O. Rowe, we are content to know that our new superintendent is an able officer as well as a pleasant gentleman.

Mr. P. W. Brigham, one of our brightest lights, was married to Miss Aggie Vensel, of St. Petersburg, March 16.

OIL CITY, Pa., April 10, 1881.

Q. E.

## Jottings from the L. S. and M. S. Railway.

To the Editor of The Operator:

SIR: This being one of THE railroads of America, and THE OPERATOR being a decided favorite with the operators on this line, I have often wondered why some of our operators, especially those who make pretensions to literary attainments, have not ere this availed themselves of the opportunity which your brilliant sheet offers of rescuing so worthy a portion of the telegraphic fraternity from obscurity.

We have in our ranks a complete variety of telegraphers, from the nervous "plug" up. There are those who (their story for it) have clambered up the lofty summits of the "Rockys" and "Sierras," who have gazed upon the tranquil bosom of the Pacific, who have listened to the loquacious "Dennis" at the "sand lots," who have drank in with bated breath the grandeur of the "Yosemite," and who have—it may have been for their love of out of door exercise, or for reasons best known to themselves—walked from Santa Fe to Buffalo. There are others still who have crossed the Atlantic, and whose footsteps have echoed through the grim dungeons of London, and the classic hills of Rome, and the palaces of Florence; and who, like Mark Twain, have made the ascent of Mont Blanc—in their mind—and whose never-ending loquacity will, in spite of our endeavor to think charitably, suggest the thought that they even now consult the guide-book which is ever peeping from their pocket, when it were better for them to call to memory the decalogue and its divine precepts. Again we have those who are striving for the appellation of "M. D.," while one or two are delving in the intricate avenues of forensic lore, with a determination and energy beautiful and inspiring to behold, and which, no doubt, will eventually place their names high upon the scroll of fame. Why not, if they but emulate the example of some of their distinguished predecessors?

On the whole, it seems to me that among all these erudite gentlemen there ought to be some one spirited enough to write up our affairs in a manner worthy the columns of THE OPERATOR, which would be appreciated by us all. In taking the initial step I do not wish to convey the impression that I am egotistical enough to entertain the idea that my own pen is adequate. I only offer it as a gentle reminder to those well-known for their pedantry.

I append a few personals: Mr. E. H. Abbott, of Silver Creek, is recuperating his tired frame after a long battle with "Ky" and the past winter. Mr. E. P. Clohessy fills the vacancy. Mr. Thomas Cassity has resigned his position as agent and operator at Irving, and Mr. John McCruden, of Angola, has been appointed in his stead. Mr. George Reed, of Cleveland, pays a flying visit to Buffalo occasionally.

EASTERN DIVISION.

HAMBURG, N. Y., March 28, 1881.

## Erie Notes.

To the Editor of The Operator:

Sir: The most elite affair of the season at Pater-son was that of the Telegraphers' reception and ball on the 20th inst. Great credit is due to those who worked so zealously and ably to perfect arrangements and carry out such a truly enjoyable affair. We suggest, however, that the next one be held somewhat earlier in the season. Mr. George Holbrook, Secretary *pro tem.* of the proposed Telegrapher's Society, started for the Hot Springs, Arkansas, Tuesday, the 26th inst. Mr. Holbrook has been in ill-health for some time past, and visits the Springs in the hope that he will be greatly benefited, if not wholly cured. His many friends wish him a pleasant trip, complete recovery and a speedy return. During his absence, all communications relative to the proposed society should continue to be addressed to him at Provost and Tenth streets, Jersey City, where they will receive prompt attention. Any one desiring to meet members of the committee during Mr. Holbrook's absence can always do so by addressing him. Mr. W. H. Owen, mention of whom was made in a previous issue of THE OPERATOR as having accepted a position as train dispatcher with the Cairo & St. Louis Railroad, St. Louis, Mo., has returned to his many friends in the East, the position which he was about to assume not prov-

ing entirely satisfactory to him. He is now Manager of the W. U. city office at Middletown. Mr. W. J. Lipple has resigned his position as Division Operator, and is now with the Pennsylvania Co., this city; Mr. O. F. Gross fills the vacancy. As regards the proposed Telegraphers' Society, the committee express a hope that they will receive more substantial support and encouragement from railroad operators than has already been given them. The committee does not expect lengthy communications from every one. To say that it meets with approval, and promising further support when organizing, is all that is asked. Those who can, and feel so inclined, are requested to express themselves at as great length as they choose, making suggestions. These will decide the course to be pursued when the time is ripe for organization.

As a result of an article in a recent issue of THE OPERATOR, requesting our Superintendent of Telegraph and Division Operators to make a raid upon those offices where students were practicing without the knowledge or consent of those officials, we are glad to be able to state that there has recently been a sweeping out.

We fail to find words with which to fitly express our appreciation of this action on the part of the powers that be. Operators are now and have been for years a glut in the market. Every operator knows this, or, at least, should know it, and it seems strange, in view of this fact, that our superiors in office should be requested now and then to put a stop to any further addition to the ranks. Just what amount of respect it is expected an operator, acquainted with this state of affairs, can have for another who barbers away his prerogatives at the expense of his fellow operators is more than I can comprehend. It does, indeed, seem strange that the necessity for such mention should exist.

ERIE.

JERSEY CITY, N. J., April 27, 1881.

## Boston Notes.

To the Editor of The Operator:

SIR: Mr. Geo. F. Milliken, who resigned his position as manager of the W. U. a few weeks ago is reported to be connected with the telephone company in this city. Mr. D. D. Devereux, city line inspector, has resigned. Mr. J. W. Duxbury, who was Asst. Supt. and district inspector, resigned, and has been appointed Supt. of the Providence Telephone Company at Providence, R. I. Geo. D. Colgrove, Howard M. Breen, Geo. Rideout, Frank Davidson, several in the clerical department, and a few of the line men have resigned.

Mr. Thomas Roche, the newly appointed Superintendent of the Eastern District, *vice* C. F. Wood, has risen from the operating table to his present position through hard and diligent work. He was notably connected with the Atlantic & Pacific Company here, and instituted a stirring competition with the W. U. After the consolidation of that company with the W. U. he was made Superintendent of the American Union, where he continued to discharge the functions of his position in a manner highly satisfactory to the public and general management of that company; consequently his advancement.

Mr. C. W. Henderson is Chief and acting as Manager of main and branch offices. F. Scott Smith, formerly Chief of A. & P., this city, is working New York quad nights. Steve Sullivan and C. J. Sullivan, from the A. & P. and American Union, respectively, are also on the night force. Ed. Holden, from the A. & P., is here on days.

Business is good, and will increase steadily. A large volume of "red" and specials are handled at night. Under the excellent management of Night-Manager Leighton, every man is kept steadily at work. The facilities for handling Western business are now very good, having through circuit to Chicago, which is something new.

The base-ball fever is breaking out in the office. Tom Kelly is growing enthusiastic, as usual, over his pet game, and it is hoped that he will induce some of the others to follow him. It is a well-established fact, particularly known to the New York boys, that we can boast of a tolerably good nine.

UKNO.

BOSTON, Mass., May 11, 1881.

## Chicago Notes.

To the Editor of The Operator:

SIR: Business, telegraphically, continues to boom hereabouts in a way exceedingly lively and entirely unexampled by any previous season's record. Nearly every operator—especially those who are capable, whether able or not—is worked to the utmost of his endurance, night and day; and serious complaints of weariness from overwork are becoming common on every hand. Constant confinement of those who have been located here during the long, dark winter—of about six months—only just fairly ended, has rendered many operators physically unfit for the excessive and enervating tasks now necessarily imposed, and it is believed that by mid-summer, or even earlier, a great number will be compelled to fly from the office for a while in order to regain lost strength and health; and thus put the company to more trying straits than ever.

Your correspondent does not share in the opinion of many that this rush of business is spasmodic and to prove unlasting, but believes it an entirely natural outgrowth, which will continue little abated for a long time to come. The mighty growth and spreading enterprise, commercially and agriculturally, of the limitless West and North and Southwest, insures the belief; and, therefore, the question of increased facilities for meeting the rapidly increasing demand for telegraphic service, should not be a question, but recognized as palpable necessity.

ARRIVALS.—Andy Long, George Richardson (A. & P.); Jim Cooper, Buffalo; Peter Rady and Peter McGill, Toledo; Mr. Swift, Kansas City, and several others whose names we are not able to learn at this writing. First arrival for Mr. Wm. Lowe, a ten pound-boy.

The manager has moved his desk into the operating room, where he can more carefully survey the scene over which he is appointed to preside. Mr. John Boughan, late manager's secretary, has been transferred to the night force.

RESIGNED.—Emmet O'Brien has gone to his home in McGregor, Iowa, to recuperate. Albert Kane has accepted a position upon the Milwaukee & Chicago private line.

## Milwaukee Melange.

To the Editor of The Operator:

SIR: "Make spaces" is the latest adjustment gag.

Nearly every occupation represented in Milwaukee is having trouble with striking employés, except the telegraph companies. Verily, it seems as if the latter should take cognizance of the fact, and voluntarily advance salaries. This suggestion is furnished gratis.

Several quite important changes have been made at 89 Michigan since last issue. Mr. D. A. Henshaw, for many years holding the position of Receiver, has retired, and is succeeded by Mr. T. F. Ramsey, a very worthy recognition of the services rendered by the latter as assistant. The position of assistant receiver is now filled jointly by Mr. Robert Schultz, promoted, and Mr. F. H. Brown, a recent addition. Mr. Henshaw's resignation takes effect on the first of June. Mr. W. F. Moore, of St. Paul, has accepted a position on the Chicago & Milwaukee telegraph force, and is a worthy acquisition. Mr. F. W. McRavey, of the Milwaukee District Telegraph Co., has resigned to accept a railroad position on the St. Paul & Omaha. Mr. B. W. Shove, for the past year employed on the Northwestern day force, has resigned to accept a position on the C., St. P., M. & O. R. R., at Worthington, Minn. His place here is filled by Mr. Looby.

Members of the profession who knew Mr. Jno. F. Gale, will be pained to learn of his death by drowning, as noticed in another column. Mr. Gale had been, until a few days previous to his death, employed by the Chicago & Milwaukee Telegraph Company, this city, and he was considered an expert operator, and had many friends. It is supposed that he took his own life, while laboring under temporary aberration of mind, superinduced by despondency over the loss of his situation and the reported precarious condition of his mother, who had received serious injuries by an accident a short time previous. This is the second Milwaukee telegrapher within a little over a year who has chosen the watery path to "that undiscovered country from whose bourne no traveler returns." Pace. OCTOPUS.

## The A. D. T. and the Mutual District.

To the Editor of The Operator:

SIR: The contest between the Mutual and American District companies for patronage is beginning to assume the form of the ridiculous in certain quarters.

The rival companies have offices next door to each other, between Twenty-second and Twenty-third streets, on Broadway.

Delmonico's, in that vicinity, uses both call boxes when a messenger is wanted.

The calls are very numerous, and in the frantic effort to get there first, Mister Terrell, Manager, and late acting superintendent of the A. D. T. messenger department, stations a boy outside the door of the office with a red lantern, and another boy is to be found perched on the Worth Monument, several yards from the goal.

When the call comes in the red lantern is swung around by the boy at the door; the monumental youth sees the signal and flies.

The Mutuals, it is understood, have organized a system of whistles. They have not yet, however, been able to originate anything half so successful as the red lantern.

Had the A. D. T. Co. shown a quarter of this energy in the past, they would not now have a rival to contend with. How long will such efforts last, and, seriously, is not all such work farcical in the extreme?

What is needed is good constant service, not a spasmodic jump from one extreme to another. The sooner such silly exhibitions are put an end to the better it will be for all concerned.

SOME of the most intelligent managers of the A. D. T. Co. are endeavoring to procure an expression of opinion from their associates as to the advisability of forwarding a petition to the president for a rearrangement of their hours of labor.

The time is opportune, and as they have an undoubtedly strong case, the chances are greatly in their favor. There is one thing they can make up their minds to, however, and that is, that if they remain silent till the company finds out what they want, and then gives it to them voluntarily, they will be first-class mummies before they get it. T. T.

NEW YORK, May 8, 1881.

## Galveston Gleanings.

To the Editor of the Operator:

SIR: It may be of interest to the readers of THE OPERATOR to hear how we are getting along on the "Island." Telegraphically, matters are in very fair shape. We have a good, efficient force, and nothing occurs to mar our pleasures. The writer has worked in many offices, and takes occasion to say that he never had his lot cast among as good hearted, accommodating, and gentlemanly a lot of "boys" before.

Our force now consists, on the day trick, of Messrs. T. M. Skinner, Chief; Judson C. Smith, N. O. duplex; A. Lucas, Dallas and Ft. Worth wire; E. L. Otto, Shreveport and Longview; W. S. Hoskins, San Antonio and Austin, and a large, good-natured man on St. Louis duplex. Night turn, Alex Russell, Chief; T. Pindell, St. Louis duplex; Mr. Moore, night report man; Mr. Church, San Antonio wire; W. D. Howe, Dallas and extra. Mr. Fox does duty at the Cotton Exchange during the day. Our manager, Mr. David Hall, is the right man in the right place. Besides being a thorough man of business and an efficient manager, he endeavors to treat his men with all due courtesy. We are extremely proud of our chiefs, and I can safely say that no more perfect gentleman can be found. They have the deepest regard of all their men, and thus things move along smoothly. Operators are quite plenty in Texas now, for the first time in two years. The railroads all supplied, and quite a number of idle men in the country here. I would not advise any leaving positions to come here unless assured of a place. Salaries are going down all over the State. The "Service Slip" was abolished here to-day. We have had a good pull at it, and we let it go without regret. GALVESTON, Tex., May 1. X.

## Chattanooga (Tenn.) Notes.

To the Editor of The Operator:

SIR: Our present force consists of the following well-known telegraphers, making, as Chattanooga is noted for, one of the best forces in the country: Mr. N. R. Young, Manager; day force; Messrs. Al. Pennock, Chief; Jack Riley, New York duplex; Sam Swartz, New Orleans quad; Homer G. Comstock, Nashville and Atlanta circuits; Charley Skelton, "old man," Memphis single. Night force: John R. Terhune, Chief; Chauncy Raymond, of New York, press Washington circuit; Ralph Saxton, of Pittsburgh, New York duplex; J. W. Burton, late manager A. U. at Atlanta, Ga., "hoops up" southern press nights.

Business has increased 25 per cent. cent since last April, and there won't be any reduction of force this summer, although there may be of salary. We all came here and worked during the epidemic of 1878, and can, therefore, appreciate a cut-down of salaries muchly. The A. U. is still open, with James B. Norris as Manager. Fred Meyer, late of New York, is his assistant.

We expect to move into our new office shortly. E. M. Hickey, who has been in Selma during the fall and winter, is sojourning here now. He expects to go to Mexico soon. Ed. Fullam, of the A. U., Cincinnati, is in the city for a few days. PENN.

## Buffalo (N. Y.) Notes.

To the Editor of The Operator:

SIR: Great changes have been made in telegraphic circles in this city since the close of the A. U. and A. & P. offices. L. M. More, manager A. U., has been transferred to the management of the three companies consolidated at the Dock; A. C. Terry, chief operator, to assistant chief W. U. office. N. H. Perrin (the rusher) is working oil wires; Ed. Abrams and W. H. Stratton, New York wire, days; S. A. Farley, National Press, days; Charley Orr, M. O. Hoffman and Tom Winnett, nights. Messrs. Dennis and Usher, manager and chief operator respectively of the A. & P., are now assistant chiefs in the W. U. office. We now have a force of 71 operators and about 6 or 8 chiefs. The boys on the Associated Press would like to know what they were all doing while Griffin, at Lockport, received those 58 words per minute from Minear. John Agne, of the American Union office, New York, arrived on the 11th inst., and is working the Rochester duplex. Toney Gallagher, of "roaming" fame is with us on the Boston quod. Frank Gardner, who got the Colorado fever about a year ago and left for Pueblo, is again with us. The report is going the rounds that some attraction in the telephone office called him back to Buffalo. Walter Patterson has the South America fever. G.

## Baltimore Notes.

To the Editor of The Operator:

SIR: The outlook for operators just now in Baltimore is certainly not very encouraging. Those thrown out of employment by the recent consolidation are looking anxiously forward to the time when the Mutual Union Company will open up, which, it is said, will be but a few months. A musical and literary entertainment, complimentary to Mr. George F. West, late manager of the A. D. Tel. Co., was given at the Academy of Music April 19. Baltimore's famous elocutionist, Miss Minnie Mosher, read several fine selections. Mr. E. Jungerman, of the W. U., has resigned, and goes to Gettysburg May 1. He was a bright light in the main office. E. H. Cole has accepted a position as operator and agent at Hagerstown, Md. Mr. Walter Stewart, the newly-appointed manager of the A. D. Tel. Co., has resigned on account of ill health and gone South. The duties of his office are performed by the president, Harry Fisher. Mr. E. C. Cockey, a former Baltimorean and now general supply agent of the W. U. Tel. Co. at New York, was in the city yesterday. The Brush Electric Light Company has been incorporated here, for the purpose of lighting the City Hall and other business houses by electricity. EXCELSIOR.

BALTIMORE, Md., April 22, 1881.

## A Decoration Day Suggestion.

To the Editor of The Operator:

SIR: Decoration Day is near at hand. On that day the graves of those who served their

country well will be strewn with flowers, and the statues of men whose memory we love to cherish will be decked with wreaths, as tokens of our remembrance. Would it not be thoughtful and very dutiful in us telegraphers to remember Professor Morse on that day? Subscriptions of ten cents or so from the willing ones would enable us to decorate his statue that we erected in Central Park, and also strew with flowers the grave of the good old man at Greenwood.

G. K. WALCOTT,  
195 Broadway, New York.

May 10, 1881.

P. S.—I have already received several subscriptions, and any others sent to me will be judiciously used for the above object. G. K. W.

## TELEPHONE DEPARTMENT.

Detroit, Mich., has over 900 subscribers to the telephonic service, outside of some scores of private lines.

The Bloomington and Normal (Ill.) telephone exchange has 200 subscribers in Bloomington and Normal, the latter being a place of 2,000 inhabitants, about two miles from Bloomington. Mr. Geo. L. Batchelder is superintendent of the exchange.

The Central Telephone Company has commenced placing poles for a telephone exchange for Streator, Ill., which will connect with two neighboring cities, Ottawa and La Salle. The exchange starts off with 45 subscribers, and new ones are being constantly added.

The Bell Telephone Company, of Canada, have purchased the stock and plant of the Toronto Telephone Dispatch Company. The price paid was \$27,500. Mr. Hugh Neilson, Superintendent of the Dispatch Company, will fill the same position for the Bell Company.

A very interesting experiment with a new molecular telephone, invented by Robert M. Lockwood and his son, William, of New York, was tried recently between New York and Philadelphia, over the ordinary telegraph wires. Conversation, even to a whisper, in Philadelphia was heard with perfect distinctness of articulation. The principle claimed by the inventors is that of molecular disturbance and the suppression of all vibration. A company has been formed to put the new telephone in practical use.

The City Councils of Atlantic City, N. J., have just completed arrangements with the Bell Telephone Company, of Philadelphia, by which the City Hall at that place will be connected with different points in the town, using the telephone for fire and police purposes. A central exchange office will also be located in the tower of the hall, with wires radiating to the principal hotels and cottages, so that in a measure each of those places will also be an alarm station. Atlantic City is the only place along the coast from Maine to Florida possessing this great safeguard and convenience.

The *Evening Telegram* of the 7th instant had the following dispatch from London: "A remarkably interesting experiment has just been made at Calais and Dover, between which places a conversation has been kept up *viva voce* by means of a new kind of telephone, which has been patented under the name of electrophone. Not only were the words whispered into the apparatus at Calais distinctly heard at Dover, and of course vice versa, but the listener at one end was perfectly well able to distinguish by the mere tones of the voice the person who was speaking at the other end.

"The scientific specialists present were astonished at the difficulties successfully overcome in the enormous condensation produced by the metallic covering which protects the cable and in the induction caused by the simultaneous passage of telegraphic dispatches along other wires of the cable. It should be observed that while the human voice was being transmitted through one of the wires, the other wires were being employed for the transmission of ordinary telegraphic messages. Moreover, the experiments were conducted between the hours of ten and four, that is, in the busiest part of the day, when the wires are in unceasing operation.

"There can be no longer any doubt that it is perfectly practicable to converse across or rather under the sea by means of any submarine cable, and the success of the experiment opens up vistas of the possibilities of rapid communication that a few years ago would have belonged to the realms of dreamland alone. The inventor maintains that it is just as easy to talk across the Atlantic as from one room to another, and he has succeeded so well in the first practical illustration of his apparatus that one is scarcely justified in doubting his assertion that he has found out a system by which words spoken from the other side of the ocean can be fixed on their arrival here and treasured up for future use."

The *Free Press*, in speaking of the telephone in Michigan, says that that entire State is managed by one company. No other States are thus managed except Missouri and Wisconsin. Chicago alone has two companies, New York three or four, and all the large cities at least two, while the States are divided into districts with a company for each. At this date Michigan has eighteen telephone exchanges outside of Detroit, and numbers altogether about 2,500 subscribers. This is outside of at least 1,000 private lines. At least 25,000 Wolverines find daily use for the telephone. Two gangs are constantly working on construction.

At a recent meeting of the fire insurance underwriters in this city a report was made of a curious accident to a telephone in a jewelry store in Maiden lane. A telephone is in this store, and the other day, when a man was on the roof running an electric light wire across, it came in contact with the telephone wire, and a flash passed down to the telephone box, melting the annunciator and other metallic parts and burning the box. The shock loosened a considerable extent of plaster. City Electrician Smith said that the shock which demolished the telephone in the jeweler's store must, he thought, have been very powerful, and had any one been at the telephone, he might have been killed; or, if the flame had passed near light goods, there might have been a conflagration.

Referring to the account in this column last issue of a telephone in a church at Carrollton, Ill., the manager of the Holliston, Mass., exchange says that he put a telephone in the Congregational church in that place April 1st, and, in addition to over fifteen subscribers in Holliston, parties sixteen miles distant have listened with pleasure to the music and sermons. The transmitter was at first placed at the right of the pulpit, but afterward changed to directly in front, with better result. The top of the transmitter is just above the bible on the pulpit, so that the speaker's voice strikes it at exactly the right point. It is also arranged so that it can at will be changed to the vestry below.

The Bell Telephone Company of Missouri, whose executive offices are situated at 417 Olive street, St. Louis, has the following officers: H. H. Eldred, President; Geo. F. Durant, Vice-President and General Manager; E. A. Smith, Secretary. The offices are all numbered; 100 office, W. E. Rodgers, Manager, has 9 operators and 415 subscribers; 600 office, John Casey, Manager, 2 operators and 141 subscribers; 900 office, J. Bauer, Manager, 3 operators, 137 subscribers; 1,500 office, W. J. Byrne, Manager, 4 operators, 219 subscribers. The Law system is used with some modification, which, it is claimed, secures greater speed in connecting subscribers. The representative of THE OPERATOR, while in St. Louis recently, tried the system on trunk line connections, making from one instrument five connections in 2 minutes and 45 seconds.

## DASHES HERE AND THERE.

Boston has refused to allow the Fire Department to carry its wires on poles across the Public Garden, and this is believed to be the beginning of official intervention to protect the city against the wire nuisance.

Messrs. L. G. Tillotson & Co., in a full-page advertisement in the present issue, draw attention to the new edition of "Smith's Manual," just published, a copy of which they will send to any address for 30c.

A bill was introduced in the Assembly at Albany, N. Y., May 12, by Mr. Spinola, to tax tele-

graph poles and wires. It requires the companies to make verified returns of the length of wires to the county treasurers and State Comptroller for purposes of taxation.

Messrs. Jerome, Redding & Co. make a change in their advertisement this issue, announcing that in future their well-known and popular "Gem" learners' instruments will be made with brass sounder and key levers, nicely finished and with perfect adjustment for both. The price of the "Gem" will not, however, be advanced.

In Chicago, the Common Council having ordered all telegraph wires to be placed under ground after the 1st of May, the telegraph and telephone companies are at work, night and day, stringing all the wires that can by any possibility be got upon the poles, so that they will not need to stretch any more for the next 200 years.

Messrs. J. H. Bunnell & Co.'s page advertisement in this issue will be found of interest to purchasers of electrical instruments and supplies. Messrs. Bunnell & Co. will soon issue, for free distribution, a new and complete catalogue of the various goods they manufacture and sell.

Western Union business for the month of April has been the heaviest the company has had since it has been in existence. At the present rate of business the company is earning more than 8 per cent. net on the new capital. The reduction of expenses resulting from the consolidation has been something far beyond the expectation of the managers.

The Gas Commission, consisting of Mayor Grace, Comptroller Campbell and Commissioner of Public Works Thompson, has awarded to the Brush Electric Light Company the contract for lighting that portion of the city bounded by Broadway, Fourth avenue, Fourteenth and Thirty-fourth streets, from June 1, 1881, to May 1, 1882, at \$6,783.33. The company has obtained the necessary permit from the Park Department to light Union and Madison squares.

Mr. C. S. Shivler has resigned his position as metropolitan superintendent of the American Union, to accept the general superintendence of the Continental Company. The American Union employes, with whom Mr. Shivler was deservedly popular, made him an appropriate presentation. Mr. Wm. J. Dealy has resigned the management of the American Union main office to succeed Mr. Shivler, and Mr. W. B. Waycott has been appointed acting manager at 135 in Mr. Dealy's place.

The Brush Electric Light Company propose to light Chestnut street, Philadelphia, from the Schuylkill to the Delaware rivers—a distance of 2½ miles—for one year for \$5,000. Before the City Councils of that city it was stated that during the four months the Brush lights have been used in New York they have been out only three times when they should have been lighted, and that was when only one engine was in operation; but now, with three engines running, the lights could only cease for about ten minutes at the most. In Cleveland, where the light had been in operation for a year, it had gone out only once, caused by the cutting of a wire on which some acid had been thrown from a druggist's window.

The Inman steamer *City of Richmond*, eight days from Queenstown, arrived here last Monday with Mr. Bates, the electrician, and his staff, who came over to note the working of the Swan incandescent lights, with which the ship's cabin was illuminated during the voyage. The main saloon was lighted by six lamps, comprising thirty electric jets, and eleven others were distributed at various points on board, making seventeen in all. Some of the state rooms were similarly illuminated.

The light is described by those who observed it during the voyage as very steady and mellow, being wholly destitute of the objectionable violet tinge that seems inseparable from the voltaic arc when carbon electrodes are employed. It was steady, not subject to fluctuation or accident, easily managed, and very brilliant. The six lamps in the main saloon rendered the apartment as light as day, enabling passengers to read at any point. The experiment will be continued on the return voyage at the expense of the inventor, but after that the company will have to make terms if it is to be employed further. The lamp is regarded by English electricians as one of the simplest

and most efficient yet invented, and as successful in an economical point of view by subdividing the current within the glass globe that protects the incandescent bars.

### PERSONAL.

Mr. James P. Golden is with the American Union, at Columbus, O.

Mr. C. W. Potter, late Chief W. U., Repairer, Columbus, O., is at Mitchell, Ind.

Mr. and Mrs. L. G. Tillotson sail for Europe next week, to be gone several months.

Miss M. A. Perkins has been appointed Manager W. U. at Mt. Vernon, O., vice E. C. Janes, resigned.

Mr. B. F. Stone, Manager A. U. office, corner Fifth avenue and Monroe street, Chicago, was married April 27 to Ada R. Day.

Mr. S. N. Cooper, formerly operator in the main office of the C. & N. W. Ry., Chicago, has been transferred to the train dispatcher's office.

We regret to chronicle the death of the eldest son, aged six years, of Superintendent Hugh Neilson, of Toronto, which took place April 29, of diphtheria.

Mr. John W. Duxbury, for many years with the Western Union Telegraph Co., in Boston, has just received the appointment of Superintendent of the Providence, R. I., Telephone Company.

Mr. W. H. Northway, formerly of the Chicago A. & P. office, has gone to Milwaukee, where he takes a position as operator in the main office of the Chicago, Milwaukee & St. Paul Railway.

Messrs. J. O. Dodge and H. K. Morley, of Bloomington, Ill., have invented a new repeater which has been in operation on the C. & A. wires for over a month, and is pronounced superior to the standard W. U. repeater. A patent has been applied for.

Thos. L. Clinton, Manager W. U. office, Rock Island, Ill., has absconded with \$500 of the company's money. He had only held the position of manager for two months, and was formerly night operator for the C., R. I. & P. R. R., in the same city.

A circular issued by the Chicago, St. Paul, Minneapolis & Omaha line states that Mr. H. C. Hope has been appointed Superintendent of the telegraph lines of the N. W. Telegraph Company on the entire road, with headquarters at St. Paul. He will have entire charge of the telegraph service for the telegraph and railroad companies in the territory mentioned, including maintenance, construction, and the general supervision of the operators of the line.

Professor William E. Sawyer, who was convicted in the Court of General Sessions of an assault, with intent to do bodily harm, committed upon Dr. Steele, was before Judge Donohue, in Supreme Court Chambers, on the 6th inst., on a writ of habeas corpus, for the purpose of having him admitted to bail pending an appeal. The exceptions having been filed, and the certificate of Judge Gildersleeve having been obtained, Judge Donohue fixed the bail at \$2,500, which was given.

Master Arcine Alton, aged 12 years, is a telegraph messenger in New Orleans. He recently found on the street a package containing negotiable bonds to the amount of \$14,000, and turned them over to a lawyer, receiving for his honesty 50 cents. A detective then stepped in and was paid seven hundred dollars for having the bonds returned to the real owner, while the honest telegraph boy has to be content with his reward of half a dollar.

Mr. C. J. Sheehan, the newly-appointed manager of the Providence, R. I., W. U. office, has been sixteen years in the telegraph business, and has filled every position from messenger boy to manager. He was formerly a newspaper compositor, then went into the employ of the old People's Telegraph line, from there to the Franklin, then to the management of the Atlantic & Pacific; was next appointed manager of the American Union, and now of the Western Union.

**WABASH APPOINTMENTS.**—The *Railroader* gives the following list of Wabash appointments: To the position of agent and operator: Messrs. H. S. Shapley, at Springfield shops; W. N. Ferguson, at Okalona, Ill.; C. Ross, ditto; L. A. Cloyd, at Roan, Ind.; T. A. Wesley, at

Emerald, Ohio, and D. B. Kirtland, at Mansfield, Ill. To be night operators: Messrs. Eugene Watrous, at Fairmont, Ill.; William Talkwell, at Ivesdale, and John Martin, at Decatur, Ill.

Our representative, Mr. Calder, desires to thank the following gentlemen for courtesies extended during his recent visit to St. Louis: Supt. L. C. Baker, Manager Brown, Chiefs Cummings and Topliff, and Messrs. T. P. Wheeler and W. H. Stanton of the W. U. Telegraph Company; Messrs. G. F. Durant, L. M. Fishback and W. W. Murray of the Bell Telephone Company, and M. K. McKenzie, Supt. Telegraph St. Louis & I. M. R. R.; also the following on the C. & A. Ry.: Messrs. W. K. Morley, Supt. Telegraph; C. M. Payn, Chief Dispatcher; J. M. Flynn, C. B. Cumpston, L. H. Thomas, Mat. Steele, Train-dispatchers, and H. K. Morley, J. A. Carter and M. F. White, operators.

**MONROE, MICH.**—Mr. Wilson has been promoted from night to day operator at C. S. Junction, vice A. B. Clark, who has been appointed train dispatcher at Slocum Junction, vice Wm. Tomkins, resigned. Mr. Tomkins has accepted a similar position with the C., M. & St. P. R. R. in Chicago. In him the T., C. S. & D. Railway loses one of its best operators, and probably as fine a train dispatcher as ever touched key. The boys were all sorry to see him go, but wish him success. Wes Lowry is back at his old stand as night operator in the Union Depot at Alexis. Miss May Quant is working nights at Monroe. Operator Fanning, of the repeating office at Grosse Isle, is on the sick list. Operator Stone, from the transfer-house, fills his place.—*Rail-roader*.

Mr. H. C. Bradford, who has been Manager of the Western Union and its predecessors in Providence, R. I., for 27 years; Mr. A. C. White, who has been chief operator for a long time, and Mr. A. L. Suesman who has been in the same office more than 17 years, have resigned. Mr. Bradford's future intentions are unknown. Mr. White has been appointed electrician-in-chief of the Providence Telephone Exchange. Mr. Suesman has for many years conducted an extensive business in newspaper advertising, and possibly may devote his whole time to it in the future. Mr. Bradford has been succeeded by Mr. C. J. Sheehan, late manager of the American Union, and Mr. White by Mr. J. P. Hurlburt, an old and valued employé of the Western Union. Both gentlemen are capably fitted for the places to which they have been appointed.

**GRAND RAPIDS, MICH.**—The many friends of Mr. John J. Deem, for a number of years train dispatcher of the Northern Division G. P. & I. R. R. Co., will be surprised to learn that he has resigned his position, and at present is touring. We hope to see him back at "D. S." again soon. His successor is Mr. Will Fitz Gerald, formerly Manager G. R. & I. and A. & P. offices. Mr. F. is a practical, clear-headed telegrapher, and will make an efficient officer at his new post. Mr. Mehan, chief operator, assumes the managership in the city office, and is assisted by Mr. Hann and Mr. Ed. Liddy, from Cedar Springs. Mr. W. M. Carpenter, Jr., and Miss Ada Cobb were quietly married April 19. Mr. C. is now in the Treasury Department, G. R. & I., but has made his dots and dashes in the past. Nothing new with the Western Union Company; business is good; no changes. Parties here have been experimenting with the Brush electric light, and it is probable that our principal streets will be lighted by that means in the course of ten or fifteen days.

### MARRIED.

**THOMPSON—SEWARD.**—April 27, at the residence of the bride's sister, Florida, N. Y., by the Rev. Dr. Seward, Mr. Chas. S. Thompson, Superintendent A. D. T. Co., Brooklyn, N. Y., to Miss Carrie J. Seward.

**DOWNES—WENTWORTH.**—At Haverhill, Mass., May 8, Mr. Frank Downes, Manager Mutual Union Telegraph Company, Oneco, Conn., to Miss Susie Wentworth, of Haverhill.

### DIED.

BEST ELECTRICAL ANNUNCIATORS.  
LONG BRANCH PATTERN.

PATENTED SEPT. 21, 1881.

**J. H. BUNNELL & CO.,**  
SOLE MANUFACTURERS AND AGENTS,  
No. 112 Liberty Street, - - - - - New York.  
An improved substitute for the "wringers" generally in use for this purpose.  
**MAKES A BEAUTIFULLY CLEAN AND PERFECT COPY IN AN INSTANT.**

Does not require a table or special supports and fastenings. Can be screwed to the wall in any convenient place, and occupies but about one-fourth the space necessary for the crank machine. It is ornamental in appearance, and is much better suited to the other surroundings in a well-equipped telegraph office than the laundry apparatus which has been generally used for message copying.  
**PRICE, \$7.50.**

**For Hotel, House, and Burglar Alarm Systems.**  
IN HANDSOME CASES WITH NICKEL-PLATED DROPS.

DANIEL ROMMEL, Sole Importer,  
58 Maiden Lane, New York.

# THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.

2d. The cells are all exactly alike.

3d. They continue exactly alike.

4th. They never get out of order.

5th. The first cost is less than any other.

6th. The connections NEVER corrode.

7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.

8th. The water cannot evaporate.

9th. The sal ammoniac cannot escape.

10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL.

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**  
140 FULTON STREET, NEW YORK.

WILLIAM A. CHILDS, Manager.

FRANK SHAW, Engineer.

A. G. DAY,

MANUFACTURER OF

Kerite Insulated Telegraph  
Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

Eminent Electricians and Practical  
Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

## Kerite Insulated Wire and Cables

A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

For sale by all dealers in Telegraphic Materials.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer.  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

The company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

E. T. GILLILAND, Electrician & Manager.

# Gilliland Electric Manufacturing Co.,

MANUFACTURERS OF

## TELEPHONIC APPARATUS AND SUPPLIES.

### SPECIALTIES:

### The Standard Switch-Board and Standard Magneto Call Bell.

The Gilliland Electric Manufacturing Company is the **LARGEST ESTABLISHMENT IN THE WORLD** making an exclusive specialty of telephonic apparatus. The aim and policy of its officers is to secure the most skillful and intelligent workmen possible, so that the inventive power and creative genius may have a relationship and harmony which will produce the revolutionizing labor-saving effects and perfect construction.

We can confidently announce that our machinery and tools have no equal or approximation by any other establishment—being comparatively new and of the latest improved pattern (not a single piece of second-hand or old machinery in the works), to which we are adding from day to day, that our friends may reap all the advantages that skill, science and ingenuity may give us and them.

### OF OUR STANDARD SWITCH-BOARD NEARLY 800 HAVE BEEN SOLD.

The Standard has been adopted by nearly all of the principal Exchanges of this country and the International Company for Europe.

We also manufacture Special Switch-Boards, among which are the Fay, Haskin, Vail, Durant and Sabin systems.

Of the many large cities using our Switch-Boards, we mention the following: Boston, Philadelphia, Denver, Buffalo, Toledo, Dayton, Louisville, Vicksburg, Chicago, St. Louis, Kansas City, Hot Springs, Memphis, Omaha, Salt Lake, Montreal, New Orleans, Milwaukee, and numerous large cities of Europe, with the greater majority of the smaller cities, towns and villages of this country.

### Of the Gilliland Standard Magneto Bell 20,000 are Now in Use, Everywhere Giving Satisfaction.

Our Standard Magneto Bell, which we originally introduced, was immensely popular with the Desk and Battery Box Improvement, and when we added the "Automatic" feature, other parties adopted our styles, in order to secure a part of the avalanche of orders with which we were and are at present overwhelmed.

We also added other improvements, that are being taken up in some form, by every manufacturer in the country, viz:

- The small and compact bell box.
- The base-board with connections run for transmitters.
- The base-board, desk and battery box.
- Our present form of generator.
- Our noiseless metal gear, designed to supersede the noisy cog-wheel and rubber-band nuisance.
- Exterior bell adjusters.
- Hinged door for easy access to apparatus.
- Our improved lock and key.
- Power generator, and many others of importance.

### We claim for our Standard Bell superiority in the following points:

- 1st. Strength of current generated. All of our bells are tested to ring through 5,000 ohms resistance.
- 2d. Durability is secured through the application of the best mechanical principles and workmanship, together with the use of materials best adapted to the purpose and of the finest quality. All contact points are platina tipped.
- 3d. Our system of *interchangeability in all parts* of the bell obviates any necessity for expensive repairs in case of accident, as we can furnish any part at a moment's notice, and guarantee it to fit perfectly without alteration. Each piece is made to standard gauge, and we furnish customers with a numbered diagram showing every part of both bell and switch-board.

Having largely increased our facilities, we are now enabled to assure promptness in filling orders. All goods of our manufacture are guaranteed to give entire satisfaction. We shall be pleased to furnish exchanges a sample Magneto-Bell subject to approval, and illustrated and descriptive circular of switch-board, magneto bells, etc.

We are prepared to furnish Telegraph and Electrical Supplies in any quantity at the lowest rates. Shall be pleased to make quotations or furnish any information desired, on application.

Correspondence Solicited. Address,

**GILLILAND ELECTRIC MANUFACTURING COMPANY,**  
INDIANAPOLIS, IND.

## TELEGRAPHIC SPECIALTIES.

THE GIANT SOUNDER PERFECTED.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5 00.

## THE DELANY PATENT REVOLVING DISC,

OR UNIVERSAL PLATINA CONTACT KEY.

This key embraces the only positive remedy for sticking; obviates direct anvil pounding, and thereby prevents operators' paralysis. Legless, hard rubber base, nickel-plated, and the handsomest, most durable, and only perfect key manufactured. Price, \$5; by mail, \$5.35.

## CHAMPION LIGHTNING ARRESTER.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

## THE CHLORINE BATTERY.

D. H. Fitch Patent, Sept. 16, 1879. For telephones, burglar alarms, call bells, etc. Price per cell, \$1.75.

## PREMIUM LEARNERS' APPARATUS.

**ONLY \$5.00.**

**Not the Cheapest, but Guaranteed the Best!**

The PREMIUM LEARNERS' APPARATUS AND OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

Price, Complete Outfit.....	Money in advance, \$5 00
" Instrument without Battery.....	4 20
" wound with finer wires for lines of one to fifteen miles..	5 00
" Cell of Battery, Complete.....	80
" Instrument without Battery, by Mail.....	4 75
" Premium Sounder, Separate Base.....	2 50
" Key.....	1 75

All orders will receive our prompt and careful attention, and, to prevent delay in shipment, full shipping instructions with town, county, and State, should be given. Remittances should be made by P. O. money order, registered letter, draft or express, which will insure safe delivery. No goods sent C. O. D.

SEND FOR CIRCULARS.

Owing to the recent failure of a large Manufacturing Firm, we have been enabled to purchase several thousand miniature lanterns (as shown in cut) at a very low price. They are entirely new in design, and the most popular charm of the day. Can be worn as Ladies' Bangle Charms, or Gents' Watch Charms. The frame of charm is made from ROLLED GOLD, the globe of CRYSTAL GLASS, in either White, Red or Blue. Heretofore the regular wholesale price has been \$24.00 per dozen, but we are now enabled to mail Free, ONE ONLY, to any person, on receipt of ONE DOLLAR and this advertisement, thus giving to the readers of this paper the benefits of our purchase. To each person ordering we will mail our Catalogue and expect to gain new customers for other goods. As we can only furnish a limited number, we insert this advertisement one time only in this paper, hence require you to cut it out and send to us with your order on or before August 31st, 1881. If you send three green stamps with your order we will send by Registered Mail. Don't fail to send for this beauty before it is too late, and if you are not perfectly satisfied we will refund you the money. As to our responsibility we refer to any Bank or Express Co. in this city. Address

DAVID H. BATES,

*Assistant General Manager Western Union Telegraph Company.*

## David Homer Bates.

We present to our readers to-day one of the most successful, and at the same time one of the youngest and most popular, among the executive officers of the consolidated companies.

David H. Bates was born at Steubenville, Ohio, in the year 1843, and entered the service of the Pennsylvania Railroad in 1859—his first office being at the outer depot, Pittsburgh, which was destroyed by the rioters in July, 1877. Although he was then only sixteen years of age, it soon became evident to those about him that he had commenced life on the sound principle that it is better to wear out than to rust out. The clear insight and intense earnestness of purpose which have since led him onward to success, soon attracted attention, and in 1860, after a year's service at Pittsburgh, young Bates was transferred to the General Superintendent's office at Altoona, Penna.

In the following year (April, 1861), when the national flag was fired upon at Fort Sumter, new and wider fields were opened to him. The reverberations from that first cannon shot were felt throughout the North, from the Atlantic to the Pacific. Its rumblings were heard far up among the mountains of Pennsylvania, and patriotism there, as elsewhere, was quickened into stirring activity.

As the gallant troops from the Keystone State were marshaled for the impending war, it was found that transportation by railroad had become a question of the utmost importance. The Secretary of War, Hon. Simon Cameron, at once selected Thomas A. Scott, then Vice-President and subsequently President of the Pennsylvania Railroad Company, to act as General Manager of the United States Military Railroads and Telegraphs. Not being satisfied with the operators employed in Washington and vicinity, and naturally desiring to have about him only such men as he knew and could implicitly trust, Mr. Scott, on the 25th of April, 1861, sent for a staff of operators from his own lines, and accordingly the following named persons were directed to report at Washington: David Strouse (who died at Mexico, Pa., October, 1861), Richard O'Brien, D. H. Bates and Samuel M. Brown.

Being ordered to report at Washington, and reporting there were, however, two very different things in those lively times, but the youthful spirit of Mr. Bates—then only eighteen years of age—and the zeal of his fellow operators knew no such word as fail; as, indeed, subsequent events have fully demonstrated. At Perryville, Md., they found that the Confederates had destroyed the bridges at the Bush and Gunpowder rivers. The intrepid young telegraphers secured passage on the steamer *Maryland*, and arrived next day at Annapolis, where they reported to Gen. B. F. Butler, commanding. Brown was retained for duty at Annapolis, and the remainder of the party proceeded next day for Washington, arriving there about the 27th of April. Fresh impediments arose, the Confederates had destroyed the B. & O. Railroad bridge at Relay House, Md., and some culverts and small bridges between Annapolis and Washington, but the undaunted young men worked on, and finally reached the Capital. They were at once assigned to duty as follows: O'Brien to the B. & O. R. R. depot; Bates to the Navy Yard; and Strouse to act as Superintendent of the U. S. Military Telegraph. Soon after his arrival here young Bates was tendered a position

as first lieutenant in the regular army, which, with characteristic modesty, he declined.

The small body of earnest and efficient workers named above formed the nucleus of the "United States Military Telegraph," which afterward grew to such large proportions, and exercised so great an influence upon the conduct of the war and the destinies of the country. Indeed, it is not too much to say, that without this important adjunct of the service the war could not have been brought to so brilliant a termination. The efficiency of their service was amply testified to by Lieutenant General Winfield Scott and his successors in command. A better natured, more intelligent or harder-working set of men than the members of the Telegraphic Corps never laid hands upon a key. Sometimes quartered in a barn; again with only the sky above them, with the stump of a tree for an instrument table, they were found far out on the picket lines, heralding the first approach of the enemy, and always keeping the commanding general in instantaneous communication with his most advanced forces; sometimes called upon to do twenty-four hours' duty in a day, and always working without a murmur.

When Gen. Sherman received his orders to march "from Atlanta to the Sea," they were sent by telegraph, and the wires were immediately cut so that no further communication could be had. The next heard of Sherman was his report from the seacoast, and in the meantime the secrets had been religiously kept by the authorities and their trusted operators. Again, when, after the cessation of hostilities, communication was restored with Richmond, all wires passed through the War Department, where copies were taken of all dispatches for the South; the censorship of the press was still in force; everything depended upon the secrecy of the plans of the Administration, and in this, too, these faithful telegraphers remained true to their trust.

But, to return to our narrative: As the necessities of the War Department increased, operators flocked to Washington, fresh men arriving there daily, and the "U. S. M. T." grew until it might almost have been called a small army of itself. These new-comers were invariably assigned to a week's duty in the War Department ("Di") as a crucial test of their ability, and in this way Mr. Bates became personally acquainted with nearly the entire military telegraphic corps—a circumstance which may, in one sense, account for his wide popularity.

Mr. Bates remained two weeks at the Navy Yard—weeks then were as years now, so quickly did important events follow each other—winning the personal esteem of Admiral Dahlgren, who was in command, and was then transferred to the War Department office. The first office there was in a room adjoining that of the Secretary of War; but, so rapid was the increase of telegraphic business, the quarters were removed three or four times within one month. The telegraph office finally brought up (at least, it remained for two months) at the head of the stairs—a place which has since become historical. It was in this little box-space that the news of the terrible defeat at Bull Run, in August, 1861, was received. Col. Scott, with his customary foresight, had previously arranged for mounted couriers, to and fro, between Fairfax, the furthest telegraph office, and the battle-ground, and it was here, in this inclosure at the head of the stairs in the War Department, that President Lincoln, Gen. Winfield Scott, Secretary Cameron, Secretary Seward, and other Cab-

inet officers, were seated, awaiting news from the front.

During the succeeding memorable events, Mr. Bates was not idle, for he seems to have mastered all the knotty problems, instead of allowing them to master him. One of the duties to which he was assigned was in connection with the "cipher department," every telegram of importance between the government and the army in the field being put in cipher, to prevent publicity. In this way projected movements of the greatest moment were generally known to the War Department cipher men on both sides far in advance of all others except the originators.

As an example of this kind of service, and the tact required on the part of the operators, we may mention the following case: In the fall of 1863, the *Tacony*, which had been captured by the Confederates, was cruising along the Atlantic coast, destroying smaller craft and creating consternation generally among the population of the seacoast cities. It was apprehended that, with the co-operation of Confederate agents in this city, an attempt would be made to seize some of our ocean steamers, and so capture freight and merchandise which was then so greatly needed in the South. Alexander Keith was believed to be the Confederate agent in Halifax, N. S., and through him it was understood that the Confederate Government communicated between Richmond and the northern portion of the United States, via Nassau, N. P. A cipher letter addressed to Keith was seized in December, 1863, and sent to Secretary Stanton, who put it in the hands of his trusted clerks, to be deciphered, but it was not until a week had elapsed that it fell into the hands of General (then Major) Eckert. This consummate electrician and tactician sent at once for Bates, Tinker and Chandler, who quickly translated the cipher. It proved to be of the utmost importance. Two days later a second letter to the same party was seized, and it, too, was easily read. From both these letters it was learned that Christmas Day (two days only after the last letter was seized) had been fixed for the shipment of Confederate bonds, notes, printing presses, etc., and the seizure of an outgoing ocean steamer after clearing from this port.

Acting upon the translation rendered by Mr. Bates and his fellow operators, Mr. Charles A. Dana, then Assistant Secretary of War and now editor of the *New York Sun*, started by the first train from Washington for this city to consult with Gen. Dix, and on the 24th of December he was able to telegraph to Secretary Stanton that all the principals engaged in the plot had been arrested, and that millions of dollars worth of Confederate bonds and notes, together with the presses, plates and paper in large quantities, had been seized. Had this plot not been frustrated—and it never would have been had not Mr. Bates and other telegraphers displayed their wonderful powers of discernment—and if the Confederate agents had succeeded in seizing the outgoing steamer, as planned, it is believed that the privateer *Tacony* would have been reinforced by other vessels, and that, perhaps, one or more Northern cities would have been burned; and, possibly, the tide of war turned in favor of the Confederates, whose prestige upon the seas at that time was increasing.

There is an interesting sequel to this story, not essential to the record, but valuable as a lesson in showing that the way of the transgressor is hard. Keith, the Confederate agent at Halifax, of whom we have just now spoken, disappeared

soon after the disclosures following the translation of his cipher letters and the frustration of his plans, and it was not until long after the war had ended that his whereabouts was discovered. It was then learned that he and Thomassen, the nitro-glycerine fiend, who shot himself on learning of the premature blowing up by one of his own infernal machines of the steamship *Mosel*, at Bremerhaven, were one and the same person.

It may be interesting to readers of *THE OPERATOR* to mention the nature of these captured "ciphers" which were frequently tossed over to Mr. Bates and his associates to translate. The following sentence is the date of a message from Gen. Joe. Johnston to Lieutenant General Pemberton, which was extracted from the coat collar of a scout taken at Walnut Hills, on the 30th June, 1863: "Lyemg-gl Ogug Lspe Vfg 47 Vf, 3681." The key to this cipher was found by taking, instead of the letter written, the third preceding or following it, in the order of the alphabet. Thus, L, the first letter in our example, meant "J" (the third letter preceding L); the Y meant "A" (the third succeeding Y); the E meant "C" (the third preceding E), and so on, the entire translation of the sentence being: "Jackson, Miss., June 30th, 1863."

Toward the close of the war Mr. Bates was offered the tempting position of Superintendent of Telegraph for the Pennsylvania Railroad, to succeed David McCargo, but declined it, preferring to remain in the service of the Government.

On the night of the assassination of President Lincoln, April 14, 1865, Mr. Bates was on duty at the War Department. Once again all the telegraph wires, with one exception, were cut, and once again the most reliable telegraphers were called upon to perform the most delicate and trustworthy duties. It was Mr. Bates himself who transmitted to New York, Philadelphia and Baltimore, the bulletins prepared by Hon. Edwin M. Stanton, at the bedside of the dying President, addressed to General Dix, at New York, and by him sent to the various newspapers throughout the country.

In this year, 1865, Mr. Bates was appointed Assistant Manager of the U. S. M. T., Department of the Potomac, and, in the following year, the cipher operators were formally thanked for their eminent services in a circular, of which the following is a copy:

OFFICE U. S. MILITARY TELEGRAPH, }  
WAR DEPARTMENT, }  
WASHINGTON, July 31, 1866. }

D. H. Bates, Assistant Manager, Department of the Potomac; Charles A. Tinker, Chief Operator, War Department; Albert B. Chandler, Cipher and Disbursing Clerk, War Department; A. H. Caldwell, Chief Operator, Army of the Potomac; Dennis Doren, Supt. of Construction, Department of the Potomac; Frank Stewart, Cipher Clerk, War Department; George W. Baldwin, Cipher Clerk, War Department; Richard O'Brien, Chief Operator, Department of North Carolina; George D. Sheldon, Chief Operator, Fortress Monroe; M. V. B. Buell, Chief Operator, Delaware & Eastern Shore Line, John H. Emerick, Chief Operator, Army of the James.

GENTLEMEN: I have been instructed by the Secretary of War to present to each of you one of the silver watches which were purchased and used to establish uniform time in the Army of the Potomac, marked "U. S. Military Telegraph," as an acknowledgment of the meritorious and valuable services you have rendered to the Government during the war, while under my direction, as an employé of the United States Military Telegraph.

It gives me great pleasure to comply with these instructions, and I will take this occasion to thank you, for myself, for your faithful performance of the important trusts which have been confided to you in the various capacities in

which you have served, and especially as "Cipher Operators."

Yours, very truly,  
THOS. T. ECKERT,  
Asst. Secretary of War  
and Supt. U. S. Military Telegraph.

After the consolidation of the old American, Western Union and United States Telegraph companies, in 1866, Mr. Bates was made manager of the general office in Washington, D. C.

In the following year (1867) he was appointed Superintendent of the Western Union Eighth, now the Sixth District, with headquarters at Philadelphia. As this is one of the most important districts in the country, extending from the vicinity of New York to Washington and from the Atlantic seaboard to the western border counties of Pennsylvania, the appointment of a young man, barely twenty-four years of age, to its superintendency was the best illustration of his tried fidelity and ability. The result fully justified the appointment. The youthful superintendent had here the first favorable opportunity to show fully the diversity and wide range of his natural executive ability.

The work of reorganizing the service was a task which even an older man might have shrunk from, but Mr. Bates went at it methodically and resolutely, and in a brief period everything was subject to his judicious and vigilant superintendence. His natural kindness of heart was no less noticeable than his firmness and determination, while his perfect courtesy rivalled his strict impartiality. A kinder eye never beamed on the faithful worker, but a heavier arm never fell upon the wrong-doer. Indeed his whole official life has exemplified the keenness and strength of that famed Toledo blade, which, while it could cleave an iron bar, would cut a silken scarf if drawn through its folds.

His eight years in Philadelphia left an enduring impression upon those who were associated with him, and which took palpable shape in the costly and beautiful testimonial tendered to him by the operators on the day he parted with them. High commendations from his superior officers and the press were so frequently bestowed that it would be unfair to specify, although we ought to mention Mr. Bates' masterly arrangement of wires, and splendid telegraphic service during the sessions of the Republican National Convention in Philadelphia, in 1872.

In 1875 Mr. Bates became General Superintendent of the Atlantic Division of the Atlantic & Pacific Telegraph Company, a position which he resigned, in 1879, to accept the Presidency of the late American Union Telegraph Company. This was Mr. Bates' crowning work, and we have always to regret, and perhaps occasionally to condemn, the strange circumstances which led to its abandonment. Never was a telegraphic enterprise commenced under more auspicious circumstances, or carried through in as brief a time to complete success. Commencing virtually in January, 1880, with a few but select workers, it ended abruptly, in less than one year thereafter, by monopolizing all that is original in thought, fresh in spirit, quick in action, and successful in everything. It worked with the regularity of a machine from the first, and every appointment justified itself and proved the keen discernment of Mr. Bates in the judicious selection of able lieutenants. There were chiefs alert, eloquent, courteous and glowing with energy; there were wide-awake local chiefs and operators, clerks and messengers—in fact, all that was enterprising and conquering in the telegraphic world—with Mr. Bates himself, ripe in judgment and

ability, above all, exercising his authority imperatively, but with such gentle pressure as to be scarcely felt.

Subsequent events must be fresh in the minds of our readers, so that Mr. Bates' record as First Vice-President of the American Union (after Gen. Eckert assumed the Presidency) and, later, his being called to his present position of Assistant to the General Manager of the Western Union, need not be recounted.

Like his great chief, Gen. Eckert, Mr. Bates appreciates good men when he sees them, and he has especially interested himself with good results in the career of many a promising youth. He is excellently qualified by experience and intellectual development for the high position which he now holds, and we feel safe in asserting that he will continue to exert the great power which rests in him for the advancement and protection of all deserving ones in the "wire age," which seems only to have just commenced.

#### The Inside History of the Consolidation.— Trial of the Williams Suit.

The trial of the suit of W. S. Williams against the Western Union Telegraph Company and others, having for its primary object the breaking down of the scheme of consolidation, was begun before Judge Truax, in the Superior Court, Equity Term, on the 16th ultimo, and was concluded on the 24th, the Judge reserving his decision.

The proceedings were remarkable for the great number of telegraph magnates and experts who testified—principally to their own forgetfulness of the most important transactions. Among the witnesses were Jay Gould—the first time he has "assisted" at a court of law since the trial of Edward S. Stokes for the murder of James Fisk Jr., in 1873—Dr. Norvin Green, General Eckert and D. H. Bates.

On the first day of the trial, the first witness called was Dr. Norvin Green, President of the Western Union Company. He testified that the Western Union did not feel the competition of the American Union until about July last. At that time the public patronage seemed to be divided between the two companies, and that, too, at the places considered most important by the Western Union. He had no idea, then, of a consolidation, and did not hear of such a proposition until the morning of the 10th of January last. In response to a note received by him, he then called upon Mr. William H. Vanderbilt. The first thing Mr. Vanderbilt said to him was: "I have seen the Great Mogul." In response to Mr. Sewell, Dr. Green said: "I knew, of course, that he referred to Jay Gould."

The conference between Messrs. Vanderbilt and Gould, Dr. Green said, took place on Sunday, Jan. 9, 1881. At it Mr. Gould intimated that he was willing to enter into negotiations for a consolidation of the telegraph companies in order to put an end to ruinous competition. A second conference took place at Mr. Vanderbilt's house on the night of Monday, Jan. 10, 1881. The persons present were William H. Vanderbilt, Augustus Schell, Dr. Green and H. McK. Twombly. It was then proposed to increase the Western Union capital stock to \$70,000,000, and to give the American Union \$10,000,000 of the increased stock for its property. The demand of the latter company was for \$15,000,000. Another conference was held between the parties above named on the Western Union side, and Messrs. Gould, Sidney Dillon and Russell Sage, representing the American Union. Mr. Gould was willing to take \$10,000,000, but his friends insisted upon \$15,000,000. Mr. Vanderbilt and Mr. Schell held a special conference with Messrs. Gould and Dillon, and these four persons prepared the agreement of consolidation which has been ratified. At the same time they determined that as quickly as vacancies should occur in the Board of Directors they should be filled by Messrs.

Gould, Sage and Dillon, and Gen. Eckert. Dr. Green next said, that in the course of the negotiations the representatives of the Western Union did not take fully into consideration the actual value of the American Union property. The things considered were the value of the property to the Western Union, and the benefit which that company would derive by getting the American Union out of its way. Dr. Green admitted that the American Union property was not worth more than half the consideration given for it by the Western Union, and he said that he believed that other Directors of the Western Union knew these facts as well as he did.

Under cross-examination by Mr. A. J. Vanderpoel, Dr. Green said that if the ruinous competition between the Western Union and American Union had been continued, the Western Union would have been compelled to stop paying dividends.

Upon further direct examination Dr. Green said that, among other things, the American Union Company, before consolidation, owned valuable contracts with the Pennsylvania and other railroad companies, whereby they operated their offices at comparatively little expense. The company was also in a position to make these contracts advantageously, inasmuch as Mr. Gould, its vice-president, was also an officer in a number of companies. The Western Union, Dr. Green said, was forced into expensive litigation with railroads controlled by Jay Gould, and, through the efforts of that operator, it was deprived of the control of 3,000 miles of lines along the Pacific railroads. In the six months last prior to the consolidation of the three telegraph companies, the receipts of the Western Union fell off \$804,000, the greater part of which reduction occurred in the last three months. Dr. Green admitted to Mr. Sewell, upon redirect examination, that the knowledge of the intended consolidation of the three corporations was valuable, and that on the strength of it he bought some stock. He also told some of the Western Union stockholders about the project, but refused to talk to other persons about it.

Mr. Augustus Schell, of the Western Union, testified, among other things, that the agreement of February 3 was made in the Twenty-third Street telegraph office, and that he, too, also went down town and bought some stock, and kept the matter very quiet.

General Eckert, General Manager of the Western Union, and formerly President of the American Union, said that when he was President the latter company had only 10,000 miles of wire, and that these ran in most instances parallel with the Western Union. He testified further that the American Union, at the time of consolidation, was just about paying expenses, and that in the previous year its receipts did not equal its expenditures.

Mr. D. H. Bates, Assistant General Manager of the Western Union, and formerly President and Vice-President of the American Union, testified that he was one of the original corporators of the American Union Company, having subscribed and paid for one-fourth of the whole amount of its stock.

Mr. Sewell asked how he paid for it.

Mr. Bates—With money in the shape of a check.

Mr. Sewell—Whose check?

After a controversy between the opposing counsel as to the propriety of the question, Mr. Bates was allowed to answer it, and replied: "Jay Gould's check." Mr. Bates said he was an expert in telegraph matters, and thought that a saving of \$2,000,000 a year would be effected by the union of the companies.

Mr. Giovanni P. Morisini, the so-called Treasurer of the American Union Company, proved himself the greatest know-nothing of all. He was examined by Mr. Sewell, who extracted the following valuable information from him:

Q.—What is your first name? A.—Giovanni.

Q.—George? A.—No; Giovanni.

Q.—You reside in the city of New York? A.—No, sir; Mount St. Vincent, New York.

Q.—You are Treasurer of the American Union Telegraph Company? A.—I am, sir.

Q.—How long have you been such Treasurer? A.—Since the organization of the company.

Q.—Have you got the books of the company? A.—No, sir.

Q.—Where are they? A.—I don't know where they are.

Q.—You don't know where they are? A.—No, sir.

Q.—Did you ever see them? A.—No, sir.

Q.—You never saw them? A.—No, sir.

Q.—Never made any entries in them? A.—No, sir.

Q.—Never kept any account of the money you received? A.—No, sir.

Q.—What were your duties as Treasurer of the company? A.—I was only nominally.

Q.—You were nominally Treasurer? A.—Yes, sir.

Q.—You never received any money? A.—No.

Q.—The capital stock of that company was never paid to you? A.—No, sir.

Q.—Did you ever sign any checks? A.—No, sir.

Q.—Did you ever do any duties as Treasurer of the American Union Telegraph Company? A.—No, sir.

Q.—Do you know anything about that organization? A.—No, sir.

Q.—Who made you Treasurer of the company? A.—I was appointed by the Board of Directors.

Q.—Did you get your appointment in writing? A.—It was by voice.

Q.—Who communicated the appointment to you? A.—I have forgotten—somebody.

Q.—Was there a salary connected with the place? A.—No, sir.

Q.—Who were the Board of Directors? A.—Well, I was not a director. I have forgotten who they were. I suppose Gen. Eckert and several others.

When the name of Jay Gould was called, that gentleman laid aside his white high hat and stepped up nimbly to the witness chair. He said that he was one of the original promoters of the American Union Company, and that the other two were Mr. Bates and Mr. Tinker; that the articles of association were not drawn by him or under his direction, and that he did not remember under whose direction they were drawn. He continued to forget as follows:

Q.—Mr. Bates testified that you drew the check for the money used to pay for the stock subscribed for in his name. Did you furnish a check to Mr. Bates for that purpose? A.—I do not remember.

Q.—Did you ever get it back? A.—I do not remember.

Q.—Did you furnish Mr. Tinker a check to pay for capital stock? A.—I do not remember.

Q.—Do you remember getting back any such check from Mr. Bates or anybody? A.—I do not remember the details.

Q.—How much did you subscribe yourself? A.—I think I subscribed for five millions.

Q.—Did you pay with your check for five millions? A.—I think I did. I think I paid in a check of five millions or ten millions. I am not certain. I do not remember the details.

With regard to the initiation of the consolidation scheme, the following was elicited from Mr. Gould:

Q.—Did you initiate proceedings for the consolidation of these several interests? A.—I did not.

Q.—Who did, if you know? A.—Mr. Vanderbilt wrote me this note:

"DEAR SIR: I would like to see you a few moments at 9 o'clock, if convenient to you, at my house. Yours, very truly,

"W. H. VANDERBILT."

Q.—I see it is not dated; but you have given us the date you received it? A.—I received it on Sunday, the day of the meeting of the committees.

Q.—That has been identified here as Sunday, the 9th of January. I suppose there will be no difference in your memory with respect to that? Mr. Sewell offered it in evidence.

Q.—You went to see Mr. Vanderbilt? A.—I did.

Q.—Was anybody present at that interview between you and him? A.—No, sir.

Q.—Will you be kind enough to state to the court as nearly as you can remember the actual language which you used on that occasion, and which Mr. Vanderbilt used? A.—Mr. Vanderbilt said that he had had some talk with Mr. Dillon, the President of the Union Pacific, and Mr. Dillon had told him that he thought I was not averse to making a fair arrangement between the companies. He said: I felt impelled to press it myself, because the stock was declining, and it was hurting a great many people; they were coming to his house and writing him letters,

urging him to have a settlement made, and he said that was the reason he had in seeing if some settlement could not be made. I told him that, so far as I was concerned—. He said, among other things, he had received a letter from Hatch. He said Hatch had written him that I did not control the American Union at all. I told him that was very true, I was only a minority holder; that parties that owned that had their own opinion of its value, and the best I could do would be to have committees—men that were largely interested in the two companies—meet together and talk the matter over. He asked me if I would have some of our people notified, and I told him I would. He said he would notify the Western Union. The next morning I received a note from him. I left, went away, and the next morning received a note from him notifying me of the meeting at his house on Tuesday evening, or Monday, January 10, 1881. I notified General Eckert, Mr. Ames, Mr. Dillon and Mr. Sage prominent members of the company. I think I notified some others, but it was decided uniformly that these gentlemen should be a committee representing our side. I had in view the fact of the official position of General Eckert as President, and the prominent position of the other gentlemen as directors of the company.

The remainder of his testimony, so far as the great financier could remember, was corroborative of the statement made by Dr. Green concerning the consolidation. Asked as to the condition of the American Union and its prospects at that time, Mr. Gould replied that the company had 70,000 miles of wire in operation, and between 800 and 900 offices. They were gradually opening out, and a large business was in prospect. He himself calculated to make 6 per cent. profit on the investment, but Gen. Eckert was of the opinion that 20 per cent. would be yielded. He estimated the monthly expenses to be \$80,000, and at that time the monthly receipts were as high as \$120,000. For this present year he calculated the receipts would be over \$2,000,000, while the expenses would still remain about \$80,000 a month. He had carefully watched the development of the American Union, and he was free to say that he considered their property cheap at \$15,000,000. He thought the American Union Telegraph system could not be reproduced, for the control of the railroads could not again be readily secured. Such a control as that obtained by the American Union would cost \$40,000,000 or \$50,000,000. His experience was that the railroads much preferred an association with the Western Union to association with a new company. Small companies would stand no show at all in competing with the Western Union for railroad favors. His ownership in railroads and his Directorship enabled him to secure exceptional advantages for the American Union Company. Such facilities were not for sale to-day.

Upon his cross-examination Mr. Gould said that at the time of the consolidation his share in American Union stock was about \$1,000,000, and that in Western Union about \$9,000,000. Mr. Vanderbilt distinctly told him that he had no stock of the American Union. Mr. Gould denied emphatically that portion of Mr. Williams' complaint charging that the consolidation was an unlawful combination to injure the interests of Western Union stockholders. He fully believed that the consolidation was the salvation of the Western Union. He thought the Western Union had much the best of the trade. As proof that the Western Union was very considerably benefited Mr. Gould pointed out the fact that its stock rose from 95 to 102. He asserted that public opinion recognized that Western Union had been strengthened, otherwise the stock would not have gone up. Mr. Gould added more information about the promising condition of the American Union at the time of consolidation. He had perfected arrangements to include in its system an additional 5,200 miles in the region to the southwest of St. Louis, where the Western Union was already strongly entrenched. Besides that, he had just let the contracts for a couple of cables. The Western Union earned from its cable service alone about \$500,000 yearly.

To Gen. Sewell Mr. Gould admitted, with a broad smile, that he had exchanged all of his American Union stock into Western Union stock; that he was one of the early birds. [Laughter.] He wanted to be on the safe side,

and, finding he was a little lame [laughter], he started early to make the exchange. He believed he was one of the first to make this exchange, for if his memory served him right, the machine for stamping the certificates was not ready quite as soon as he was. [Laughter.] The Central Construction Company also exchanged its stock for Western Union, and paid him his share of its bonds in Western Union. His share from this source was a million.

On the following day Mr. Gould was recalled, and, having meanwhile refreshed his memory, answered the following question:

Q. Have you found out since yesterday whether you gave a check for five or ten millions? A.—Ten millions.

Having thus come down to so fine a point as swearing to within fifty hundred thousand dollars of what he paid out, Mr. Gould remembered that he had talked with William H. Vanderbilt frequently, but never about buying or selling Western Union stock, and he never talked with him about a consolidation of the telegraph companies prior to Jan. 9, 1881.

The case for the defense having been opened by Mr. A. J. Vanderpoel, Dr. Norvin Green, President of the Western Union, was called as the first witness. Gen. Swayne handed him the last annual report of the Western Union Company, and asked him if the value of the property was correctly stated therein. Dr. Green answered that it was difficult to state the worth of such property as that of the Western Union, but that he felt certain that its value was understated in the report. The earning capacity of the Western Union, he said, was now certainly equal to at least that of an investment of \$80,000,000. He thought the company could easily earn 6 per cent. per annum upon a capital stock of \$80,000,000. Under cross-examination, Dr. Green said that as matters stood prior to the consolidation he did not think the value of the Western Union's property was \$41,000,000, exclusive of the \$15,000,000 of surplus earnings. He would not, prior to consolidation, have recommended the declaration of a stock dividend, as he did not think the company could have paid dividends upon increased capital stock. The value of the Western Union's property was depreciated by the opposition of the American Union, but it had appreciated since the consolidation. He felt certain that, although the Western Union's property may not have been worth \$41,000,000 prior to the consolidation, it thereafter became worth \$55,000,000.

The testimony of Mr. Jenkins Van Schaick, a witness called by the defendants, gave strong color to the claim already made that Mr. W. S. Williams was a "champertor," to use an old English law phrase, and that he bought the stock which qualified him to become a suitor for the express purpose of obtaining an injunction and thereby "bearing" the stock which he had bought.

That part of the examination of Mr. Van Schaick bearing directly on this point was as follows:

Q. Was Mr. Williams the sole owner of that property (the 100 shares of stock)?

Mr. Sewell—I object. He said he was the owner, and the gentleman is cross-examining his own witness.

The Court—How is it material?

Mr. Swayne—We labor under the belief that this 100 shares was transferred for the purpose of bringing this suit, and we are also under the impression that the ownership of this gentleman in this property was not an absolute ownership; that he is not the owner as he puts it in his testimony, in his own right; we deny that he was the owner in his own right; we deny that upon information and belief, and he avers it.

Q. When did he really become the owner?

Mr. Sewell—I object to it as immaterial, irrelevant and incompetent.

The Court—The question is allowed.

Q. Did Mr. Williams have the stock before the 22d of January? A. The title was in us, and we parted with the possession of the title to him.

Q. You bought stock for him that day? A. We bought for him stock that day. I remember distinctly buying 100 shares for him on that day, but I have no knowledge of that being the particular 100 shares which we gave to him.

This would seem to show that Mr. Williams (basing his rights as plaintiff on an even hundred shares of stock) bought that hundred shares

on Jan. 22, 1881, when newspaper statements, not contradicted on application to the parties concerned, had disseminated a belief that this stock was likely to be amalgamated with American Union stock, and while Mr. Rufus Hatch was bringing an injunction suit against the American Union Company before Judge Barrett. On Feb. 4 Judge Barrett dismissed the application of Mr. Hatch for an injunction, and on Feb. 11 Mr. Williams (having owned his stock just twenty days) brought an injunction suit on Western Union account.

Ex-Gov. E. D. Morgan, Russell Sage, John Van Horne, Charles S. Shvler, Sydney Dillon and John B. Van Every were also examined.

The argument was closed last Tuesday, and the case was submitted. Gen. Wager Swayne and Aaron J. Vanderpoel spoke for the defendants. Their line of argument was that at the time the plaintiff made his purchase of this stock notice had been given to every then stockholder of the Western Union Telegraph Company that the agreement of consolidation had been made, and that it had been proposed to increase the capital stock to \$80,000,000. The company owed no duty whatever to the plaintiff at that time. He bought his 100 shares of stock ten days thereafter, to wit., January 22, with his eyes open, and he has not ventured to go on the stand and to show that at the time he purchased this stock he did not know of that notice which had been sent to every then stockholder of the company, and he bought his stock from a person who did have that notice, and he takes it with all the notices as between himself and the company, and with notice of all the equities between himself and the company, and he does not complain in his complaint that he did not have notice of all these matters at the time of the purchase of his stock. He has, therefore, no standing in a Court of Equity.

Mr. Sewell summed up for the plaintiff. He argued that the plaintiff had an indefensible right to seek to prevent a proceeding that was clearly in violation of law. He was a stockholder of the Western Union, and he considered that it would be improper for that company to divide among its stockholders any of its increased capital stock unless those stockholders paid to it the value of the shares received by them. His position was a proper one, and he was sanctioned by the law. Mr. Sewell further argued that, as it was a condition of the contract for the consolidation of the three telegraph companies that the capital stock of the Western Union should be increased by \$38,000,000, and \$15,526,590 of shares should be distributed to Western Union stockholders, and that as these shares could not be distributed lawfully, the entire contract must fail for the failure of one of its essential parts.

Judge Truax then took all the papers, but reserved his decision pending the arrival of Mr. Vanderbilt from Europe. That gentleman arrived on the Germanic on Saturday.

At the close of the Williams suit, ex-Judge Whitehead, on the 25th. ultimo, opened the case of Rufus Hatch against the consolidation. This suit was brought for the same purpose as the Williams suit, viz., to restrain the Western Union from issuing \$15,526,590 of its increased capital to its present stockholders on account of dividends which those stockholders would have received if the surplus earnings of the company since 1866 had not been invested in real and personal property.

Ex-Judge Whitehead, in opening the case for the plaintiff, stated that the consolidation in Ohio and Pennsylvania was illegal, as the statutes of those States prohibit one competing company to purchase the lines of another. Also that the United States statutes hold the consolidation to be illegal, inasmuch as they forbid the purchase by a telegraph company using any military road or crossings or navigable rivers, of the lines of a competing company, though it may extend its own.

General Eckert was examined briefly, and an adjournment was ordered until Monday morning.

A St. Louis dealer in old clothes replenished his stock by delivering bogus telegrams to a number of wives that their husbands had been burned by nitric acid, which destroyed their clothing, and that fresh suits must be sent by the bearer.

### The Broom Begins to Sweep.

All persons of ordinary intelligence are supposed to have ideas. Telegraph employes, from the highest executive officer down to the manager, operator, clerk and messenger, all combined in one, of the smallest and most insignificant of the many thousand offices scattered over the country, are not only individuals of ordinary intelligence, but very many of them are of more than ordinary and not a few of extraordinary intelligence.

While each one of us thinks, or, properly speaking, while each one of us knows, from every-day experience, what is absolutely necessary for the proper performance of the business entrusted to us, we are often times compelled to squeeze through at a pinch, as it were, because the broom begins to sweep. Now that we are all one company, or at least working hard to be so, with good prospects of success; now that our capital has been doubled and we have the field almost entirely to ourselves, the first thing to be considered is to make provision for our regular quarterly division of the plums.

This is to be accomplished in two ways—by cutting down expenses, and by involuntary contributions from the public in the shape of tolls.

The second of these plans has not yet been entered upon to any considerable extent, but the first has been inaugurated, and as it is principally composed of two items—namely, salaries and supplies—and, further, as it is hardly thought good policy at this time to do anything about the firsts, except to let it alone (and for that let us be thankful), it readily becomes apparent that the seconds has the entire burden to carry, and, while many of us who are not in charge of large central offices are almost driven to distraction for material requisite for the proper running of our offices and to meet the requirements of the public, the broom is busily sweeping.

The interests and wishes of that capricious creature known as the public were consulted, when it was disposed to carry its favors elsewhere; blanks were sent to it without being asked for, and everything required could be easily secured by a simple nod. Pens, pencils and stationery sufficient, and a little margin besides, were always near at hand, in case of any sudden need of the same. But the broom has swept all that away, and the managers of the smaller class of offices, and even some of a higher grade, are hunting here and there trying to borrow from a neighbor what that neighbor does not possess, but which may be found in plenty locked up in the storehouses of the Grand Consolidation.

There seems to be a deep-rooted belief in the executive mind that about seven-eighths of the whole number of those who are in charge of the company's property all over the country, are either downright dishonest, wilfully destructive, or criminally negligent in their use of supplies. By an infallible system of calculation, allowing for all possible contingencies, so much material should be used in a certain time, and no more.

So many pens, for instance, it has been ascertained, are enough to do for your office, and you must do with them. Now, if they were all good; if the paper you have to use was not often about as fine as sack cloth; if every one used the same kind of pen in the same way; if every customer was particularly careful of them, which he is not (the only thing they seem to be particularly careful about is to remark in a loud whisper that they never saw a decent pen in a tele-

graph office yet); if the ink was not so largely composed of an acid which eats off the enamel almost immediately, and if all these causes and others combined did not tend to destroy a pen's usefulness almost before it had been pressed into service, the allotted number of pens might last the required time. As it is, however, if these reasons, and may be others that could be added, were taken into consideration, then perhaps the requisitions would not be cut down so much; and if a little more confidence were placed in the honesty and integrity of those who are fully deserving of it the interests of the company would not, we venture to think, suffer in consequence.

These thoughts, or similar ones, must have been forced upon the attention of many conscientious and scrupulously careful managers, who, owing to the fact that since business has increased so rapidly in the offices that are continued, they were found unprepared, through no fault or extravagant waste on their part, to meet this increased demand.

Brooms are exceedingly serviceable, and accomplish much good when properly used, but there is sometimes a desire to use them too constantly when new. It is a consolation, however, to reflect that they wear out in time, and then, fortunately, they don't sweep quite so often.

#### The Jones and Utica Fire Alarm Telephone Systems.

In our report of the exhibits made at the telephone convention, in the May 1 issue, mention of that of Messrs. C. E. Jones & Bro. was postponed until the cuts to accompany the article should be ready. We are now able to give cuts of both the Jones and the Utica Fire Alarm Company's systems.

The accompanying cuts explain, better than we were able to do in the May 1st issue without their aid, the Universal Section Switch, with Palmer's patent circular spring-jack, manufactured and exhibited by the Utica Fire Alarm Telegraph Company. As stated in that issue, objection has been made to the old style of spring-jack, that the spring became weak from use and wear, often leaving the line open at the contact points; also that small particles of dust, accidentally finding their way between the points, caused the same result.

In the Palmer spring-jack, which is mechanically a neat and handsome piece of work, these objections are removed, the spring and contact points being inclosed in a case into which dust cannot find entrance. The contact points make a rubbing contact, and therefore clean themselves, insuring perfect electrical contact, and the spring used being a spiral spring—instead of a straight or flat spring, as before—and of the best steel wire, and so arranged that its full power is always exerted, a perfect mechanical contact is also obtained.

A considerable advantage is gained in the arrangement of the parts, so as to prevent the great annoyance found in many other systems, caused by the plug dropping out by accident after connection has been made. The plug when in this jack remains, and is firmly held in place until removed by the operator.

The annunciator drop is of elegant appearance, combining lightness with strength, and has met with much favor in telephone exchanges throughout the country. The combination of these annunciators, spring-jacks and connection strips, in sections of 25, makes a complete and tasteful switch-board.

The principle upon which the Jones apparatus works is original with the manufacturers in most of its general features, as well as in its details of execution. The system is applicable to either magneto or battery signals. Every line has one terminal in a central or branch office. The lines are arranged in groups of fifty or

more, and are brought to a separate operating table, such as is shown in fig. 1. Each table is in charge of an operator, who sits before it.

Fig. 1 shows one table complete with forty drops, and a transfer arranged for four tables. The drops are fastened between the

UNIVERSAL SECTION SWITCH.

shelves by four screws, and any drop may be removed in an instant. New drops may be added at any time by simply screwing them on in position. The drop is very complete, contain-

SPRING JACK.

ing all the apparatus employed between the line and the ground wire. At the right is the cord holder, where cords hang when not in use. *F* is a plug socket, to use by inserting a plug connector, instead of holding over the crank, when the operator wishes to hold a prolonged conversation, or when he wishes to call or converse through the transfer. The spring lever *L*, in its normal position, is in connection with the telephone. When pressed down, it is in connection with the generator.

Fig. 2 shows a side view of one of the drops fixed between two shelves of the table, *D* being a target which falls when a call comes in from a subscriber. The target is reset when the crank

is turned for telephoning by the aid of the brass slide and the short arm on the right of the crank, as shown in cut. On the top of each shelf three strips are fixed, which are permanently connected up as follows: *G* to the ground, *E* to one side of generator, *T* to one side of telephone. The other sides of generator and telephone are connected to the ground. The incoming line is connected at the binding post *C*. The circuit passes thence through the coils to the metal work of the frame, thence by spring-jack *O* to ground wire. All the movable parts about the frame have rubbing contact, insuring complete circuit.

When a call comes in the crank is pressed to the right. A small eccentric on the same shaft with the crank lifts the spring-jack *O*, breaks the ground connection and makes a new connection through wing *S* to the generator strip, and sends signal currents to the line in answer to the call.

The same operation is performed in calling a subscriber. Some exchanges do not have their subscribers wait for an answer to their call, but instruct them to take down their telephone, and

SWITCH PLUG.

listen after giving the signal, as the operators are supposed to be always on duty. In that case, the operator, after receiving a signal, simply places the crank *N* to the left, thereby lifting spring-jack *O* again, and making connections with the other wing, at *S*, to the telephone, and at once communicates with subscriber.

When crank *N* is not pressed upon, it stands vertically, and the spring-jack *O* contacts with the ground strip. A spring holds it in this position. If the plug of a connecting cord be inserted in the socket *U*, the plug will lift the spring-jack from the ground strip, and the circuit will then be through the cord, whose other end may be plugged to another drop or to the transfer.

The drops are restored to their normal ground connection by simply pulling out the plugs. If the operator desires to listen, in order to test, when two drops are connected by a cord, he presses crank *N* of either drop to the left. This puts his telephone in connection with both parties.

Upon the top board of the table transfer sockets are arranged in groups of nine, and numbered from one to nine, each group being designated by a color or a letter, as red, white, blue, A, B, C, etc. These sockets are simply metal holes which receive the cord plugs, and each has a binding post behind the board. Each plug socket in each group is connected to the corresponding socket in the corresponding group on each table in the exchange; for instance, No. 1 red socket is connected by wire with No. 1 red socket on each of the different tables.

Each table in the exchange assumes the name of a color or a letter, corresponding to the order of the groups of sockets on the transfer-board. For instance, the first table is represented by the color red, the second table by white, etc., each table having exclusive use of its particular group of transfer sockets for making connections from its own to other tables.

In receiving transfers from other tables each operator plugs into the group representing the table from which the transfer is made. This peculiar transfer system is claimed to be absolutely perfect, being independent and non-interfering.

#### The Ground and its Relation to Telephonic Systems.

Filling, perhaps, the most important sphere in the realm of electrical communication, is the earth. We in America in this connection usually say the "ground;" yet there is no question but that the "earth" is both the most proper and the most comprehensive term to apply to this invaluable auxiliary.

No second place can be assigned to the earth, as a feature of our present telephone system. It is indeed the base, the groundwork, the very foundation upon which the entire superincum-

bent mass of telegraphy and telephony is erected. If we run a line two miles long, or twenty miles long, it is essential that a complete circuit shall be made before work can be done—before we can converse over it. What shall we do? Shall we construct a second wire from the end of our line back to the starting point, and join the two ends together through the instrument? Such a plan works well, but the way-aring man, or any other man, though a fool, can readily see that twice the line means twice the cost; and twice the cost counts. A cheap substitute offers itself; one that costs nothing and does its work on a moderately long line better even than a second wire, and one, moreover, that if properly applied at first needs no further attention. That substitute is the earth. Not every telephone exchange manager, we venture to say, credits the universal mother with the construction account thus saved.

When our lines are all completed and our switchboard is being set up, what is to become of the office end of perhaps a thousand lines, all of them safely connected to the earth at the

piece of magnet wire, and after locating his trouble between two stations, proceeds to connect the said magnet wire to the binding screw of the bell at the station next to the break toward the central office, so as to make at that station a temporary terminal. Cutting the station into circuit, what does he connect the other end of his magnet wire to? Again to the earth.

Two subscribers' lines are connected at the central office for conversation, and the supervising operator wants to know that they get connected all right, also to know when they finish, as in the telephone business time is money. What is to be done? Here, no doubt, the best way is to loop in listening and transmitting telephones, by means of a double cord, a wedge and a spring-jack, or other kindred devices. With the appliances found in many exchanges, especially the smaller ones, it is, however, often impracticable to do this. As an alternative, we can attach one bar in our switch to a wire, run that wire to our telephones and from them to the earth, thus forming a third leg to the two circuits already in communication, making an arrangement somewhat re-

once or twice, and leaves it. The telephone works, as what telephone will not; but it is in boot," despite the day of small things, and conclude that because *they* know all that is written here, and a great deal more beside, time and space are therefore thrown away. The object of this and similar articles is to furnish popular instruction for the thousands of the rank and file of our telephone men of to-day; the men who have to do the work, and who have had no chance for either twenty years' or even twenty months' apprenticeship at electrical work. Many exchange managers, also, and superintendents, have had no previous experience in the line they are now in, and will gladly hail even a small portion of the heaven which it is hoped will by and by leaven the whole lump.

The terminal ground will be first considered.

We have built our line. We are now connecting our bell and telephone, and the lineman, who has come from his last place with powerful recommendations, runs a light copper wire from the last binding screw of the bell to a lacquered bronze gas fixture, twists the wire, bared for three or four inches but not scraped, round the pipe

JONES TELEPHONE OPERATING TABLE.

SIDE VIEW OF DROP.

outer end? Again we connect the earth and, strange to say, we may if we please connect the whole of our thousand lines to one earth wire, without any apparent embarrassment, or interference one with the other, except under certain conditions.

We find by sad experience that if we provide no means of prevention, the lightning will run into our offices and houses by means of the wires intended solely for electricity of a gentler nature, and will burn up as a parched scroll our bells, our telephones and our annunciators. What is to be done?

We attach between our delicate instruments and the lines lightning arresters, and connect these arresters to the earth.

Some of us, still harassed by that effete bugbear, the notion that everybody is interested in, and wants to hear, what we say over our telephone lines, must of necessity, to preserve ourselves from that dreaded contingency, use what is popularly known as the "secrecy switch," which consists, as every one does not know, of an arrangement of wires and springs which opens the line on the side toward which you don't want to talk, connecting the broken fragment attached to your telephone to what? To the wire leading from the earth.

When a line breaks, an inspector issues forth to find the trouble. He arms himself with a

sembling the celebrated three-cornered duel of Mr. Midshipman Easy. This is found to work well when the circuits connected are both short.

One more genus of earth connection is worth noticing in this relation, and that is the "accidental"—the ground that comes on a circuit in the still hour of night, when churchyards yawn, etc. No trouble is more annoying than the "ground" or "escape," and its most remarkable property is the wonderful facility and perfection with which the earth connection is made in such cases. No inspector, office manager or trouble lineman can have failed to notice the ease with which such a ground forms itself, and perhaps to have contrasted with it the infinite trouble and difficulty he has experienced in making a good and reliable legitimate ground in its legitimate place. We see, therefore, that the earth, besides acting to assist us in our construction, occasionally throws in a little volunteer business on its own account, to remind us, as it were, of the services it ordinarily renders.

It will do none of us any harm, and perhaps some of us a little good, to cast an eye over the several uses of the ground wire, to see if we make the best use that we may of its benefits, and if possible to improve its facilities.

Let none of our telegraph and telephone experts, possessed of "every implement and means of art, and twenty years' apprenticeship to

spite of the "ground," not in virtue of it. The manager, who has, we suppose, seen fire, wonders why it takes so much battery to work that line. He has all he can do to attend to the complaints of the unfortunate subscribers; but at length finds time to take a trip over the line himself as he, out of the depth of his sad experience, suspects a bad connection. He passes along from station to station, coming in due course to the end, where after two minutes' scrutiny, he sees the cause of the "rottenness in Denmark." He remedies it in the following manner: Sending for his lineman, he will have a stout wire run to the nearest water pipe. The water pipe, which we will hope for its own sake is iron (lead should never be used), is then filed or scraped clean and bright for at least two inches laterally, and a No. 16 or 18 copper wire scraped bright, and having a length of at least six feet, is carefully and tightly wrapped around the scraped portion of the pipe, each convolution close to the preceding one until the whole of the brightened surface of the pipe is covered. The wire should be passed under several of the last convolutions, so as to pull tight, and enough left at the end, say eight inches, to make a good splice. This end is then spliced to the wire leading from the instrument; and for the first time in the life of our line it enjoys a good earth connection.

(TO BE CONCLUDED IN NEXT ISSUE.)

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, JUNE 1, 1881.

Americans visiting Europe will find THE OPERATOR on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

## NOTICE.

Non-subscribers into whose hands a copy of this issue may fall, will find on page 209 an advertisement offering to send the paper from the present time until January 1st, 1882, on receipt of FIFTY CENTS. Low rates at which the paper and one or more of our books will be mailed together, are also given.

No telegraph or telephone man should now neglect to subscribe to the representative paper of his profession. The expense, by this offer, is only three and a half cents a copy, *seven cents a month*, for a 20-page paper, literally overflowing with matter which is of indispensable value to every enterprising and progressive member of the profession.

Send in your subscription at once. THE OPERATOR was never as good as it is to-day, nor its subscription list so large. The more subscribers we have the better and more valuable we shall endeavor to make the paper.

Present subscribers will confer a great favor by drawing the attention of those who may not see a copy of this issue to the above remarkable offer, and if they can send us a few subscriptions, we shall be under additional obligations to them. A Bunnell steel lever key will be mailed, postage prepaid, as a premium for either twelve yearly subscriptions, at \$1 each, or twenty-five subscriptions until January 1, 1882, at fifty cents each. Any of the books we publish will be mailed as premiums to the amount of 25 per cent. of the sum remitted. *Non-subscribers can secure a copy of the paper for themselves free until January 1st, by sending us FOUR subscriptions at fifty cents each.*

## A SUCCESSFUL TELEGRAPHER

The name of David Homer Bates, whose picture we publish on our first page to-day, is indissolubly connected with the history of the telegraph in America, while Mr. Bates himself is still in the full grasp of his great abilities.

There seems to us to be something eminently proper in a journal especially representing the workers of a particular craft tracing out the successful career of one of its greatest chiefs—one who has had so great an influence on the destinies of so many of us, and on public affairs in general. Telegraphers have always been noted for their hearty enthusiasm for a worthy chief, and the worthy chief is no less noted for the implicit confidence which he reposes in reliable subordinates. We must feel, therefore, a deep interest in the personality of a man who for so many years has been looked up to as a just and impartial

administrator and, at the same time, as a genial friend. Nor are our reasons totally devoid of selfishness. Except for the mutual trust and affection which exist between employer and employé there could be no security of salary, position or promotion on the one hand, or of good workmanship on the other. This mutual esteem we should cherish, if we have even our own interests at heart, since no chains can be heavier than those forged by intolerance, oppression, mistrust and suspicion; and no organization, however rich or apparently strong otherwise, can be more quickly disorganized than by these agencies.

The oft-told story of Success is always profitable reading for the studious and ambitious, and we never tire of repeating it in all its varied and splendid forms. Those who are young or deficient in certain attributes necessary to success in life must, by reading and studying the examples of their illustrious predecessors, gradually, and, perhaps unconsciously, absorb many of the noble characteristics thus brought under their observation; and we could present no more fitting example than that which is produced to-day—an example of the comparatively unknown boy toiling in an obscure railroad telegraph office; gradually working his way upward: winning the esteem and confidence of those about him; the superintendent of an extensive and important district at twenty-four years of age; the President of the most complete and successful telegraph company ever organized before he is thirty-six; and stepping, in a period of less than twenty years, from the railroad operator's desk to one of the highest positions in the telegraph service.

With the present wonderful growth of the telegraph and the telephone, we may reasonably expect soon to have double or treble the present volume of telegraphic business. With this increase in traffic will necessarily come additional opportunities for the ambitious and deserving ones who are quick enough to perceive favorable chances and capable enough to anticipate or improve them.

In thus affording us such an excellent example of faithful work well rewarded, Mr. Bates has done more good for the *morale* and discipline of the service than he himself is, perhaps, willing to admit. Let us hope that the wholesome lesson will not be lost upon his fellow-workers; for he who can go and do likewise, who can command at will the patience, the industry, and the indomitable energy of David Homer Bates has within him the true source of all real and permanent success in life.

THAT was a characteristic remark made by Mr. Jay Gould during the Williams trial, in which he said, "with a broad smile," that during the negotiations for the abandonment of that grand and promising enterprise, the American Union Telegraph Company, he was one of the "early birds," or to improve upon Mr. Gould's classic remark, Mr. Gould simply "got his work in" while the remainder of the boys were napping. No one who has studied "the Great Mogul's" methods will doubt the truth of this candid declaration; and, while the abandonment of such a perfect opposition may have been very profitable to the aforesaid early birds, we who were innocent enough to accept their pledges of undying opposition fail to see where the occasion for the "broad smile" comes in. Under these protestations, expressed and implied, we supported and vouched for the genuineness and permanence of this "opposition;" we, along

with other gullible people, put implicit faith in personal assurances that theirs was truly a lasting and uncompromising opposition to the great telegraphic anaconda of the Western hemisphere, and when we hear of how the "early birds" slipped from under, we fail to see upon what pretext Mr. Jay Gould introduced his famous broad smile. The consolidation threw out of employment many men with large families, some of whom had been faithful servants for a quarter of a century, and for them there must be a world of pitiless malignity in that rich man's broad smile. But it is a tender topic, and is better left untouched if those who have been responsible for the pain, the canker and the grief can not approach it without betraying their mirthfulness in "broad smiles," and tossing off flippant remarks about the "early bird." He smiles best who smiles last.

In that popular work, "Lightning Flashes," there is a funny picture, drawn by Werner, entitled "A Scene on a Jersey Railroad," which has hitherto been accepted only in a Pickwickian sense; but it has recently been enacted in real life. Two phenomenal fools in North Carolina quarreled over the wire, and finally agreed to meet and fight a duel. Mr. de Fevre was angry, and the blood of the Cones was aroused in his antagonist, so that each man, muttering to himself, "Be he live or be he dead, I'll grind his bones to make my bread," boarded a train to meet the other. They proved, however, that there was at least one glimmer of sense left in their heads when they agreed to discard the deadly pistol and to substitute a war of fists. They went at it, hammer and tongs, their teeth achatter with the incessant shower of stinging blows, and finally wound up with an inglorious and unscientific knock-down-and-drag-out affair. Then they went back to their keys, sadder and, we hope, wiser telegraphers. The victor felt no better for his victory, while the vanquished "reck'd not of the prize he lost, but of his home, and that was far away," while the question of precedence on that circuit is still unsettled. They will probably keep on "salting" each other over the wire every time that either of them can scrape together a hundred words of press. It is some years since Jack Hurley, of Springfield, Mass., took the train for Worcester, with the intention of thumping speed into the operator at that place, and for which he was promptly retired to the local stone-jug. If these two telegraphic pugilists have not already been similarly "jugged," it is time they were taken in hand by their Superintendent.

REPRESENTATIVES of the American Cable Company arrived at Canso, N. S., on the 19th ult., to witness the landing of the shore end of the new (American) cable. There was much excitement among the citizens there. The steamer Faraday, which had been laying on and off the coast of Nova Scotia at Canso for several days, waiting for the dense fog which enveloped the whole coast to lift, put into Dover Bay about noon on the 21st ult. She reported an unusually quick run. The landing was successfully accomplished last Wednesday, the 23d, at seven o'clock in the evening, and then the Faraday commenced to "pay out" at the rate of 130 miles per day. The tests of the cable were kept up during the trip, and showed it to be in the most perfect condition. If no unforeseen accident prevent, the laying of the cable will soon be successfully completed, and it is now progressing at the rate

nearly one hundred and fifty miles every twenty-four hours. The projectors of the new cable are very hopeful as to its future. A commodious building for the accomodation of the staff of the station has been erected at Walsh's Point, near the shore, and a land line has been put up from that station to Canso.

The American Cable Construction Company was represented by its President, Mr. Doren, who expresses himself well pleased with the tests and appearance of the cable.

There are conflicting rumors as to whether or not "a working arrangement" has been effected between the new company and its European rivals.

THE firm attitude assumed by the English telegraphers in making their just claims is having its natural effect, and the indications are that the authorities will meet the operators more than half way. The petition of the latter demands, among other things, that the salary, on entering the service, commence at 16s. (\$4) per week, rising uninterruptedly by annual increments of 2s. (50c.) per week to £200 (\$1,000) per annum; that all the overtime (extra) be paid at the full rate of pay, reckoning six days per week, without deduction for any partial holiday; that all Sunday duty be paid for at the ordinary overtime rates; that seven hours be considered a night's work, any time worked beyond that to be paid for as overtime, duties after midnight to be considered as nightwork; that eight hours constitute a day's duty, to be performed without break, abolishing split or divided attendances; that three weeks' annual leave of absence, with pay, be granted to all "clerks" receiving 16s. to 40s. per week, and one calendar month to those receiving more than that amount. The case has been pending for some months, but in the House of Commons last Tuesday evening Rt. Hon. Henry Fawcett, Postmaster-General, replying to an inquiry, said that both the Treasury and Post-Office are now considering proposals which had been submitted to them in regard to the position of telegraph operators. He expressed his willingness to do what he could in their behalf. The result is watched for here with much interest.

ANY operator who is able to do satisfactory telegraphing, can get work now if he wants it, and strictly first-class men are eagerly sought after. This means telegraphic prosperity, consequent upon the extraordinary activity apparent in all branches of trade. The disposition to recognize our business as a profession, and to draw closer together as such, appears to be gaining ground, and we are pleased to see the discussion carried on openly and above board. Although salaries, particularly on some railroad lines, are wretchedly low, we have, in joining hands, less to expect financially than we have in the matter of purifying and elevating the profession. The indiscriminate manufacture and employment in the past few years of great numbers of cheap telegraphic quacks and plugs has materially lowered the standard. While we should do nothing to prevent any eligible young man from learning the business, we should discountenance the flimsy methods of "colleges," which literally grind out half-trained, ignorant and incapable tyros to be picked up at a bargain by shoddy superintendents, whose zeal to be considered economical far exceeds their supply of executive brains. In this way the profession is brought into disrepute. By giving attention to

this matter—and our executive officers will find it to their advantage to aid us in purifying our ranks—we can soon produce an educated and thoroughly trained class of operators.

WHATEVER may be said against the principles of the great telegraphic monopoly, there can be no two opinions with regard to its superb management, and its unprecedented facilities for handling the public business. There was a striking example of this when, on the night of Friday, the 20th ult., 109,486 words of "specials" were sent to Chicago. Without any previous warning to the company, the special correspondents in this city filed for Chicago that evening the greater part of the revised New Testament. This "dispatch" was equal to thirty-three columns of a newspaper and comprised 28 chapters of "St. Matthew," 16 of "St. Mark," 7 of "St. Luke," and 5 of "St. John." The officials at once made up twenty-one through circuits to Chicago, each a thousand miles in length, and in seven hours they were all clear. On the following afternoon, and again without warning, the "Epistle to the Romans" and the "Acts of the Apostles" were handed in for transmission to Chicago, and were immediately disposed of on seventeen wires. When it is understood that this sudden rush was handled without previous warning and without delay to the ordinary business, we must give unstinted praise to the management and discipline which makes such a feat possible. General Eckert, the local managers at Chicago and New York and the operators are alike worthy of the highest commendation.

BY the death of Mr. L. A. Gobright, of Washington, every telegrapher has lost a friend. During his forty-five years connection with the press in that city he became personally acquainted with every telegrapher who has resided there, and few operators who have worked at the Capital can forget how much they were indebted to Mr. Gobright for "extra." The appearance of his smiling countenance in a telegraph office, with a hundred sheets or so of press matter, and his pleasant injunction to "hoop 'em up, boys," was always the signal for commotion and fast telegraphing. Everybody knew and loved "Grandpa" Gobright, from the President of the United States down to the humblest telegraph messenger, and the news of his death has caused profound sorrow.

It will be ten years on the 10th inst. since that memorable Saturday, June 10, 1871, when the Morse statue was unveiled in Central Park. Few can have forgotten the joyful meeting of so many telegraphers from all sections of the country; the enjoyable excursion on the steamer James Fisk, Jr.; how our youthful bosoms swelled with pent-up pomposity as we marched aboard at the Pavonia Ferry and the band of the Fifty-ninth Regiment struck up "Solid Men to the Front;" how we appreciated the unceasing courtesy and hospitality of Mr. L. G. Tillotson, and how the presence among us of Father Morse himself made the occasion sacred in our memories.

THERE is a good deal of instructive and encouraging reading for the incipient opposition companies in the testimony given last week in the Superior Court, especially that part of it in which the various witnesses admit that the Western Union paid for the American Union more than twice its face value, the directors of the older company being quite willing to forget

the actual value of the lively opposition, while they looked only to the value of getting it out of the way. This little piece of inside information will tend to run up the price of the next opposition that is offered for sale.

IN the case of Anastasia Morrissey, who has just obtained a verdict against the Western Union for non-delivery of her message, the courts have once more affirmed the doctrine that when a telegraph company seeks public business it gives implied assurances that it employs the most skillful operators, reliable messengers and perfect instruments. As long as they do this, and pay good salaries for good men, they keep faith with the public; but when they get down to hiring old pelters at \$50 a month they are invariably mulcted, as they should be, for damages.

NOTWITHSTANDING the emphatic denial of General Superintendent C. H. Haskins, there can be no doubt of the truth of the report that the consolidated Western Union has leased the lines of the Northwestern Telegraph Company, thus adding 15,000 miles of wire to the great monopoly's system. Under the Wisconsin law the concern cannot be bought, but as Col. Clowry will probably include it in his Central Division of the Western Union by the 1st of next month, a perpetual lease may answer the same purpose as direct sale.

THERE is a swarm of lawyers already preying upon the monopoly, many of whom should, for economy's sake, be literally fired out. They are only a grade better than plumbers and hackmen, and if Gen. Eckert has any objection to paying out a million dollars or so in fees, he will apply the Sliding Scale to his force of legal mischiefs-makers.

THE OPERATOR invites questions on telegraphic and telephonic subjects of general interest, which will be answered, as far as possible, in the issue following their receipt. It is hoped that these questions and answers will prove of much value to our readers, who are invited to avail themselves freely of the privilege offered.

THERE is a field just opening in Mexico for wide-awake telegraph men. Money for telegraphic enterprises seems to be had simply for the asking, now-a-days, and the next year will see a wide extension of the telegraph south of the Rio Grande.

MR. AND MRS. CYRUS W. FIELD arrived home on the Britannic last week, after a tour around the world. They have been absent since the 2d of December last. Mr. Field has nothing new to say about the proposed Pacific cable.

IT appears from Dr. Green's testimony before Judge Truax that Mr. W. H. Vanderbilt was in the habit of referring to Mr. Jay Gould as "the Great Mogul"—probably because he found he had caught a Tartar.

OUR operators, by their remarkable feat of telegraphing the Bible to Chicago in quick time, have proved their title to pre-eminence. The effect on their morals has not yet been observed.

THE large amount of interesting matter for this issue necessitates a 24-page paper again.

WESTERN UNION stock is quoted at 129. Last issue it was 118 $\frac{3}{8}$ .

THE Jay now claims to be one of the early birds.

## Notes and Queries on Electricity and Electro-Magnetism and their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

Q. 127. Describe briefly the American District system of telegraphy.

A. This system has been for several years a great convenience in our cities; and its electrical department is simplicity itself.

The circuits, like those of the fire telegraph, are metallic, leaving one pole of the battery in the district office, running to a number of boxes placed at the residences and places of business of subscribers, and returning by another route to the other pole of the battery at the office. The boxes are merely small models of those used for fire service, and consist essentially of a metallic break-wheel and contact spring, both of which form part of the circuit. When the wheel rotates the circuit is closed and broken, and the signal correspondingly given. Different signals may be sent by the same box by different manipulation. For example, if a box signal was 29, 29 once transmitted would signify that a messenger was wanted; twice, would be a call for a policeman, and so on.

The signals are given by the back stroke of a relay closing a local circuit, embracing a local battery-register and a single stroke bell. The register records the signal on its strip of paper, and it is simultaneously struck on the bell.

Each subscriber is represented in the office by tickets bearing his number, so that no time is lost in ascertaining from whom the signal is sent. The batteries used in this system are generally of the gravity form, and are not usually very large, as the entire external resistance is not great, the relay being the only electro-magnet at all times in the circuit. If a line breaks, or disconnection from any cause takes place, the break is first localized, and until it can be repaired, a ground connection is attached at the nearest box on each side of the trouble, so as to complete the circuit through the earth. If an accidental connection with the ground should occur, or, as it is technically called, a "ground" appears on the wires, it should at once be tested for, by grounding the circuit at the office, and opening or sending signals from various boxes on the circuit.

Each box between the office ground and the fault will when operated send in its signal, while the boxes beyond the fault will not, they being short circuited or cut off by being between the fault and the office on the other side, so that neither the relay nor battery are in circuit with them. As soon as the ground is localized, it should be removed, as if another ground should appear, the effect would be the same as that just indicated—that is, all stations between the two grounds would be cut out.

Q. 128. What is usually the system of police telegraph?

A. There is no system especially devoted to police inter-communication, each city possessing such a system using that which in the eyes of its council appears to be the best.

In New York, a dial telegraph, worked by a step-by-step motion, is employed, wherein a pointer or index hand travels round a dial marked with the letters of the alphabet and the cardinal numerals. Each time the circuit is broken and closed the pointer advances one letter. This system is very popular, on account of the economy of maintenance and the ease with which it is worked.

Q. 129. Describe in a general manner the system of the stock printing telegraphs.

A. The stock printing telegraph is also essentially an American institution, and may now be said to be a necessity among the stock, cotton and produce brokers of our large cities. The entire business has grown up since 1866. Anything of the nature of a complete history of the business, or any details beyond a general description of its operation, would be out of place here.

The quotations of stocks, cotton and produce are collected from the various exchanges, and transmitted from the office or central operating

room, over a great number of wires to the offices of the subscribers. Information regarding interesting events and general news of the day is also gathered and furnished to special circuits arranged for that purpose.

In the place of business of each subscriber is a portable printing instrument which prints the communications in plain Roman type.

Many styles of printing instruments have been tried, but they may be all resolved into two classes. First, those operated by the automatic make and break of the circuit, and second, those operated by electrical pulsations of alternate positive and negative polarity.

An instrument of each character will here be briefly described.

The most generally used instrument of the first class, on account of its simplicity of operation, is what is technically known as the "three-wire stock" instrument.

It is, as its name indicates, operated by three distinct wires, one of which influences the alphabetical type wheel, another the numeral type wheel, and the third operating the press magnet and printing the quotations.

The transmitting device is alternately switched to the alphabet and figure wire; and whenever the type wheels are brought to the required letter or figure, the press wire is placed automatically in the battery circuit, and the impression given.

The wheels are operated by a step-by-step motion, each one on its own arbor, on which is also fixed a star-wheel, which is advanced by a lever attached to the magnet armatures.

The armature levers are both retracted by strong springs, and the star wheels are so placed that each time the armatures are attracted the type wheels are advanced one character, and each time they are withdrawn the wheels are advanced another character, so that work is done both by the charge and discharge of the magnets. The press magnet, by special mechanism, causes the strip of paper to advance a certain distance after each impression, so as to be ready for the next one. This instrument is much liked by the patrons, on account of the clear impressions and large type printed by it.

The instruments of the second class mentioned are, if possible, still more simple in construction, though a little more complex in principle, than the machine already described. They require but one line wire, and the type wheel prints both letters and figures, being made sufficiently large to contain both. The type wheel axis is driven by a clock train, operated by a weight or spring, and is controlled by an escapement attached to a polarized armature. This latter vibrates on pivots between the opposite poles of two electro-magnets, placed in the same circuit, facing each other, and both working the same polarized armature.

Instead of being vibrated by the alternate opening and closing of the circuit, it is drawn from side to side by rapidly succeeding pulsations of alternate polarity. That is to say, if one pulsation is sent from the positive pole of the battery, the next is sent from the negative pole, and so on; and each pulsation permits the type wheel to advance one character. A third magnet, with a much longer core than the two already mentioned, is also in circuit, and is provided with an armature, whose lever presses up the paper to the type wheel, to print the impression.

The rapidly alternating pulsations pass through this magnet, but its armature is not affected until a pause is made, because the alternately opposite pulsations succeed each other so rapidly that the long magnet has not time to become charged sufficiently to attract its armature, which is kept against its back stop by a stiff spring.

When, however, a current of either polarity is kept on the line longer than usual, the armature is instantly attracted, and the printing performed. The movement for feeding the paper is also performed by the armature lever of the printing magnet.

This instrument prints very rapidly. Both styles of instrument are placed in any required number on a circuit, and any number of circuits may, by relays or other contrivances, be operated by one key-board and operator.

CORRECTION.

To the Editor of The Operator:

SIR: Before the manuscript containing the

answer to 117 of my "Notes and Queries" left me an error crept in, which though small in itself, is yet large enough in its results to demand correction. It should read from the second paragraph as follows:

"The same rule relating to the proper proportionment of the electro-magnet to the circuit holds good in this case. For example, we have a line 200 miles long of No. 9 galvanized wire and a battery of eighty Calland cells. We are to have five relays. What should the resistance of each of those relays be?"

"We call the line wire resistance 16 ohms per mile; then for 200 miles the line resistance will be 3,200 ohms. Calling the battery resistance 3 ohms per cell, the resistance of the entire battery will be 240 ohms, giving as the total resistance of line and battery 3,440 ohms.

"Then, following the rule already given, we must make the total resistance of the electro-magnets 3,440 ohms also. This, divided by 5, for the number of magnets, gives, as the resistance of each magnet, 688 ohms. In practice, however, as has already been observed, it is well to keep the magnet resistance less than that of the line and battery, to allow for variations in resistance due to weather. Moreover, in this country, for uniformity, the resistance of the majority of relays used is made very much the same for comparatively long and short circuits.

"The condensed reason, then, why we use fine wire—and a great deal of it—for circuits of high resistance is, that the high resistance of the circuit greatly enfeebles the current, and we must use fine wire to make the best of the remaining strength of the current by a greatly increased number of convolutions." T. D. LOCKWOOD.

BOSTON, May 16, 1881.

## Cabinet Organs.

There are numerous firms throughout this country who advertise Cabinet or Parlor Organs, claiming superiority from facilities of manufacture, when in reality they never were manufacturers of any portion of an organ, and are simply agents and middlemen for firms who dare not, owing to the inferior quality of their instruments, advertise them over their own names. It is a well-known fact that the United States leads the world in the manufacture of Organs in quality of tone, excellence of mechanism and beauty of design; and no manufacturer stands higher in every respect than the Hon. Daniel F. Beatty, of Washington, New Jersey, whose manufactory is now the largest in the world that ships direct. This enterprising gentleman was the first to offer the music-loving populace an opportunity to purchase direct of the manufacturer, thereby saving the public the enormous profits of agents and middlemen. He has made many liberal offers, and has never failed to keep every promise and more; we have yet to receive the first complaint from any of our readers who have dealt with him. His last and grandest offer outstrips all others, and is an evidence of his unparalleled success. The Beethoven Organ is the most brilliant and powerful musical combination ever perfected, and its superiority over all other Organs is attained by the valuable Patent Stop Action held only by Mr. Beatty. The reader should bear in mind that the "Beethoven," which is shipped on one month's trial, has 27 Stops, 10 full sets of Golden Tongue Reeds, and is in every respect and detail the finest instrument in the world. The price at which the Beethoven is offered, \$60, which includes stool, book and music, must bring it within the reach of everyone. It is important that anyone desiring one of the Matchless Organs should order and remit at once by a Post Office Money Order, Bank Draft, Registered Letter or Express prepaid. Nothing is saved by correspondence, as the orders for this particular style are coming in so rapidly that the capacity of the Beatty Manufactory is being tested to its utmost, and cash orders very naturally take preference on order book. The feature of this great offer is to refund money sent and pay all freight charges if the instrument is not as represented. Is not this sufficient guaranty of the fair dealing of Mayor Beatty?

### Still Monopolizing.

As announced in our last issue, the Western Union has absorbed the Northwestern Telegraph Company. Superintendent Haskins, of the latter company, denies the truth of this statement, but the facts indicate that Mr. Haskins' wish is father to the denial. The lease has already been signed.

The Northwestern Telegraph Company was organized about twenty-five years ago by a few gentlemen who have retained control of it ever since. The territory occupied by them is north of Milwaukee and Janesville, in Wisconsin, their lines extending throughout that section of the State, the Michigan Peninsula, the whole of Minnesota, and into Dakota as far as the Missouri River, connecting with Manitoba. They have about 15,000 miles of wire, and in the neighborhood of 800 offices. The Western Union has been trying for years past to get hold of these lines, but would not agree to the Northwestern Company's terms. Within the last two months, however, fresh negotiations were opened, and an understanding reached. The details are a secret, and all that is known is that the Western Union has secured a perpetual lease of the wires and will take possession July 1. They cannot be bought on account of the Wisconsin law. The business relations of the two corporations have always been intimate, a contract existing between them, but there has been much complaint on the part of patrons by reason of delays in transmitting messages. Now that the Northwestern is to become a part of the Western Union system things will run smoothly. There will be no more transferring of business, but messages will be checked and sent direct to their destination. Mr. Simmons, of Kenosha, is President of the Northwestern, H. B. Hinsdale Secretary and Treasurer, and C. H. Haskins General Superintendent. All will probably retire, but as to the new managers nothing can be learned at present. When the Western Union takes charge the lines will become a part of the Central Division, which is run by Col. Clowry. When this happens the lines will be extended, the system strengthened, and better telegraph facilities be supplied. The headquarters of the district will perhaps be transferred from Milwaukee to St. Paul.

### The French Cable's Suit Against the Monopoly—Jay Gould Did not Control American Union and Does not Now Control Western Union.

Last Tuesday, May 24, the Western Union Telegraph Company filed its answer to the amended bill of the "Compagnie Française du Télégraphe de Paris à New York." The suit was brought shortly after the consolidation of the land telegraph companies was made public, to restrain the Western Union, under the late consolidation, from interfering with the contract of the French Cable Co. with the American Union, relative to the interchange of cable messages.

The answer is a general denial of the charges. It avers that the dividend among the stockholders of the Western Union represents the investment of the earnings of the company in the purchase, construction and equipment of additional lines since July 1, 1866, and that these were actually worth the amount mentioned in the agreement, \$15,526,590, exclusive of the stock of the Atlantic & Pacific Company.

It denies that at the time of the agreement of Jan. 19 Jay Gould and Frederick L. Ames owned and controlled a majority of the stock of the American Union Telegraph Company, or that Gould at the time of the filing of the bill owned or controlled, or now owns or controls, a majority of the stock of the Western Union Telegraph Company.

There is an admission in the answer that the American Union has transferred its property, rights and franchises, with the exceptions mentioned in the agreement, to the Western Union, and that the property of the former company has become so merged into and blended with that of the latter, that any attempt to sever and restore it would cause more injury to the defendants and to the public than the complainant can sustain. The effect of the purchase, it is averred, has been to enable the Western Union to reduce the rates charged by it for the trans-

mission of messages. The answer finally petitions the Court that the bill of complaint against the Western Union Company be dismissed, with costs, on the grounds set forth.

### A Telegraphers' Society Organized.

The statement in the last issue of THE OPERATOR, that a meeting of prominent telegraphers had been called for Sunday afternoon, May 22, to organize a society to protect the interests of the fraternity, drew together a good representation of operators. The committee appointed at the previous meeting to draft a constitution reported, and after some discussion, the constitution as reported was adopted. It states that the object shall be the improvement of its members by industry, economy and sobriety; that the organization shall be composed of a District Council and sub-districts, or branches; that the branches shall control their own funds, etc., and that the initiation fee shall be \$1, and monthly dues 50 cents, which shall be deposited to the credit of individual members, there being no expense connected with the maintenance of the society.

Seven members may open a branch, but a membership of fifteen is necessary before it can be represented in the District Council.

Five branches have already been opened, one in Jersey City, two each in New York and Brooklyn; and it is expected that three more will be started in a few days.

The organization already comprises over 150 members, making it an assured success. Those desiring to join the society, or wishing further particulars concerning it, can be accommodated by applying to the Secretary, Mr. J. B. Taltavall, of the Associated Press office, this city.

### Answers to Correspondents.

AMBITION.—Yes, we think you cannot do better than commence to study "telegrafting" at once. You do not spell or write as well as you might, but that is of little consequence. There is plenty of room, and operators are in great demand. The work is ridiculously easy—from 11.30 A. M. to 2 P. M. on week days, with an hour for dinner (paid for by the company), and no Sunday work—and an immense salary. Jay Gould gives each operator \$5,000 every Christmas, and if Vanderbilt gives anything, Gould "sees" him and goes \$1,500 better, so that the operators get rich quickly. If you feel tired after sending a dozen messages or so there are barber's chairs and foot-rests on which to revive, and a pool table in the coat room to divert the overworked mind. If you want to take a vacation for three months or so, you are expected to notify the company in advance, so that the officials can send on your salary by express; in addition to which you can use the company's yacht. Yes, we would advise you not only to learn the business at once but also to tell all your friends to "get on to it." You must, however, commence as a pole-climber, and gradually "work upward."

### A Telegraphers' Duel.

A dispatch from Charlotte, N. C., on the 11th ult., says: A remarkable affair of honor took place at Gastonia, between this place and Columbia, S. C., last night. The novel feature of the affair is that the insult and challenge were both given and the hostile cartel accepted by telegraph, and the combatants were both telegraph operators. Reginald de Fevre, a well-known telegraph operator in this place, in an irritable moment received an insult from John Cone, an operator at Greenville, S. C. Though the two men had never seen each other, De Fevre could not forget the insult. He has been considered one of the best natured men in the telegraph service, and was noted for the even-

ness of his temper under the most trying circumstances. But the Greenville insult was too much for him. Finally, after some bickering, they agreed to meet on half-way ground and fight a duel. The arrangements were completed for a meeting, and yesterday afternoon two telegraph operators in new dusters got off the train at Gastonia. They bowed frigidly to each other, and left for the hotel accompanied by friends. It was decided that instead of the pistol duel practice the parties should meet in an old field and settle the difference in man-to-man fashion by a square stand-up-and-knock-down contest. In order to prevent interference the hour fixed for the meeting was 1 o'clock in the morning. The moon was shining brightly when the two men, accompanied by seconds, met on the field. De Fevre was a light-weight, while Cone turned the scales at 170. After a close contest the heavy weight told and the Charlotte man was beaten. It was a hard fight, and the men were badly punished.

### Cleveland Chronicles.

To the Editor of The Operator:

SIR: Sickness has kept us from business for several months, and our ear had grown quite lonely without having behind it the wonted pen, but we rejoice in our ability to once more appear on deck and trust that the storm will not again drive us down in the hold.

During the past month we have visited some of our neighboring towns, where we met several of those with whom we had worked for years, but whose faces we had not before seen, and although we had formed in the album of our fancy a picture of each, we found the original in each instance superior to the picture, and in point of hospitality beyond our most sanguine expectations; and we hereby extend our thanks to those whose favors added to our pleasure while we were "innocence abroad." Prominent among them are Messrs. E. M. Boynton, the whole-souled and popular Manager of the W. U. office, Meadville, Pa.; J. M. Stinson, Manager, Greenville, Pa., and G. C. Gillis, Manager, Jefferson, Ohio.

On getting into our working harness again, we are like the buggy that stood in the barn all winter: rather rusty, but with a little usage will be as bright as ever. Looking about us, we notice many new faces, whose names are conundrums to us yet, but we hope to solve them in our next letter. A new feature of the office here is the "C. N. D." and Gold and Stock business, under the management of Mr. L. A. Somers, one of the veterans in the business, whose headquarters in the same capacity for many years has been the Cleveland Dock office. On and after June 1, and for sanitary reasons, the force here are obliged to es-chew tobacco, and, of course, must not expectorate as first-class men. This is a step toward morality. Who can suggest something else?

The American Union office, under the management of Mr. George H. Wadsworth, is still open, and so are our mouths, in anticipation of something dreadful to come, though down in the silent chambers of our hearts there is a hope that, whether we are ordered to report at the American Union office or the American Union boys come to us, we may all be amply provided for and everything blend harmoniously.

Messrs. C. F. Williams, formerly chief operator, and Geo. O. Smith, bookkeeper for the A. & P. Co., are among those provided for by the Western Union. Mr. D. L. Kaine, of the day force here, has resigned to accept a more lucrative position and be with his brother "Jim," at Kansas City. A few days since we dropped in to see Mr. E. G. Stevens, Manager general telegraph office N. Y., P. & O. Railroad, at 323 Euclid avenue, this city, and found him nicely situated. "Ed" is not only a genial gentleman, but an excellent operator. He is ably assisted by Mr. D. B. Campbell. Mr. Stevens still insists that the cipher of Stevens (— —) should take the place of the Morse cipher (—). The poet Lytton says: "Whom first we love, you know we seldom wed," but in the endeavor to supplant some other system in the place of Morse, we fear that he would learn that we have become wedded to our first love, the poet's idea to the contrary, notwithstanding. Mr. E. W. Baum, one of the owls of this office, has been presented with a fine boy, and is now looking up a name for him. Don't

load him down with a long cognomen, Ed., it would blight his young life. Mr. W. W. Sylvester, one of "ye old timers" in the telegraph profession, is private secretary to Mr. P. D. Cooper, Genl. Supt. N. Y., P. & O. Railroad. Mr. H. W. Jeffers, of the day force here, has been ruralizing for a few days, and comes back to us looking the better for a few breaths of country air.

We are indebted to Mr. P. C. Greenwell (Brutus) for taking up the chronicles where we left off, and to "Werner" for kind words, which inspire us with new hope. In our next chronicles we will strive to gather some news relative to business and business changes generally, and until then—well—  
"I. DUNNO."

### The Telegraph in Indianapolis, Ind.

To the Editor of The Operator:

SIR: The Western Union main office in Indianapolis consists in all of eight rooms, divided as follows: Superintendent, three; receiving and delivery departments, one; battery rooms, two; store-room, one, and operating room, one. The latter room is entirely too small and also poorly ventilated. The Manager states, however, that it is contemplated adding another good-sized room, which will greatly improve matters. They have seventy-three wires on the switchboard, six of which are city lines; five sets of quadruplex and five duplex; employ nineteen main batteries, consisting of two thousand four hundred cells, besides three hundred and fifty cells of local battery. The A. & P. office was closed March 19, and the A. U. April 15. All of the A. U. force are now with the W. U., Manager Sabold temporarily acting as one of the day chiefs. Following is the force: Mr. M. D. Butler, Manager; Mr. H. C. Sickles, Day Chief, with Messrs. F. W. Sabold and F. A. Moore, assistants. There are twenty-four operators on the day force. Mr. J. A. Fuller has charge at night, with a force of ten operators. A more brilliant and courteous corps would be hard to find. It will, no doubt, be a surprise to some of the craft, especially in the East, to learn of the immense amount of business done at this inland city. The following shows the actual number of messages handled during the months of April and May, 1880 and 1881:

April, 1880—City business.....	21,854
Repeated business.....	66,947
April, 1881—City business.....	29,629
Repeated business.....	93,205
First 25 days of May, 1880—City business.....	19,029
First 25 days of May, 1881—City business.....	23,508
Repeated business first 25 days of May, 1880.....	56,527
Repeated business first 25 days of May, 1881.....	90,122

Two press circuits are also worked almost constantly. This great volume of business handled by so small a force reflects very creditably upon the management as well as the operators, whose daily averages hover in the vicinity of 200 messages per operator. There are also eight branch offices in the city, the principal one being the Board of Trade, managed by Mr. Chas. E. Tweed. The others are located at the hotels, stock yards and the Gilliland Electric Manufacturing Company's factory.  
J. R. C.

### Indianapolis Inklings.

To the Editor of The Operator:

SIR: We have recently had the pleasure of a visit from the energetic general agent of THE OPERATOR, Mr. J. R. Calder, who during the few days he was with us succeeded in obtaining the subscriptions of nearly all the operators and clerks of this office, and of the various railroad offices in the city, as well as in appointing agents and correspondents at the numerous railroad headquarters located here. We trust that the operators in the various other cities Mr. Calder may visit will show the same lively interest in our representative paper.

We note the following changes since our last report: Mr. Morris Dougherty, recently arrived from Galion, Ohio; Mr. Chas. Banworth, from St. Louis, reported for extra duty on the 27th; Frank Farley also arrived from the West on the 28th; Mr. James P. Golden is expected to arrive from Columbus, Ohio, next week, and will be immediately added to the extra force; Mr. J. E. Ball left for Chicago on the 15th, where he intends making his fortune working extra; Mr. Mat. Leonard has gone back to his first love, the I., D. & S. Ry., and is now working at their headquarters in this city; Mr. Samuel Crull has con-

cluded that he can "O.S." trains better than handle commercial business, and has gone with the Penn. & Chicago R. R.; Harry Carlton, chief train dispatcher of the I. & St. L. Ry. has been confined to his room for the past week with pneumonia, but is again able to resume his responsible duties.

This office can boast of some of the oldest telegraphers in the country, including Supt. J. F. Wallick, Mr. J. W. Chapin, now with the Gold & Stock Co., Alfred Winder, all-night operator, and J. C. Wilson, none of whom have seen less than 30 years' service. Business has increased wonderfully in the past three weeks, so much so that we are compelled to "double up" forces night and day, and every man that shows himself around the office is "stuck" for a certainty.  
May 27, 1881.  
DUG.

### Milwaukee Melange.

To the Editor of The Operator:

SIR: The recent acquisition by the W. U. of the N. W. Telegraph Company is hailed as the beginning of an era of prosperity for the underpaid employees of the latter. In a recent interview, General Supt. Clowry, of the W. U., stated that the consolidation is an assured fact, the ratification by the Northwestern being a mere matter of form, as the principal stockholders were present at the time the lease was effected.

The contemplated changes incident to the new order of things will include the employment of more and better men, at salaries commensurate with their abilities, which will insure an improved service in all respects. This absorption is as joyfully greeted by operators as that of the American Union was deplored.

Mr. C. H. Haskins, the present General Superintendent of the Northwestern will, it is understood, devote himself exclusively to matters telephonic, in which he is already largely interested. The plans of Mr. R. H. Hankinson, the Assistant General Superintendent, located at Minneapolis, are as yet unknown. Everything is extremely uncertain regarding the expected changes at 89 Michigan, but it is supposed that the present efficient manager, Mr. A. Weller, will be retained, though it is probable that one or two chieftainships will be rendered unnecessary. It is rumored that there will be some changes made in the managements of certain prominent Western offices, but this is, of course, not authenticated. It seems quite evident however that, whatever is done, the operators will be benefited by the change. Among the office changes we note the departure of Mr. J. M. Marlet, for a visit to his Canadian home, and of Mr. O. C. Wells, resigned on account of ill-health. Mr. Chase, of Spencer, Ind., fills the latter's place, and Mr. McDermott, of Kenosha, is temporarily employed during the former's absence.  
OCTOPUS.

### A Popular Telegrapher Killed.

To the Editor of The Operator:

SIR: It is a sad duty to chronicle the death of any member of our profession, and sadder still when death removes from our midst one so universally admired for his brilliant genius and so ardently loved for his manly qualities as was Geo. B. Hunt.

Monday last Mr. Hunt left his home to attend to some business, after attending to which, while on his way to his post of duty he was killed by the falling of a derrick. The car on which he was riding caught a guy rope of a portable derrick standing in front of the Dorris Row, on Olive, between 11th and 12th sts., and pulled the heavy frame work off the derrick down upon the car, breaking down the rear canopy and crushing out the life of Mr. Hunt. His death was instantaneous.

The remains were taken in charge by the Knights of Pythias, of which order he was an honored member, and on Wednesday morning, after appropriate ceremonies, were conveyed to their last resting-place—that beautiful city of the dead—Bellefontaine Cemetery.

The fraternity in this city have subscribed nearly \$500 for the benefit of his widow, and the Pythian Knights have defrayed the expenses of the funeral. Mr. Hunt was about thirty-six years of age. He leaves a wife and two small children, aged respectively two and six. He came to St. Louis about five years ago, from Arkansas,

where he had been practicing law, and has worked here since, first with the W. U., then with the A. & P., and after that office closed he came back to the W. U. Aside from his ability as a telegrapher, he was a perfect gentleman and had hosts of admiring friends.  
X.

St. Louis, Mo., May 27, 1881.

### TELEPHONE DEPARTMENT.

The Peekskill (N. Y.) Telephone Company has been organized, and is about ready to commence business.

A whisper is no test for the capabilities of a speaking telephone. A transmitter that will not transmit a word of speech in an ordinary tone will frequently transmit a whisper perfectly well.

The Boston and Northern Telephone Company, a corporation operating under a license from the American Bell Telephone Company, and connecting by their wires many of the New England cities, have petitioned the Board of Aldermen of Lynn, Mass., for the right to lay wires under ground, and also to furnish electric lights.

The Hannibal Exchange has one hundred and forty subscribers, and is connected with New London, the county seat of Ralls County, twelve miles distant. Palmyra, fourteen miles distant will also shortly be connected with the Hannibal Exchange. The Exchange has the reputation in Hannibal of doing good service. They are having a new switch-board made by the Gilliland Electric Manufacturing Company.

The Gilliland Electric Manufacturing Company of Indianapolis will ship shortly complete outfits for telephone exchanges in Chili, South America. The Chilians are the most progressive nation of our southern hemisphere, and are closely adopting American methods and ideas. This company is now sending its work to all the countries of Europe, and expect to be patronized soon by India, China and Japan.—*Indianapolis News.*

According to a report from Vienna the first step towards the practical application of the invention of telephones has at last been made in the Austrian capital. The Vienna Local Telegraph Company has applied for and has been granted a concession to establish telephonic communication in the city. In granting the privilege the government has made two conditions—first, that the subscription should be as low as possible; and secondly, that telephonic communication should in certain cases come under control, as is the case with telegraphic communication. The first condition has been fulfilled already by the company intending to limit the amount of subscription to from 100 to 140 florins a year.

Mr. James Gamble, General Superintendent of the Western Union Telegraph Company at San Francisco, suggests that the telegraph might be used successfully in Arctic explorations. His plan would be to use light steel wire, weighing about twenty pounds to the mile, which, coiled on reels, could be hauled on sledges either by men or dogs over the snow or ice, paying it out as the advance exploring party went along, using telegraph or telephone as they saw fit. By this means the party would keep in constant communication with their base of supplies. As hard frozen ground, dry snow or ice is a perfect insulator, no poles would be required. Mr. Gamble is an experienced telegrapher, and his scheme should receive mature consideration. Mr. George Kennan, of Washington, who is an authority on Arctic exploration, says that this scheme is not feasible.

In Supreme Court Chambers, on the 21st ult., Judge Donohue, on the application of the Attorney General, granted a temporary injunction restraining the Metropolitan Telephone and Telegraph Company from erecting poles in Twenty-first street, between Fifth and Sixth avenues. This action, although in the name of the Attorney General, is brought in the interest of the property-holders on the street named. An order directing the defendant to show cause why the injunction should not be made perpetual was granted by the same judge. The claim of plaintiff is that there is no authority for maintaining poles where they encumber the street or become a nuisance, and that the proper place for such wires is under ground. Defendants say telephone

wires cannot be run under ground, and the reply of plaintiff to this is, that if they cannot run under ground they cannot run anywhere.]

The Merchants' Telephone & Telegraph Co., main office at the Union Depot, Kansas City, Mo., is organized under the laws of the State of Kansas and under contract with the American Bell Telephone Company. This company propose to build telephone lines connecting interior towns, county-seats and villages with their nearest railroad station, connecting stations with each other and with important terminal points; also to establish exchanges where the business will warrant it. Exchanges have already been opened in the following cities in Kansas: Emporia, Lawrence, Ottawa, Olathe, Fort Scott and Wichita, and it is expected that connecting lines between Kansas City and Leavenworth, Kansas City and Atchison and Kansas City and Topeka will shortly be built. The following are the officers of the company: Wm. C. Alberger, President; J. D. Cruise, Secretary; P. W. Bossart, Superintendent.

Mr. T. G. Ellsworth, manager of the John street office of the Metropolitan Telephone and Telegraph Company, of this city, has patented an improved telephone central office system, the principal object of which is to facilitate connection between wires of telephone lines in a telephone central office, and to afford means for making such connections rapidly and accurately. Ordinarily in telephone central offices mistakes and delays in connecting and disconnecting the wires of communicating parties are of frequent occurrence, for the reason, among others, that the operator at the telephone cannot conveniently, or does not himself, connect and disconnect the wires, but gives directions to others to do so; hence result much noise and confusion, and consequent misunderstanding and forgetfulness or neglect of duty.

To avoid these difficulties Mr. Ellsworth has devised a system involving the use of novel switch connections and of novel telephone stands, and their peculiar arrangement relative to each other, whereby each telephone operator is enabled easily and without delay to connect and disconnect several communicating wires that are connected with his instrument.—*Scientific American*.

The factory of the Gilliland Electric Manufacturing Company is situated in the suburbs of Indianapolis, but connected with the Telephone Exchange of that city, besides having a branch office of the W. U. Telegraph Company, the wire being put in expressly for the G. E. M. Co.'s business. Several recent heavy orders, both from the foreign and domestic trade, will keep the factory very busy for some time to come. They, however, have improvements in view which will afford more room and facilitate the filling of orders. The extensiveness of the works can be judged from the fact that the employes number over one hundred and fifty, all having the appearance of being skillful and intelligent, an hypothesis which the well-known character of their goods certainly confirms. Mr. E. T. Gilliland, the General Manager, and his brother, Mr. J. F. Gilliland, Superintendent, heartily enter into all the enjoyments and games of their hands, having provided for them base-ball grounds and croquet grounds, the latter being for the female employes. In a recent base-ball game the Mag-netos of the G. E. M. Co. defeated a W. U. picked nine by a score of 22 to 6. During the month of June an excursion has been arranged for the employes and their friends to Lake Manitou, some ninety-five miles north of Indianapolis.

A committee of the Philadelphia City Councils has reported favorably an ordinance granting privileges to the Bell Telephone Co., for erecting poles and stringing wires, under which that company will put up 2,000 miles of wire in the city. The company must, however, file bonds agreeing not to charge more than the rates set forth in the classes following:

Class No. 1.—Includes dwellings throughout the city, the price per annum, with two or more on one wire, shall not exceed the sum of \$40, and where any of this class desire the exclusive use of one wire, the price shall not exceed that charged in Class No. 2.

Class No. 2.—Includes all business men, firms and corporations with two on one wire, the price per annum to be charged for the first mile shall not exceed \$75, and for any distance greater

than one mile an additional sum not exceeding 30 per cent. per mile may be charged.

Class No. 3.—Includes all business men, firms and corporations having the exclusive use of one wire, the price to be charged for the first mile shall not exceed \$100 and for any distance greater than one mile an additional sum, not exceeding 30 per cent. per mile shall be charged; and

Provided, That in cases with an average of fifteen calls per day or more on a wire, special contracts may be made.

## DASHES HERE AND THERE.

The island of Jamaica has now 470 miles of wire, with 32 stations, and 35 operators—all females.

One hundred operators are now employed in the W. U. office at St. Louis, Mo., 20 of whom are ladies.

The advertisement of Messrs. Ordway & Co., merchant tailors, of Chicago, will be found of interest to many of our readers.

On Friday last the Faraday reported herself five hundred miles out on the ocean, with all on board well. The signals and insulation are perfect. She will proceed to London for the remainder of the cable.

A company has been organized in Boston to work the Brush electric light, and lighted up Scollay Square for the first time on Tuesday night, May 17. Arrangements are already completed to furnish with electric lights the Tremont House, Young's Hotel, the Crawford House and several drug stores. It is intended to keep the Scollay Square lights burning all night.

Mr. N. R. Young, manager of the Chattanooga, Tenn., W. U. office, sent 1,500 pounds of supplies to the Nashville office after the fire. There are several offices up this way that could not spare 1,500 pounds of supplies to a neighboring office in distress, owing to a *penchant* some superintendents have for "revising" the requisitions that are sent in.

Mr. J. Pettibone, of Baltimore, sent a message by the American Rapid Company to Washington. The message reached that city all right, but the messenger boy to whom it was intrusted for delivery got into a fight with another boy and lost the message. Mr. Pettibone has, in consequence, sued the company for \$10,000 for non-delivery.

The cable steamer "Dacia" has repaired the Key West and Havana Cable. The operation is a difficult one, owing to the strong currents and to the fact that cables lie in close proximity and cross each other in some places, besides being deeply imbedded in sand. More than ten tons resistance is necessary to raise the cable, which was 4 times grappled, and each time broke loose.

About twenty-five boys employed by the American District Telegraph Company, in Brooklyn, struck on the 16th ult. for higher wages and less work. The strikers have heretofore received \$3.60 a week, and have been compelled to work twelve hours. They demanded \$4 a week and nine hours' work; but their demands were not acceded to, and new boys were hired in place of the strikers.

Last year a treatise was issued on "Electricity and Magnetism" by J. E. H. Gordon, a Bachelor of Arts of Cambridge University. The work is reviewed in the *Journal of the Telegraph* by D. F. In view of the fact that the review in question is headed "A Physical Treatise on Electricity and Magnetism. By J. E. H. Gordon and B. A. Camb," the signature would seem to be not altogether an unfounded suggestion.

At the annual meeting of the American District Company in Philadelphia, on the 16th ult., it was shown that in that city the company has in service 506 telegraph call instruments, and 37 alarm instruments in dwellings; 799,068 telegrams were delivered and 217,353 received during the year; 222 messengers are employed; 4,789,920 circulars were delivered, and the present worth of the plant is \$393,938.02.

The Kawsmouth Electric Light Company, capital \$100,000, has been incorporated at Kansas City, Mo. It is working under franchises from the United States Electric Lighting Company (Maxim patents), and has introduced the light with success in Kansas City. S. T. Smith, Supt. K. P. Ry. is President of the company; W.

C. Alberger, Supt. H. & St. Jo. Ry., Vice-President, and Paul W. Bossart, Electrician.

At a meeting of the Socialists in this city, on the 21st ult., the following telegram was sent to the Czar: "Four thousand American citizens, in mass meeting assembled, protest against Hussy Helfman's execution. Let not the blood of this woman be upon your head." As the company will not accept "collect" messages to St. Petersburg, and as the system of red messages has not yet been extended there, the Socialists had to pay full rates on it.

An order has been issued prohibiting the operators of the N. W. Telegraph Co. from acting as newspaper correspondents. The W. U. some time ago issued a similar one to its employes. The reason assigned is that if an operator desired, when an important piece of news came in from a correspondent, he could, instead of sending at once to the paper to which it was directed, change its phraseology and send it first to the publications of which he was the correspondent.

The Signal Service Corps has a force of 500 enlisted men—150 sergeants, 30 corporals and 320 privates. The term of enlistment is five years. Pay ranges as follows per month: Sergeants, \$80 so \$98; corporals, \$65 to \$85; privates, \$58 to \$81. As a spur to efficient work, the head of the corps is authorized by law to promote two enlisted men each year to lieutenantcies. It costs about \$375,000 a year to run the bureau, aside from the pay of officers and enlisted men.

One night last month, some time between 11 and 12 o'clock, that part of London which extends from Blackfriars Bridge up Ludgate Hill to St. Paul's churchyard and down Cheapside to King and Queen streets was suddenly in utter darkness. This was the area illuminated by the electric lights on the Brush system. Something had gone amiss, but exactly what it was those in charge of the electrical apparatus could not discover. Finally the ancient gas connections, which had not been disturbed, were brought once more into use.

A dispatch from Europe reports that M. Camille Faure has discovered a method of storing up and compressing galvanic electricity, and that he has shipped a box of it to Sir William Thomson. A similar reservoir for electricity was said to have been discovered by an electrician in this city about two years ago, but it was not exhibited nor described. If electric energy can be stored up like water and drawn off as required for use, which seems from its nature as far as known to be impossible, the success of the electric light systems would be assured.

Mr. Edison says that this is an old invention, and that he himself, two years ago, patented and applied a method for using the Planté battery in connection with electric lighting.

Anastasia Morrissey arrived in this country from Ireland some months ago, and sent a dispatch from Castle Garden to her aunt. The dispatch was intercepted by two men who went to Castle Garden and informed the girl that they had been sent for her by her aunt. Something in the appearance of the men aroused the girl's suspicions, and she learned before harm befell her that they did not even know Mrs. Dwyer, and that they had sinister designs. A suit was commenced by the girl to recover \$1,000 from the Western Union Company for the miscarriage of her dispatch. The plaintiff, who is only 18 years of age, recovered a verdict of \$150.

## NEW YORK CITY ITEMS.

### Echoes From 195.

A little stranger has appeared in the household of Mr. D. Harmon, Jr.—a girl.

On Monday last Minnie Cooke distributed 706 messages on the Southern circuits in one hour. This is smart work.

Mr. Fred Cooke has resigned his position in the W. U. main office to engage in other business at Worcester, Mass. Mr. Cooke was a favorite in 195, his pleasant and genial manners having made him many friends.

Mr. W. D. Chandler has resigned his position at 195 Broadway, owing to impaired health. His new field of duty is in Cheyenne, Wyoming. During his stay in this city he made a very favorable impression, both as a telegrapher and a gentleman.

At 12 P. M., on the 20th ult., there were 25 cir-

cuits working direct between New York and Chicago. The former office was sending on 20 and receiving on 5 circuits. In addition to the regular business, not less than 150,000 words of special were exchanged.

The text of the New Testament was transmitted to Chicago on the evening of May 20. It consisted of 110,000 words, and was started on four wires at 5:30 P. M. At 6 P. M. eight wires were used; at 7:30 P. M. 16 wires, and at 8:45 P. M. 20 wires. It was finished at 12:20 A. M. This is considered, in many respects, the greatest feat ever accomplished in telegraphy. Mr. Morris Brick kept track of the numbers and attended to the orderly transmission of about 200 sheets on the various wires.

The spring games of the Western Union Athletic Association took place, as announced, on Thursday afternoon, May 19.

The first contest was a 100-yard dash, handicap trial heats, the winner to run in the messengers' final heat. There were four heats. The first was won by J. J. McKinnery in 13 $\frac{3}{8}$  seconds. The second heat was won by W. B. Richmond in 11 $\frac{3}{8}$  seconds. The other two were walk-overs by Hugo Wiese and A. J. Voyer.

The next was a walking contest of one mile. C. E. Davis was the victor, making the distance in 9m. 54 $\frac{1}{8}$ s. W. H. McLean was second.

Then came the half-mile run. Martin Durivan accomplished it first in 2m. 16 $\frac{5}{8}$ s. E. H. Nicholls was second. J. J. McKinnery started only and then fell out.

The messengers' race in uniforms; trial heats, the first and second to run in the end, then followed. This was half a mile. James Donahue won the first heat in 2m. 44 $\frac{1}{8}$ s., and James H. Dunn the second heat in 2m. 40s.

A mile walk, handicap, was won by G. Casey in 8m. 16 $\frac{5}{8}$ s. J. P. Brattens second.

The quarter-mile run was won by J. J. McKinnery in 1m. 11 $\frac{1}{8}$ s. Hugo Wiese was second.

The running long jump had but two contestants, McKinnery and Wiese. The former was winner, his longest jump being 18 ft. 7 $\frac{3}{4}$  in.; another jump was 18 ft.

In the messenger's final heat, James H. Dunn was winner, T. Ayres second and James Donahue third.

The one-mile run was most spirited. There were but two in the race—Martin Durivan and Thomas Marrin. Marrin led all the way till the last turn of the course, which was an eighth of a mile in length, and then Durivan passed his antagonist easily, and gained the race in 5 min. 19 $\frac{1}{8}$  sec.

A hurdle race of 220 yards, five hurdles to jump, was contested by J. J. Kinnery, Hugo Wiese and W. B. Richmond. The latter won in 30 $\frac{3}{8}$  sec. Wiese fell heavily near the last hurdle, and lay motionless. It was at first thought he had been seriously injured. A doctor who was present brought him round. He had fainted from the shock and exhaustion.

The tug-of-war on the programme was omitted. The first prizes were gold medals and the second silver.

#### Other City Items.

The picture gallery of the Union League club-house was recently illuminated by the Maxim light, without detracting from the harmony of color or richness of tint in the beautiful paintings.

Mr. Henry Van Hoevenbergh, electrician of the American Union Telegraph Company, has taken a leave of absence and is off in the Adirondacks, forty miles from the nearest town, superintending the erection of his big log hotel, which he calls Camp Comfort.

On May 2 Samuel Boyce, while beating carpets on the roof of the Stevens House, leaned against a chimney to which telegraph wires were attached. The weight of the wires had so weakened the chimney that, under the additional weight of Boyce, it gave way. Boyce fell with it and was killed. A Coroner's jury censured telegraph companies for using chimneys as supports for their wires.

#### PERSONAL.

Mr. William Wallace, of Augusta, Ga., has gone to Springfield, O., on a visit.

Mr. C. A. Garland has been appointed Manager of the Selma, Ala., office, Wm. Nettles retiring.

Mr. Frank A. Armstrong, Manager of the Western Union Company at Cincinnati, has resigned.

Mr. William F. Corbit, for many years connected with the Associated Press in Philadelphia, is dead.

It is proposed in England to confer a baronetcy upon Mr. John Pender, the famous cable manager and owner.

Mr. Arthur Doty, formerly of the Chattanooga W. U. office, has charge of the telephone exchange, same city.

Mr. S. B. Sheibley, of Chattanooga, Tenn., has left for New York, to rusticate through the East for the summer.

Mr. G. T. Williams, Superintendent of the Western Union Seventh district, with headquarters at Cincinnati, has resigned.

Albert E. Smith, operator for the F. W. & J. R. R., at Mosherville, Mich., will not be thirteen years of age until next September.

Samuel A. Munson, a wealthy resident of Utica, N. Y., and for some years one of the directors of the Western Union Telegraph Company, died on the 26th ult., in his 56th year.

A lady operator, who has had several years W. U. experience, will give large commission for situation in country office. Address, with full particulars, CONFIDENCE, care this office.

Frank Gould, telegraph operator, was struck by an engine at Forester, Ind., May 16, and dangerously injured internally. He was riding on the engine pilot and fell when getting off.

Any person knowing the present address of Miss Nina Hickok, formerly operator at Oxford, Mass., will confer a great favor by dropping a postal card with her address to "Operator, R. & A. R. R., Columbia, Va."

Emile Berliner, for the last four years an electrician in the service of the National and American Bell Telephone companies, sailed on Saturday, May 21, for England, whence, after a short sojourn, he leaves for his native city, Hanover.

Mr. H. C. Wilson, an old and experienced telegrapher, is superintendent of the postal telegraph service in the island of Jamaica. Mr. Wilson was at one time employed by the old "Electric" Company in England; served three years in Egypt, and some years in Pernambuco and Bolivia.

Mr. Jule P. Wooten, who resigned at Chattanooga some six weeks ago to accept a position with the Mexican Telegraph Company at Tampico, and was afterward thrown out of employment, has been reinstated and transferred to Vera Cruz, which gives him a better chance for the City of Mexico when opened.

Mr. J. K. Butler, of Stamford, Conn., has resigned his position as manager of the W. U. office at that place, after eighteen years' faithful service, to accept the general management of the Stamford and Norwalk Telephone Company, with which, however, he has been prominently connected since its inception.

Mr. Joseph H. W. Hoogs, of the Boston W. U. office, died at his father's residence, May 22, of consumption, aged 25 years. Mr. Hoogs gave up work about a year ago on account of ill health. He had up to that time been one of the best telegraph operators in Boston, and had hosts of friends, not only in the office, but along the whole length of the line.

INDIANAPOLIS, IND.—The first base-ball game of the season occurred May 21, between the Western Union nine and the Gilliland Electric nine, on the latter's grounds, near the Gilliland Electric Manufacturing Company's factory. The result was a victory for the Gilliland boys, in a score of 18 to 6. This was owing mainly to bad pitching on the part of the W. Us., their regular pitcher having sprained his arm in the third inning. They play again in two weeks, when a close game is expected.

The three daughters of Gardiner G. Hubbard, formerly of Cambridge, Mass., and well known to

telegraph men as the indefatigable promoter of the Government Telegraph scheme, have married foreigners. One is the wife of Professor Bell, the inventor of the telephone and the photophone, the second of Mr. Grossman, a Hungarian, and the third was married last week to Charles James Bell, of Leeds, England. The latter gentleman is the cousin of the telephone inventor, and is himself the inventor of an instrument for registering telephone messages.

Mr. L. A. Gobright, who was for many years the Washington agent of the Associated Press, died in that city on the 14th ult. He was born in Baltimore in 1816 and removed to Washington in 1834, where he always afterward resided. His connection with Washington journalism began almost with his removal to the capital, and he was one of the earliest officers of the Associated Press, which he served in a most responsible capacity until the 1st of July, 1879, when he resigned. The journalists and public men of nearly half a century honored Mr. Gobright with their confidence, and he never forfeited their esteem.

RICHMOND & ALLEGHENY R. R.—Your nice little paper has found its way on this line, and I think your readers would like to know what we are doing over here. This telegraph line was started last September, and we now have 227 miles of wire and 20 offices and will have about 10 more when we get the road through. We have Jno. Cakie, late of the R. & D. R. R.; Mell Kembrough, late of the R. & P.; Jno. Burgess of the Air Line, and Mr. Creamer, of the A. U. T. Co. The line is working very well, and we are all happy and read THE OPERATOR with pleasure.

VIRGINIA.

Mr. W. H. Mayer, formerly of the N. Y. Elevated Ry., is now very pleasantly situated at Topeka, Kansas, on the A., T. & S. F. Ry., having charge of their telegraph office at their shops. He gives our General Agent the following changes: Mr. H. M. Roach, formerly day operator U. P. Ry., Topeka, transferred to night duty, Wamego, Kans. (the terminal station of the Kaw River Division); Mr. W. A. Campbell, formerly night operator, has been transferred to day duty; Mr. Roy Connor, formerly nights, Lawrence, U. P. Ry., filling the position of night operator vacated by Mr. Roach.

#### MARRIED.

FISHER—STANLEY.—May 4, at the residence of the bride, Rossville, Kan., by Rev. G. H. Nickerson, Mr. Geo. Z. Fisher, manager at Wamego, Kan., to Miss L. E. Stanley.

HUDDLESTON—PERRY.—May 18, 1881, at the residence of the bride's father, Stevenson, Ala., by the Rev. John Cargile, Mr. Will Huddleston, night operator M. & C. R. R. Co., Stevenson, to Miss Kate Perry.

FAGAN—SCHUPPAN.—On May 11, at the residence of the bride's parents, Jersey City, by Rev. James Montgomery, Mr. George F. Fagan, Secretary's Office W. U. Tel. Co., New York, to Miss Bertha Schuppan.

JONES—KENNEDY.—May 18, 1881, at Clyde, N. Y., by the Rev. Mr. Reddy, of Syracuse, C. E. Jones, bookkeeper at the Clyde Glass Works, to Miss Mary L. Kennedy, of Chittenango, N. Y., for the last 6 years operator for the N. Y. C. R. R. at Clyde.

#### DIED.

PRINCE.—On Monday, May 23, Henry D. Prince, clerk and collector M. T. & T. office, 198 Broadway, New York, aged 31 years.

STONE.—May 11, in Chicago, of cholera infantum, Frank E., twin son of E. B. and Nellie D. Stone, aged 9 months and 9 days.

MURRAY.—At Kinzua, Pa., May 13, 1881, of pneumonia, Dana Ross, aged 6 months and 28 days, second son of Dan Murry, Manager and Lineman W. U. T. Co.

THE GIANT SOUNDER.

THE ORIGINAL AND GENUINE  
WITH LATEST IMPROVEMENTS.

J. H. BUNNELL'S PATENT, FEB. 16, 1875.

UNEQUALLED!

We call attention to the fact that we are making these unrivalled Sounders, our own original invention, with our latest improvements added, at a lower price than has ever before been reached. Every Sounder warranted first-class in all respects and with loud and clear tone. PRICE, \$5 00, carefully boxed and sent by mail, prepaid, to any part of the United States.

SEND FOR OUR CATALOGUE.

With extensive facilities and a large *new* stock, including the latest and best improvements ever introduced for all branches of Telegraphic service, we invite attention to our new large illustrated catalogue now in press, and to be ready for issue about May 25th. It will be sent *free* to any address.

Remittance may be sent by draft, postal money order, registered letter, or postage stamps.

C. O. D. orders sent to any distance if accompanied by cash amounting to one-third of the bill ordered.

STEEL LEVER KEY

LEGLESS PATTERN.

The same in all respects as our celebrated STEEL LEVER KEY, (which has become the accepted standard of perfection throughout the United States in less than six months' time since its first introduction) excepting that the base is made legless, or with "top connections." The entire key being handsomely finished, and making a beautiful and perfect instrument, suitable for use on fine desks or wherever a legless key is preferable. PRICE \$4.00, carefully boxed and sent by mail, prepaid, to any part of the U. S. Price of Regular Pattern (with legs), \$3.00.

SEND FOR OUR CATALOGUE.

Our system of prepaid delivery by mail of Keys, Sounders, Learners' Instruments and all small orders of less than 4 lbs. weight, at our reduced list prices, is a great advantage to purchasers at a distance, who are thereby enabled to receive these small orders delivery free at lowest New York prices.

20 OHM GIANT SOUNDER & STEEL LEVER KEY.

COMBINATION SET.

For Private Wires, Main Lines, etc., up to 25 miles in length—Warranted—consists of our standard first-class Giant Sounder, finely finished, with Rubber-Covered Coils, fine Silk-Covered Wire, wound to 20 ohms resistance, mounted on Polished Mahogany Base, with a Steel Lever Key, making the prettiest and most perfect set of short Main Line Instruments ever produced. PRICE \$8.00, carefully boxed and sent by mail, prepaid, to any part of the United States.

BOX SOUNDING RELAY & STEEL LEVER KEY,  
COMBINATION SET.

For Main Lines up to 600 miles in length. Of best construction for loud, or sound without local sounder. Polished Mahogany Box and Base; 150 ohms Silk Wire. Price, with Steel Lever Key on base, \$12.00: without Key, \$9.00.

**J. H. Bunnell & Co., 112 Liberty St., New York.**

# THE OPERATOR,

A JOURNAL OF

Telegraphic, Telephonic and Electrical  
Science, Literature, News and Progress.

PUBLISHED SEMI-MONTHLY.

Subscription, including Postage, \$1 per annum, in advance.  
To Foreign Countries in the Universal Postal Union, 25 cts. extra.

THE OPERATOR in effect sends each of its subscribers a long letter twice a month, containing all the telegraphic, telephonic and electrical news of interest to him that has occurred during the preceding two weeks, and also gives him in each issue several articles of great value on matters pertaining to his profession, from the pens of the most able and astute writers connected with the telegraph and telephone business. Its subscription list embraces all the prominent telegraph and telephone men in America, and many famous foreign ones, including Presidents, Vice-Presidents, Executive Officers, General, District and Railway Telegraph Superintendents, Managers, Operators, etc., and is increasing faster at the present time than ever before in the history of the paper.

For **One Dollar** subscribers receive in the course of a year 24 numbers, containing an average of **20 pages** each, being 480 pages, or 1,440 columns of interesting and instructive reading matter. This is equal in one year to over **2,000 pages of an ordinary book**; all for **One Dollar**.

## WHY EVERYBODY SHOULD READ "THE OPERATOR:"

It gives special attention to news, to gossip, to inventions, to the telephone, to the latest patents, to electrical progress, to all scientific news, to interesting personal news, to financial reports concerning the telegraph, to accurate and bright domestic and foreign correspondence, to biographical accounts and engravings of prominent telegraphers, to notes and queries on electricity and electro-magnetism and their applications, to changes occurring among telegraphers in all parts of the United States and Canada, to everything that, in fact, goes to make a first-class telegraphic newspaper. An average of

**TWENTY PAGES EVERY ISSUE,**

carefully edited in every department. A large and carefully chosen editorial staff. Intelligent and lively correspondents.

### AN ALBUM OF PROMINENT TELEGRAPHERS.

As an organ of opinion, THE OPERATOR is first, last and all the time for operators and their best interests. It circulates in every quarter of the globe, wherever the telegraph is worked. We are anxious to make the paper as efficient as the unstinted expenditure of money and the exercise of diligence and discrimination, with the aid of every modern appliance, can make it.

"Such a paper is only possible among an intelligent staff of men, such as work the American lines."—*Telegraph in America*.

Subscriptions can commence at any time.

A copy of THE OPERATOR will be sent from the present time until Jan. 1, 1882, on trial, for Fifty Cents. Postage Stamps taken.

### SPECIAL COMBINATION OFFERS:

Those wishing to subscribe to THE OPERATOR for the remainder of the present year, at the very low price of **50 CENTS UNTIL JAN. 1, 1882,**

can order some of the interesting books we publish at the same time at a considerable reduction from regular price.

For instance, for **ONE DOLLAR**, we will send, postage prepaid, THE OPERATOR, until Jan. 1, 1882, and a copy of either "Wired Love," or "Oakum Pickings," in cloth, or "Sam Johnson," in paper.

For **TWO DOLLARS** we will mail, prepaid, "The American Popular Dictionary," "Tales and History" (both cloth) and THE OPERATOR, until Jan. 1, 1882.

Or, for the same amount, we will send "Sam Johnson," "Tales and History" (both cloth), and THE OPERATOR, until Jan. 1, 1882.

Or, again, for **TWO DOLLARS** we will mail, postage prepaid, "Tales and History," "Wired Love," and "Oakum Pickings," all cloth.

With THE OPERATOR, until Jan. 1, 1882, added, **\$2.50.**

"Sam Johnson," paper, in connection with THE OPERATOR and the above three books, only **\$3.**

These are remarkably low prices for the above combinations, as you will acknowledge when you see the books. If you want some other combination not given on this page, let us know, and we will quote equally low price for it.

Remit by Post-Office Order, Draft, Registered Letter, or Express. Postage stamps taken.

W. J. JOHNSTON, Publisher,  
No. 9 MURRAY STREET, NEW YORK.

A BOOK THAT SHOULD HAVE A PLACE IN EVERY TELEGRAPH OFFICE.

# THE AMERICAN POPULAR DICTIONARY:

510 PAGES. STRONGLY BOUND IN CLOTH. PRICE ONLY \$1.

The publisher of the AMERICAN POPULAR DICTIONARY claims for it the support of telegraphers and the public, for the following among other reasons:

It contains every word of the English language that enters into speech or writing.

The Spelling of each word is that given by the best authorities.

The Definitions are compiled from a majority of the best writers of the English language.

The Pronunciation of every word is that settled upon by the ablest scholars.

In addition to the perfections of this work as a Dictionary, it contains a vast amount of information upon many kinds of useful information not to be found in any similar work; but all absolutely necessary to every one who wishes to be acquainted with the leading subjects of conversation and composition.

TELEGRAPHERS, more than any other class of men, need a good and handy Dictionary in their office at all times. There is no Dictionary published that will give them better satisfaction than **The American Popular**.

Dictionaries printed in England are of little use in this country, where many words are differently spelled, and the meaning not always the same. Send for the **American Popular Dictionary**, and get the best Dictionary at the price published.

The American Popular Dictionary is printed from new type, with extra clear and legible face, and handsomely bound in cloth and gilt. From it a speaker or writer can glean an amount of knowledge impossible to find elsewhere collected in one book.

Worth ten times the price.—*N. Y. Times*.

A perfect dictionary and library of reference.—*Leslie's Illus. News, N. Y.*

We have never seen its equal, either in price, finish or contents.—*Chris. Advocate*.

Copies promptly mailed, postage prepaid, on receipt of price, \$1, in currency or postage stamps, or by Post Office order. Liberal discount to agents.

Four copies by mail or express, prepaid, \$3.00.

THE OPERATOR for fifteen months and the Dictionary only \$2.00.

## TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY.

A POPULAR ACCOUNT OF

The Electric Telegraph: Its Uses, Extent and Outgrowths.

By W. J. JOHNSTON, Editor of THE OPERATOR.

254 PAGES. - - - CLOTH. PRICE, \$1.

This book has already met with the most gratifying success, both among telegraphers, press and public. The manager of a neighboring city writes: "During sixteen years' connection with the telegraph business, nothing I have read has proved so entertaining." A prominent telephone man says: "I glanced at the book to see what it was like, and did not stop till I had read every word in it." The *N. Y. Sun* recently devoted three-quarters of a column to a review of "Tales and History," and a London journal, just received, gives it nearly two columns.

"It is seldom that a book containing so much substantial and not easily accessible material of a specific kind is commended to a wide audience by a careful and pleasing literary treatment."—*N. Y. Sun*.

"The topic chosen by the author is a most interesting one, and by his thorough familiarity with the subject, theoretically and practically, he has succeeded in making not only a useful but a most amusing volume."—*N. Y. Times*.

Uniform in Size with "Tales and History" and "Oakum Pickings,"

## WIRED LOVE;

A ROMANCE OF DOTS AND DASHES.

BY ELLA CHEEVER THAYER.

The "Old, Old Story" in a New, New Way.

256 PAGES. HANDSOMELY BOUND IN CLOTH. PRICE, 75 CENTS.

Having already issued the FOURTH EDITION of this admirable Telegraphic Love Story (which fact sufficiently demonstrates its popularity, both in and out of the profession), Mr. Johnston takes pleasure in recommending the book to telegraphers and others as a most entertaining, bright, sprightly and amusing work, either for summer or winter reading.

## OAKUM PICKINGS:

A Miscellaneous Collection of Stories, Sketches, Essays, and Paragraphs, Telegraphic and General, By Walter P. Phillips, "John Oakum," with a fine Steel Plate Portrait of the Author.

Fourth Edition, 188 pp.; Medium 12mo; Paper, 50c.; Cloth, 75c.

The welcome accorded this, the first book ever published with the object of giving the telegraph profession a literature of its own, has been general and hearty, on the part of both telegraphers, press, and general reading public in all parts of the country. Mr. Phillips, the author, is well known to the fraternity as a spicy, original, witty, entertaining, and popular contributor to telegraphic and humorous literature, and his character sketches of "Jim Lawless," "Tip McClosky," "Posie Van Dusen," "Cap. De Costa," etc.—all of which are contained in *Oakum Pickings*—have won for him an enviable reputation as a humorous sketch writer.

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00  
The three books and THE OPERATOR one year, or any of our other \$1 books..... 2.75  
The three books, THE OPERATOR one year and The Dictionary, or any other \$1 book..... 3.50

"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with THE OPERATOR, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

## A. G. DAY, MANUFACTURER OF Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

### DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

### Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

### Kerite Insulated Wire and Cables

#### A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

For sale by all dealers in Telegraphic Materials.

A. G. DAY,  
120 Broadway, New York

## THE LAW BATTERY. THE GREATEST TELEPHONE BATTERY.

### PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL.

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**  
140 FULTON STREET, NEW YORK.

## TELEGRAPHIC SPECIALTIES.

THE GIANT SOUNDER PERFECTED.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5.00.

THE DELANY PATENT REVOLVING DISC,

OR UNIVERSAL PLATINA CONTACT KEY.

This key embraces the only positive remedy for sticking; obviates direct anvil pounding, and thereby prevents operators' paralysis. Legless, hard rubber base, nickel-plated, and the handsomest, most durable, and only perfect key manufactured. Price, \$5; by mail, \$5.35.

CHAMPION LIGHTNING ARRESTER.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

THE CHLORINE BATTERY.

D. H. Fitch Patent, Sept. 16, 1879. For telephones, burglar alarms, call bells, etc. Price per cell, \$1.75.

PREMIUM LEARNERS' APPARATUS.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS AND OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

Price, Complete Outfit	Money in advance, \$5.00

# BEATTY'S { CABINET OR PARLOR } ORGANS

It is with pleasure that I offer the most perfect musical combination and wonderful instrument ever made.

## THE "BEETHOVEN" NEW STYLE No. 9,000

which is destined to be the most popular Organ the world has ever seen. My success in the past having been so unprecedented, I am warranted in doing better than ever for my customers, hence this unparalleled offer. I have now the

### LARGEST FACTORY IN THE WORLD

that ships its products direct to the purchaser, avoiding extortionate profits, middlemen and agents, manufacturing my own Organs in my own factory, and being sure of selling thousands of this charming style every month. I offer this Organ, combining a grander variety of stop work, greater power, more musical effects, and the most elegant exterior, including a first-class stool, book and music, boxed and delivered on board the cars here, for only

**\$60.00**

**YOU CAN TEST IT IN YOUR OWN HOME, FREE OF EXPENSE, FOR ONE MONTH.**

It contains 27 Stops, 5 Octaves, 10 full sets of Golden Tongue Reeds, as follows:

Manual Sub-Bass, 16 feet tone,  
Diapason, 8 feet tone,  
Dulciana, 8 feet tone,  
Cello, 8 feet tone,  
French Horn, 8 feet tone,

Saxophone, 8 feet tone,  
Voix Celeste, 8 feet tone,  
Viola Dolce, 4 feet tone,  
Violina, 4 feet tone,  
Piccolo, 4 feet tone,

also, Coupler Harmonique, Harp Aeoline, Grand Expression Vox Humana, Vox Jubilante and other grand accessories as below.

### SPECIFICATION OF STOP WORK, 27 IN ALL.

1—Cello.  
2—Melodia.  
3—Clarabella.  
4—Manual Sub-Bass.  
5—Bourdon.  
6—Saxophone.  
7—Viol di Gamba.  
8—Diapason.  
9—Viola Dolce.

10—Grand Expressione.  
11—French Horn.  
12—Harp Aeoline.  
13—Vox Humana.  
14—Echo.  
15—Dulciana.  
16—Clarinet.  
17—Voix Celeste.  
18—Violina.

19—Vox Jubilante.  
20—Piccolo.  
21—Coupler Harmonique.  
22—Orchestral Forte.  
23—Grand Organ Knee Stop.  
24—Right Knee Stop.

27—Left Duplex Damper.

DIAPASON.		DULCIANA.	
CELLO.	VIOLA DOLCE.	FRENCH HORN.	VOIX CELESTE.
SUB-BASS.	SAXAPHONE.	VIOLINA.	PICCOLO.

Plan of Reedboard, entirely original.

**COME TO WASHINGTON, NEW JERSEY, AND SELECT AN ORGAN IN PERSON. YOU ARE CORDIALLY WELCOME.**

You will be afforded an opportunity to inspect everything and satisfy yourself in every particular. Beware!—I hesitatingly advise those who are about to order from other parties, not to do it. Order only the latest and best of all Organs. If you have already ordered, countermand your order, it may not be too late yet. An Organ lasts a lifetime, get only the latest style and best music combined. **Remit by Post Office Money Order, Express Prepaid, Bank Draft, or Registered Letter.** Money refunded and freight charges paid if all is not as represented. It is a well-known fact that I am the man that had the nerve to reduce the price of Pianos and Organs, in the face of untold abuse from the monopolist. The public should remember this and patronize the original not the imitator. REMEMBER any offer made (by imitators) no matter how low, I can beat it. **WEIGH THESE WORDS CAREFULLY.**—I dare ship you a poor instrument as it is not possible for me to know who will test it. Agents invariably conceal defects and claim advantages for Organs they sell. My instruments must be good enough to silence maligners and defamers. They invariably prove satisfactory. Thousands are now in use. **IT IS A FACT** that my business has increased to such proportions that even now with a factory having **ONE AND A HALF ACRES OF SPACE** within the walls of building, filled with skilled artisans and best machinery is the reason I can offer this Organ so low. I am now enlarging my factory **OVER DOUBLE ITS PRESENT SIZE.** I should be glad to have you come here and visit my establishment.

**ORDER AT ONCE NOTHING SAVED BY LONG CORRESPONDENCE.**

**LATEST ILLUSTRATED CATALOGUE SENT FREE.** Address or call upon

**DANIEL F. BEATTY, Washington, New Jersey.**

## E. G. RIDEOUT & CO.'S SOLID ALUMINIUM GOLD CASED WATCHES

THE BEST WATCHES IN AMERICA.

THE cases of these Watches are made from a metal discovered in Switzerland, February 15th, 1878, and we are now introducing it for the first time in this country. Aluminium is the only metal discovered that keeps its color and never tarnishes. It costs more than other so-called metals, the foundation of which is brass and grows black after a short time. Our Aluminium cases contain a percentage of pure gold, without which no metal can be made that will keep its color. Life-long experiments have disclosed the fact that a certain percentage of gold used in conjunction with several other metals, will produce a metal equal in appearance and durability to pure gold, though not of the same intrinsic value. The works of these Watches, like the works of all our watches, are of the best make of American Watches. The cases so closely resemble gold, both in density and color, that the most skillful jewelers cannot detect the difference. They retain their brilliancy as long as gold. They are jeweled and well finished, and taken altogether present the same appearance as a Gold watch worth \$200. Previous to September last we invariably charged \$18 to \$20 to citizens coming into our store, and they had abundant opportunities for examining them.

Beautiful and well-finished Chains of the same metal, at \$3, \$4, \$5 and \$6 each. Chains are sold at half-price when ordered with the watches, or by the half dozen. No other house in the world offers watches at so low a price, and we are enabled to do this because we buy the movements direct from the manufacturers, and manufacture our own cases. Moreover, all our Watches are good time-keepers. We send none out but those which have been tested by our workmen for a considerable length of time. No Watch is allowed to leave our establishment, no matter

how pressing the order may be, until it has been thoroughly overhauled, regulated, and made to correspond with the standard time-keeper. Therefore, those who purchase of us have every right to expect a first-class time-keeper for their money; and they may depend upon it that we will make every exertion to meet their anticipation.

We claim the following merits for the Watches sold in our establishment, and for those sent abroad:

1. That they will not vary, if wound up regularly.
2. That the cases will retain the color of gold.
3. That the best jewelers cannot distinguish them from Gold Watches.
4. That the jewels are genuine and not false.
5. That the movement is the genuine American.

In short, we claim for our Watches every merit that is claimed for any Gold Watch costing \$150 or \$200.

**The Movements are all Encased in Aluminium.** Gold Cases of the latest pattern. No jewelry, however high in price, surpasses this in beauty, workmanship, or in any respect, except value. It equals that of gold, which costs nearly ten times as much. The discovery of this compound was characterized by all the leading jewelers as well as ourselves, as being invaluable, for the reason that millions of dollars' worth of gold was annually worked into jewelry and watch cases, thereby taking from circulation that immense amount of money, which keeps the European and American money markets cramped for coin. The importance of the discovery of this compound for gold can be seen at a glance by all educated people, as it will, in every case, answer the purpose of VIRGIN GOLD, except for the coining of money. For that, of course, it will not answer, for the reason that virgin gold is the basis of all

values, and this being a composition, has no standard value, or we could not afford to encase the movements of the Watch with this Gold Metal, and sell the watches complete for that price, as the works are the same as in a genuine gold case.

**TESTIMONIALS.**—We submit the following extracts of letters from parties at a distance, whom we never saw, and of whom we knew nothing except that we dealt with them by mail and express. Those who desire to assure themselves of the genuineness of the testimonials will do well to address the parties. We have too many letters of this sort, from different parts of the country, to resort to the usual method of writing fictitious ones.

ELMIRA, N. Y., January 1st, 1879.  
DEAR SIRS—I have been a conductor on the N.Y. Central R.R. for the past fifteen years. In that time I have had several watches in my possession; some were good, but most of them were wanting in one or more of the qualities of a reliable Watch. I ordered one of your Watches in May, last year. I have run my train by it every day since. I wind it up regularly at 12 M., and it has not varied half a minute during the time it has been in my possession. It retains its original color, and in every respect is the best watch I ever had. You may publish this if it will promote your interests.  
HIRAM FORBES.

JACKSON, Mich., October 20th, 1879.  
I received your six watches all right the day before yesterday, and have sold them all but one. I am perfectly delighted

with them, and all those to whom I have sold them express themselves perfectly satisfied.

EDWARD HUGHES.  
NORA, Mich., August 3d, 1880.  
DEAR SIRS—I sold the Aluminium Gold Watch that I ordered of you some time ago, this day, for \$54.50. Will send for a dozen soon.

Truly yours, F. W. SALSBUURY.

THE LATEST.  
GREAT FALLS, N. H., March 9th, 1881.

GENTLEMEN—The Aluminium Gold Cased Watch which I ordered of you four months since, was received in due time, and I am perfectly satisfied with it. It retains its original color perfectly, and is the best time-keeper I ever owned. Every one supposes that my Watch is solid Gold and cost \$100, or more. With best wishes, I remain, Very truly yours,  
C. E. JEFFREY.

WE HAVE HUNDREDS OF LIKE TESTIMONIALS FROM ALL PARTS OF THE U. S.

**OUR TERMS.**—The price of each watch is \$15, or three for \$30, six for \$50, twelve for \$90. No house in the world offers such watches at such a price. We are enabled to do this because we manufacture our own cases, and the movements are made to our orders.

**HOW TO SEND MONEY.**—Send money by Registered Letter, P. O. Order, or Bank Draft at our risk. If you want watches sent C. O. D., you must remit at least three dollars to five dollars with the order, to insure us against loss of express charges in case you do not pay the C. O. D.

Persons living away from an express office can have their watches sent by Registered Mail by sending full amount with the order, and 25 cents to pay postage and registration. When sent by mail registered, they are as safe as by express.

**READ DECIDE AND ACT.**—In order to get our Aluminium Gold Metal Watches introduced throughout the country, we will make the following offer to all who contemplate taking an agency. We will forward one of our watches as a sample, **WITH A SPLENDID CHAIN** for TEN DOLLARS, which is \$7 less than the retail price, and Seven Dollars less than we ever offered a sample one before. We do this for the reason that we well know if a person buys one we will be sure to send him a half dozen or dozen the next time, as we have never known it to fail.

Please do not confound our ALUMINIUM Gold Case Watch with the cheap metal and utterly worthless watches sold by some dealers.

E. C. RIDEOUT & CO., 12 Barclay St., N. Y.

REMEMBER WE SEND YOU A SAMPLE WATCH AND CHAIN FOR ONLY \$10.00.

CUT THIS OUT—IT WILL NOT APPEAR AGAIN.

PLEASE PUT IN A CONSPICUOUS PLACE.

Depth 24 inches.

Length 46 inches.

Height 75 inches.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer.  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## HOLCOMB'S NEW AMPLIFYING TELEPHONES

FOR PRIVATE LINES.

PATENTED APRIL 26, 1881.

The Only Reliable Substitute for the Costly Electric and Magnetic Telephones.

NO ROYALTY! NO EXORBITANT RENTAL FEE!

SOLD OUTRIGHT AT MODERATE PRICES.

They transmit Conversation, Music, Signals, Commercial Orders, or any audible sound with almost electric speed and surprising fidelity. The tones are clear, natural, and distinct; every word is easily understood.

These Instruments work well in all kinds of weather, and may be relied upon for effective service at all times. They are complete in themselves, and are perfect and durable in every part. Elegantly finished. Warranted to work two miles. Price, \$10 per set net. WIRE.—With these new Telephones we use Galvanized Steel Cable Wire of great strength and conductivity. It does not stretch or break, and makes a very permanent line. PRICES: Double wire for short lines, 3 cents per rod, by express; treble wire for long lines, 5 cents per rod, by express. Metal Insulators, 5 cents each.

**\$4.00 Telephones.**—We also furnish the Improved Automatic Telephones for short lines. They work excellently, and are certainly the best Telephones for the price now made. Price per set \$4.00 net. Wire for these Telephones 3 cents per rod, by express. Insulators, 3 cents each. Illustrated descriptive circulars, testimonials, etc., sent free on application. Correspondence solicited. Terms, cash with order. Address all orders to the Patentees and Proprietors,

### MORSE.

Achilles, thou fierce warrior god, behold!  
A mortal tames that which you but defied,  
His bidding makes its subtle gleams abide,  
And lo! yet far more wondrous still, doth mould  
The thunder voiced tones, that erewhile rolled  
Their terrors 'long the murky storm path wide,  
Into a music language taught to glide  
As true as Mercury's fleet feet of old.

On thy benign and patriarchal brow  
Enwreathed lightnings lambient display  
A flaming crown of prism-like sparkling ray,  
Our great grown craft unto thee rev'rent bow,  
Our patron saint, Oh! Morse, we call thee now,  
And fame is thine, and immortality for aye.

FRANK C. PRESCOTT.

OAKLAND, Cal., June 5, 1881.

### The Ground and its Relation to Telephonic System.

(Concluded from last issue.)

Let none of our telegraph or telephone experts, possessed of "every implement and means of art, and twenty years' apprenticeship to boot," despise the day of small things and conclude that because *they* know all that is written here, and a great deal more beside, time and space are therefore thrown away. The object of this and similar articles is to furnish popular instruction for the thousands of the rank and file of our telephone men of to-day; the men who have to do the work, and who have had no chance for either twenty years' or even twenty months' apprenticeship at electrical work. Many exchange managers, also, and superintendents, have had no previous experience in the line they are now in, and will gladly hail even a small portion of the heaven which it is hoped will by and by leaven the whole lump.

The terminal ground will be first considered.

We have built our line. We are now connecting our bell and telephone, and the lineman, who has come from his last place with powerful recommendations, runs a light copper wire from the last binding screw of the bell to a lacquered bronze gas fixture, twists the wire, bared for three or four inches but not scraped, round the pipe once or twice, and leaves it. The telephone works, as what telephone will not; but it is in spite of the "ground," not in virtue of it. The manager, who has, we suppose, seen fire, wonders why it takes so much battery to work that line. He has all he can do to attend to the complaints of the unfortunate subscribers; but at length finds time to take a trip over the line himself, as he, out of the depth of his sad experience, suspects a bad connection. He passes along from station to station, coming in due course to the end, where after two minutes' scrutiny, he sees the cause of the "rotteness in Denmark." He

remedies it in the following manner: Sending for his lineman, he will have a stout wire run to the nearest *water* pipe. The water pipe, which we will hope for its own sake is iron (lead should never be used), is then filed or scraped clean and bright for at least two inches laterally, and a No. 16 or 18 copper wire scraped bright, and having a length of at least six feet, is carefully and tightly wrapped around the scraped portion of the pipe, each convolution close to the preceding one, until the whole of the brightened surface of the pipe is covered. The wire should be passed under several feet of the last convolutions, so as to pull tight, and enough left at the end, say eight inches, to make a good splice. This end is then spliced to the wire leading from the instrument; and for the first time in the life of our line it enjoys a good earth connection.

If both gas and water pipes are present, connect to both. Water, however, is always to be preferred to gas, for the reason that gas-pipe joints are made up in red and white lead, which act as insulators, and resist the passage of the current. If gas pipe is used, the ground connection must be made between the meter and the street. Water pipes are not open to this objection, because, being filled with water, there is always a pretty good conductor inside of them to pass joints.

Some prefer, instead of the connection just described (which, by the way, our experienced manager carefully solders before leaving), a screw clamp with a binding post for the reception of the wire. This is screwed tightly to the brightened pipe. We do not, however, advocate it, knowing the inveterate propensity of binding screws to work loose.

If our manager can find neither gas nor water pipe, he looks for the pipes attached to a steam-heater, and tries them. Very often they make an excellent ground. Very often again they don't.

But he has now finished the job and returns to the office, his man, if he is the right kind, knowing how to manage in future, and if he is the wrong kind, thinking to himself: What a heap of trouble and work thrown away.

A rather singular case of moral obliquity, which occurred some months ago, may be mentioned here, as showing how the plainest instructions can be readily misunderstood.

A new telephone exchange had been started in a small city, and the expert from an adjoining place had been over, and instructed the new telephonists in the rudiments. Among his other instructions, he said: "If you have to make a ground where there are no pipes, you

must dig till you get to damp ground, and there bury a plate or rod." The line was built but wouldn't work. You could talk over it, but you couldn't ring over it.

An inspector visited the exchange and was appealed to in most pathetic terms to make the line work.

Inquiring concerning the nature of the ground, he was told that the ground wire was certainly perfect, that they had dug a deep hole, and then driven into that a twelve-foot rod, and that they had filled it with water; but still the line would not work. The inspector went, however, to look at the terminal. Taking the ground wire from the binding screw, he found that he could taste the current quite strong. He then went to see the ground, and found that a new way had been discovered. The twelve-foot rod turned out to be a pipe with a water-tight cap screwed on the lower end. They had, as they said, dug a hole and then driven the pipe in, but the ground was dry and rocky. To finish the job, then, they had brought water and carefully filled the water-tight pipe.

Coming now to our central office ground connections, we will uniformly get the best results by attaching the ends of our circuits to a No. 4 or 6 copper wire, carefully cleaned, and soldering every connection. This large copper wire must be connected by as many routes to earth as possible, using invariably as much surface as can be, so as to reduce the resistance of the ground. That is, connecting all our large wires to which the circuits are attached to one still larger, that, in turn, should be branched off; one branch fastened by about six inches of convolution to the water pipe, and soldered; another similarly attached to the gas pipe; another, perhaps, to the steam pipe; another to the building itself, if it be iron, and so on.

In this connection it is, perhaps, well to describe an experiment, which is often tried, but which, by the very nature of things, can never succeed.

It is, briefly, to loop an electro-magnet into the common ground wire, so that at night, or in cases where an operator cannot give the exchange his entire attention, this magnet might act when a call came in on any circuit, should attract its armature, and ring a local bell.

Any practical electrician will at once see that, owing to the infinitely small joint resistance of the combined circuits uniting in the ground wire, no signaling instrument can be expected to work when so placed. To the amateur, however, the idea appears so promising that he

must try it himself before he will be satisfied that it is impracticable.

The foregoing remarks apply equally to the lightning arrester ground wire, which should be made of the largest copper wire that can be procured.

The earth wire at an intermediate station on a telephone line should never be dispensed with. It should be used in connection with a local lightning arrester; and wherever the secrecy switch is used, the same wire may be utilized to work it. It may be constructed in the same general way as the ground at a terminal station, but is not so important, inasmuch as in this case only one individual is concerned, and in a terminal station the entire line is interested.

In the case of a temporary ground wire used to complete the line circuit on one side of a break, no particular care is necessary. Several turns around a brightened gas or water fixture will usually answer very well to work with, until the omnipresent wire fiend repairs the line.

Coming now to the listening ground, it has been found that when two short lines are connected through the central office for conversation, it is not necessary at all times to insert the instruments of the controlling operator into the circuit, but that the necessary work can be done by tapping the said lines with telephones connected to an earth branch. This works well when the lines are both short; but if they are long, or especially if one is short and the other long, the ground branch is found to carry away too much of the current, and the conversation becomes indistinct.

If it is impossible to loop the instruments in such a case, a coil or other high resistance should be inserted in the circuit of the ground branch, as an equalizer; as high as 10,000 ohms will do no harm.

The trouble "ground" needs no comment in this article. A separate article is needed to do it justice.

Only two more remarks seem to be here necessary.

First. When several trunk lines are used for the operation of telephones between two trunk stations, such, for example, as two cities, they should, if possible, each terminate at a different ground; because when they all run to the same ground, conversation transmitted on one wire often leaks past the ground wire and returns on the others, thus causing what is popularly, but in a great measure erroneously, known as "induction."

Second. Never, if possible, ground within a hundred feet of any place where an electric light wire is grounded.

Lastly. We repeat once more that in all cases and at all times too much care cannot be taken, nor too many precautions employed, to make a ground connection perfect. In this matter it is impossible to gild refined gold or paint the lily.

#### Notes and Queries on Electricity and Electro-Magnetism and their applications.

Practical as far as possible;  
Theoretical as far as necessary.

Q. 130. What are the necessary parts of every line of telegraph, or telegraphic circuit?

A. In answering this question we shall be assisted by remembering what is the work required to be done in electrical transmission.

This, we shall see, may be divided into three heads. First. To generate or develop the electricity in sufficient quantity and of the necessary strength to do the work of the circuit. Second. To be able to transmit the electricity to

any required distance without losing any serious amount by the way. Third. To cause it, on its arrival at the distant point, to produce some sensible results; in other words, to record or deliver its messages.

To accomplish these results, then, it is necessary to have in each telegraphic circuit

First. A generator of electricity, which in nearly every case is a galvanic battery, but which may be, and sometimes is, a magneto or dynamo-electric-machine.

Second. A conductor of electricity between the stations, consisting usually of an insulated wire stretching from one terminal station to another, and ending in the ground at each terminal.

For practical purposes, the earth is regarded as a return wire.

When the line is a short one, a return wire is often actually used, and is indeed preferable, as the earth connections frequently interpose a higher resistance than a short return wire.

Third. At each station, apparatus to render the current evident to the senses. That is, instruments wherewith to receive the signals, and to interpret them, and corresponding instruments by which they are transmitted.

These elements, *i.e.*, the battery, the line wire, the transmitting and receiving instruments, at each station, and finally, the earth, compose the telegraphic circuit.

Q. 131. In a Morse telegraphic circuit, how are the batteries usually disposed?

A. It is usual to place half the battery at each end of the line, because, as all lines are more or less liable to defective insulation, such an arrangement tends to give better results on the whole than if the battery power were all at one end. If the battery were so placed, and the insulation at all imperfect, the working current, on account of the leakage, would be much weaker at the distant end than at the battery end.

Q. 132. How may the conducting wires of telegraph lines be classified?

A. They may be divided into three great classes, *viz.*: aerial, subaqueous and subterranean wires. The aerial lines may further be subdivided into those supported on poles and those on house top fixtures; the latter being chiefly employed in our large cities.

Q. 133. Under what three heads may all materials for the construction of the line be classed, the line here and henceforth to be understood as the "conductor," regarded as set apart from the battery and instruments?

A. In the construction of a line of telegraph, all the materials employed may be comprised in one or the other of the following three heads: Poles, or other supports; wires and insulators.

Q. 134. Give some details concerning the choice and setting of poles.

The poles used in this country are chiefly of white or red cedar or chestnut. Red cedar is the best and the most unsightly, though chestnut is the most frequently used, especially in the Atlantic and Middle States.

Poles should in all cases, when cut down, be cleared of all branches, stripped of their bark, shaved smooth, and then stacked for some time in such a manner that the air can freely circulate among them, so that they may be well seasoned.

This is too often neglected, and poles are frequently set as soon as they are cut and trimmed. Very little is done for the preservation of poles used on American lines. The European telegraphs are far ahead of us on such processes. In England, the poles, before being set, are treated with solutions of metallic salts, which, being introduced into the pores of the wood by different processes, combine with the sap and prevent decay.

Poles should not be less than twenty-five feet long, nor less than five inches in diameter at the top. Their length must necessarily depend upon the number of wires they are to carry, but on the majority of trunk routes the length varies from twenty-five to forty-five feet. Except when passing through cities or towns, they are rarely painted; although if such a practice was universal, it would conduce to their longevity.

They should be set at least five feet deep wherever practicable. The hole they are set in should be kept as narrow as possible, and perpendicular at one side, so that the pole will at least have one side of solid earth. When the earth is replaced, it should be well tamped down

after each few shovels are put in the hole, and moderate sized stones may be tamped in, close to the pole.

All the cross-arms required should be attached before the pole is set, in order to save labor. The ordinary practice is to place them all one side of the pole. The spaces cut for their reception on the side of the pole are called the "gains."

In some cases cross-arms are not used and brackets are then employed, which are spiked to the pole, some on one side and some on the other. It is a frequent practice also to bore a hole in the top of the pole and insert a pin which will carry an insulator, so that one wire may be strung on the top of the pole. Whenever this is done, an iron ring, a little smaller than the top of the hole, should be heated red hot and slipped over the end of the pole, after the pin is driven in, to prevent the smaller end from splitting.

The distance between the poles varies with the nature of the ground and must be left to the judgment of the constructor. But the number of poles to the mile will average about thirty; sometimes increasing to forty and sometimes, on a straight and level road, decreasing to twenty. In this connection, it may be well to observe that the fewer supports there are, the better the insulation, as each pole forms a branch circuit (of high resistance, it is true, but still a branch circuit).

In setting poles round a curve they should be made to lean back against the strain of the curve and should also be firmly guyed.

Q. 135. Give information relating to the attachment of cross-arms?

A. Cross-arms should invariably be formed of white pine, well seasoned. They should also always be planed, beveled off, at the upper corners, and well painted. The length, of course, varies with the number of wires to be attached, while the ordinary size is four inches by five.

In regular telegraph work, the cross-arms are longer than in local or city lines. On a trunk line, a cross-arm for two wires is about three feet long; for four wires, five feet six inches, and for six wires, seven feet six inches; while the distance between the insulators from centre to centre is generally about twenty-two inches.

No such magnitudes are used on short private telegraph or telephone lines, the cross-arms being much shorter in proportion, and the insulators placed much nearer together. The cross-arms are fastened to the poles with either a pair of stout spikes or with bolts and nuts. The latter is preferable. All cross-arms should be fitted with the pins and insulators before the pole is set up.

T. D. L.

#### Possibilities; or, the Future of Electricity.

While we are waiting to see or hear of new developments in electrical science, would it not be well for us to study what the future should or will be, and thus open a field for the genius to work on?

Each day brings to our minds something that would benefit or improve this and that. These thoughts carefully preserved would, in a short time, develop others, and so on, until one discovery after another, "probably scarcely dreamed of now," would be made.

The operator while on duty has occasion daily to notice room for improvement here and there. How few of them think that an occasional thought in this direction might be of great benefit toward the advancement of this particular branch of science.

Would it not be better for every one of us to make more of a study of electricity than to be capable of merely handling it mechanically?

The different journals of telegraphy bring to us reports of the discovery of this and that. Who are these inventors? They are those already noted in this and other countries for the many improvements their inventive genius have wrought. Rarely do we hear of a really useful invention from an apparently unknown in the telegraph profession.

A few minutes' thought each day as to what would improve or be of great service, would soon bring many ideas to the mind. These carefully noted and experimented on, might prove to be

of great value. If our unoccupied time was used in this way, and the results published in THE OPERATOR, it would certainly be interesting to many of its readers.

The field for improvement and uses of electricity is endless. Only a few years ago the thought of talking so that the human voice could be heard and even recognized several hundred miles away, seemed very foolish and impossible. Now we say there is nothing impossible. Let us read carefully the following and see what can be added to the future of electricity:

We will not only hear by telegraph, but we will see as well.

We will be able to see and hear the proceedings in Congress and the various Capitols, also in theatres and other places of amusement; even base ball games will be witnessed by thousands many miles away.

Machine shops and other manufacturing establishments, railroad trains, steamboats, etc., will be run, heated and lighted by electricity.

We will have telegraph offices on railroad trains and steamboats for the accommodation of the traveling public.

Conductors of trains will be able to talk with and receive orders from their head officers while running at the rate of one hundred miles per hour.

We will be able to take pictures by telegraph.

We will telegraph and talk a great distance without wires.

We will be able to talk from house to house—all included in our rents.

We will see electricity take the place of steam, wood and coal.

We will be able to talk with foreign countries, even to the North Pole.

We will do away with telegraph and telephone lines entirely.

Which shall we have first?

L.

#### Aphorisms for Telephone Exchange Managers.

Answer calls promptly.

Answer calls quietly.

Ring up subscribers not more than three times. If they do not answer then, tell your inquiring subscriber that Snooks does not answer. When your subscribers realize this, they also will become accustomed to respond as promptly as they expect you to.

When your subscribers are connected, cut your own remarks short. Don't attempt to boss the job.

When you think your patients have got through, listen before you speak. If you have got among your operators a "hello fiend," caution him or her three times; then if he or she persists in thus flying in the face of Providence, let him or her be eliminated. Your subscribers will appreciate it.

Keep a close watch for zealous operators who cut off too promptly. There are those who conceive that "cutting off" is their whole duty, and that making connections is merely a subsidiary or preparatory operation—a sort of electrical side-show.

Don't allow your operators to receive and talk away complaints. If an aggrieved subscriber has anything to say, let him say it to you. Instruct your operators accordingly.

When you receive a complaint, attend to it then and there. A stitch in time saves nine, and a prompt action will often both save you a subscriber and make you a friend.

When a subscriber abuses you in unmeasured terms for something you can't help, however great the temptation, don't jaw back. Remember, he is a portion of the income of yourself or your employer. Under the circumstances, a still tongue shows a wise head.

If you accidentally find out that the apparatus of any subscriber is out of order, no matter how small the trouble, have it fixed right off, though

you have to do it yourself. Don't wait for a complaint.

Test your wires every morning, by calling up the last subscriber on each wire and talking to him. If you find trouble, send your lineman to remove it at once.

Don't lose your head in the press of business, nor allow your operators to lose theirs.

#### The Telegraph Suits.

On the 1st inst., in the Superior Court, before Judge Truax, a final disposition was made of the case of William S. Williams against the Western Union Telegraph and Union Trust companies. It had previously been agreed between the counsel that upon the return of Mr. William H. Vanderbilt from Europe he should be examined as a witness for the plaintiff, and on that day Mr. Vanderbilt appeared. His testimony merely corroborated that already given by Mr. Gould and others. This concluded the case, but no decision has yet been rendered.

During the progress of this suit Mr. Williams procured a Chamber order commanding those companies to exhibit to him their books, which order the Special Term vacated and annulled. From this decision Williams appealed to the General Term of the Supreme Court, which on the 6th inst. refused to compel an examination of the books, with costs against Mr. Williams.

In the Hatch case Judge Truax, on the 6th inst., ordered the summing up to begin, and after that he took the papers and briefs. It is understood that he will decide the Williams and Hatch cases at the same time.

Meanwhile, as rumor says, Mr. Gould has obtained in New Jersey a charter for a telegraph company, and, if the decision in the pending litigation is unfavorable to him, he will buy or lease for his new company all the property and franchises of the Western Union, American Union and Atlantic & Pacific. In this new deal the old Western Union will receive 148½ of the new stock for 100. In this way the legal embarrassments that are now being thrown in the way of his consolidation will be avoided, and Western Union stockholders will get their scrip dividend of 48½ despite Mr. Williams and Rufus Hatch.

The motion of the French Cable Company for and injunction against the Western Union Telegraph Company, restraining it from interfering with the contract of the plaintiffs with the American Union Telegraph Company, was reopened on the 3d inst. on the reamended bill of complaint before Judge Blatchford, in the United States Circuit Court. The argument was continued next day by Gen. Swayne, who held that the only relief possible for the plaintiff was in the shape of damages or relief in equity. The business of the plaintiff had not suffered by the consolidation, for the cable messages that had been sent by the plaintiff company were as many in number now and as valuable as formerly. He said there was no ground for enjoining cables not yet laid. Senator Edmunds made the closing argument for the cable company, contending that while the American Union could transfer its property, it could not dispose of its obligations to the plaintiff, and therefore it had no right to close any of its offices. Judge Blatchford took the papers and reserved his decision.

#### Telegraphers' Criminal Forgetfulness.

At Bear Swamp Switch, near Trenton, N. J., on the 30th ult., a train on the Pennsylvania Railroad, going at the rate of 45 miles an hour, was switched on to a side track where a freight train was standing. Two people were killed and several injured. John R. Sutphin, the operator, who appears to have been out in the woods gathering magnolias at the time, ran away when he heard of the frightful consequences of his negligence. The coroner's jury found that the accident was due principally to Sutphin's carelessness, and also, very properly, censured the

parsimonious management of the Pennsylvania Railroad for not supplying sufficient and competent force, it being well understood that while that company pays its operators less than is paid to common firemen in the navy there can be no security of life or limb. The verdict might also have censured Superintendent James McCrea and Chief Ettinger, of the New York division, since it was proved on the trial that Sutphin had been twice discharged before this—once for giving false train reports, and again for leaving a switch open at Morrisville. If the executive officers of the Pennsylvania road dictate this cheap labor policy, they might as well hire Chinamen at once, and not be content with unstable and irresponsible cast-offs, simply because they can hire them at so much a dozen.

Less than a week after this butchery, another railroad slew two more human beings, and mangled a number of others. On the 5th inst two freight trains came into collision on the Chicago & Northwestern Railroad, four miles from Cedar Rapids, Iowa. Both trains were reduced to kindling wood; two men were killed outright, and several others were scalded and had limbs broken. The culprit in this case was Charles B. Lewis, the night operator at Cedar Rapids, who forgot to deliver a train order.

#### Mutual Union Notes.

The directors of the Mutual Union Telegraph Company, of which John O. Evans is President, have resolved to increase the capital stock to \$10,000,000, and to extend their lines to most of the great cities in the North and West. The company's wires now extend from Boston to Washington, touching New York, Philadelphia and intermediate cities. The present capital consists of the money invested in those existing lines. With the increase of capital now resolved on, the company proposes to extend its wires to Albany, Rochester, Buffalo, Cleveland, Toledo, Chicago, Milwaukee, St. Paul, Minneapolis, Kansas City, St. Louis, Indianapolis, Cincinnati, Columbus, Pittsburgh and Louisville, and other cities in the circuit embracing those centres. The managers of the scheme claim that the extensions they are to make will cover about nine-tenths of the paying district or territory covered by the wires of the Western Union Company. President Evans is a thorough business man, and has secured some of the best available talent in the business.

The Washington correspondent of the Baltimore *American* telegraphs to his paper as follows:

"The much-debated question whether telegraph wires can be buried and successfully operated will be tested by the Mutual Union Telegraph Company in this city within a few days. Failing to secure the necessary pole privileges on certain streets, the company made application to the District Commissioners for the right to lay a six-wire Mayall cable through the city sewers. The commissioners granted the privilege, and yesterday the company commenced the work of laying the cables. The first section, which will be an experiment, will be about 1,700 feet long, and will connect at the corner of Twelfth street and New York avenue with the main office. If the experiment proves a success the company will proceed to lay a similar cable to the Capitol, a distance of one mile, and to such other points in the city as their wants require. The company will open Monday with six wires to Baltimore, Philadelphia, New York and Boston. Already two of their wires have been leased by private parties between this city and New York. A large number of men will start early next week to put up wires over the National pike, through Cumberland, Md., Pittsburg, Pa., Wheeling, W. Va., and Columbus, O., to Cincinnati."

The Chicago *Inter-Ocean* says: "Mr. John O. Evans, President of the Mutual Union Telegraph Company, who has been in Chicago some days, looking after its interests, yesterday made arrangements with Col. J. J. S. Wilson, late

Superintendent of the Western Union lines, to take service in the Mutual Union. Colonel Wilson will doubtless prove a valuable acquisition to the new company." Colonel Wilson, while quite a lad, accepted, in 1850, the position of superintendent with the Hotchkiss line between Chicago and Madison, Wis., and in 1851 took charge of the office at Springfield, Ill. In a few months after assuming the management at Springfield, Colonel Wilson exhibited such executive ability that he was appointed superintendent of the western division of the Illinois and Mississippi Company's lines, the duties of which he performed with marked success and ability for eighteen years. When the government took military possession of the telegraph lines of the country, Mr. Wilson spent much time in the field, where he gave well directed and efficient aid to the army officers. This led to his being commissioned by Governor Yates, Sept. 10, 1861, Colonel of Volunteers, and to his reception of a warm and emphatic letter of thanks from General Grant. Colonel Wilson entered the service of the Western Union Telegraph Company in 1866, and was assigned by General Stager to the superintendency of the Central Division of the lines of that company, with his headquarters at Chicago. This district embraces 10,000 miles of telegraph route, and one thousand offices. A warm, personal friend of General Eckert's, the preceptor of Colonel Clowry, a thorough telegraph man, the soul of honor and a popular favorite with the public and employes, Colonel Wilson was nevertheless sacrificed when the consolidation came, but his lines have fallen in pleasant places, and he will find a worthy chief in the person of John O. Evans.

#### More Welcome Opposition.

The organization known as the Bankers' and Merchants' Telegraph Company has commenced active operations, the first route to be opened being that between New York and Philadelphia. A contract for the erection of this line, with at least twelve wires, has already been entered into and the work has been placed under the supervision of W. B. Gill, the late superintendent of the Sixth Western Union division. The erection of this line will be begun at once; it has been selected because, on account of the number of existing wires and the narrow limits within which the line can be profitably built, it presents more difficulty than one over any other section of country. At the same time it commands a highly important business and one in which the stockholders are specially interested, since almost all the shares are held by New York and Philadelphia business men.

The company has been incorporated in New York, New Jersey and Pennsylvania, and is intended, as its name implies, for business and commercial purposes only. Its offices will be in the business parts of the cities which it will connect, and it will not seek social or miscellaneous business. The stock has all been taken by bankers, brokers and merchants in New York, Boston and Philadelphia. The officers of the company are as follows: President, W. W. Mavis, of Mavis & Smith, bankers, Philadelphia; Vice-President, A. W. Dimock, of A. W. Dimock & Co., bankers, New York; Treasurer, J. H. Crossman, of F. M. Lockwood & Co., bankers, New York; General Superintendent, G. S. Mott, late Superintendent of the Atlantic & Pacific Telegraph Company; Secretary, Gere G. Case, late of the Continental Telegraph Company. The capital is \$1,000,000.

The International Telegraph Company filed articles of association at Albany, N. Y., June 4. The capital will be \$10,000,000. The route of the line is to go from New York, by way of Philadelphia, Baltimore and Washington, through the States of Virginia, North Carolina, South Carolina, Georgia, Alabama, Florida, Mississippi, Louisiana and Texas to the Rio Grande River; also from New York by way of Albany and Rochester, to Buffalo; also from New York, by way of New York, Lake Erie & Western Railroad, to Buffalo, and thence west through Pennsylvania, Ohio, Michigan, Illinois and Indiana to Chicago; also from Philadelphia to Cincinnati and St. Louis; also from Cincinnati, through Mississippi, Arkansas and Texas, to Houston and Galveston; also from St. Louis, through Missouri, Kansas, Colorado and New Mexico, to Mexico;

also from Chicago west to California; also from New York to Portland, Me.; also from Boston to Montreal and Quebec. The shares are taken as follows: Andrew J. Baldwin, of Wilkesbarre, 50,000 shares; James F. Cox, of Morristown, 25,000, and Charles H. Stebbens, 25,000. The concern is to continue 100 years.

The International Company will work exclusively with the Delany patent, the invention of Mr. P. B. Delany. It is the intention of this company to begin the construction of its lines at Washington, and extend them southward via Richmond and Savannah to Mobile during the summer.

#### Answers to Correspondents.

OSBORNE: Q. 1. Is it necessary or not to have a switch to cut out instruments during lightning?

A. It is. An ordinary button switch will do. One wire can be connected to the incoming wire, the other to the wire leading out; or any ordinary telegraph cut out will answer.

Q. 2. If no switch is used, is there not danger of the buildings being fired by the lightning running in on the wires?

A. There is very little; in fact, not so much as if lightning should strike a house where no wires were attached. The most damage would generally be the destruction of the magnet wire. The wires would probably lead the electricity of the lightning out if the circuit were grounded. If a return wire is used, it would probably not be touched by the lightning.

Q. 3. Will one Leclanché cell ring a vibrator bell on a line 300 yards long, using a return wire?

A. No. To ring a vibrator properly, it will take at least four cells, and if only one bell is in circuit at once, that bell should have a resistance of 10 ohms. If two at once, they should be 5 ohms each.

Q. 4. Is there any kind of a call-bell made that does not require a battery?

A. Yes. The magneto bell is generally used on telephone lines. Its current is generated by the movement of coils of wire near magnets. A magneto bell can be bought from almost any good manufacturer of telegraph instruments.

F. E. A., CANADA.—Our paragraph relating to the scarcity of good operators applied exclusively to strictly first-class men. 1. A "good" operator can hardly be gauged by the number of words he sends and receives. On a pure question of manipulation a man who could send and receive 30 words a minute—that is, 1,800 words an hour—might be called "good." A man who could sit in at any time and always calculate upon disposing of from 2,000 to 2,400 words an hour, send or receive, in good style, might be classed as strictly first-class. Your copy would not pass muster in that class. But a "good" operator—that is, a valuable one to the company—must combine many qualities. An ability to read bad copy without stumbling, to be always on time and diligent, good manners on the wire, some brilliant flashes of silence, and the faculty of turning over the office cash intact at the end of the month are all elements entering into the character of a "good" operator. The honest, plodding gentleman with the record of a 20-word gait is less of a "plug," as far as his employer's interests are concerned, than the *blazé* rusher who gets away with the office cash at the first opportunity. The telegraph needs thorough men, not specialists. 2. The salary paid to such an ideal good operator would range all the way from \$30 to \$90 per month, according to location. For a man who met all the above requirements and maintained that standard, the latter salary would be assured to him in the end; but in the meantime, if he went to bricklaying and exercised similar qualities, he would become a wealthy contractor. 3. We would not advise you to try the States at present. 4. There is no scarcity of operators here, except of an exceptional class, of which there will always be a scarcity. 5. The list would be too long to print, but you can address the manager of any Western Union office, inclosing stamp for reply.

FOUR DOTS.—Twenty words per minute is slow working. The average, all in all, is probably 25 words; of the faster wires, 35 words. See the foregoing reply.

#### A Definition of Radiant Ener-Jay.

First, solidity was secured to the substance to be planted by the "post"-roads being made highways, and thus the molecules were made adhesive.

Extremely so!

The heat, however, increased so rapidly at certain points that the form of the structure began to assume the lick-uid, and then the molecules began to jostle and bang each other in a most excitable way.

Remarkably so!

Still later, the gas house, a very "promising" edifice, was erected, and volumes of that commodity were showered upon the molecular formation of the public's anatomy, which by its impact on their cohesiveness toward a separation from the control of the power that had imprisoned them in its unrelenting grasp, produced numerous collisions of the particles, in their struggle for freedom and supremacy.

Wonderfully so!

The most pugnacious atoms, at this stage, having assimilated to themselves all the weaker and less antagonistic ones, and having driven out those not easy or willing to be so absorbed; also having a clear track, their movements are less hampered and motion takes on a new phase, so that we are left on the wonders of border-land as to the ultimate path to be pursued, or the decision of the "course."

Very truly so!

#### New Books.

"Electro-Telegraphy." By Frederick S. Beechey, Telegraph Engineer. New York: E. & F. N. Spon, 446 Broome street.

This little book is the second edition of a work originally published in 1876, and from the succinctness and clearness with which it is written, not less than from its brevity and the extreme moderation of its price, it merits almost unqualified praise.

Its title, "Electro-Telegraphy," we are inclined to think, may be justly criticised. Two chapters are devoted to the nature and sources of electricity and three to batteries. Practical telegraphy, including various systems and several varieties of instruments, is then briefly described, and special arrangements, as also testing and measurements, are briefly treated.

Very little can be said of the illustrations; but they help the text, and the chief wonder about the work is how so much can be compressed into so small space.

The price of the paper edition, which contains 126 pages, is 20 cents, which brings the book within the reach of all.

In several large cities—Philadelphia, for instance—the late American Union Company received valuable privileges on the express condition that it would never merge with any other telegraph company. It filed bonds as security for its good faith, and agreed that those privileges should be forfeited if it ever consolidated with any like concern. The officers of those cities hesitate to ask for judgment on those bonds, alleging that they can procure no proof of a consolidation, notwithstanding that a verified copy of the testimony of Jay Gould and others in the William's suit is to be easily had; but, if we may judge by the signs of the times, there is a growing anti-monopoly feeling in the community which may remind them of their neglected duties about the time when their tenure of office expires.

## Chicago Notes.

To the Editor of The Operator:

SIR: Since our last communication quite a number of changes have taken place in our ranks. Men who have been in this office for the past fifteen years, and have almost become gray in the company's service, are quitting the ranks of a profession they so brightly adorned to engage in other occupations elsewhere. While we are sorry to see them leave us, we hope what will undoubtedly be our loss will be their gain. The following resignations have been handed in:

Wm. McMillan, for the past seventeen years check boy and then manager of the check department, leaves us on the First, and goes to New York to engage in other business.

Mr. Parker, Col. J. J. S. Wilson's private secretary, has resigned.

Charlie Mixer, assistant chief, gone to Washington.

F. Minor, gone to St. Paul.

A. G. Drake, ditto, accepts position on M., P. & St. L. R.R.

J. D. Walker resigned position as reporting operator for *Inter-Ocean* private Washington wire and accepted position with one of the produce exchanges.

Sam. Wallace, of the A. U., succeeds Mr. Walker.

Arrivals: Jeff. Prentice, Mr. and Mrs. Frame, H. J. Herbell, from St. Louis; Wm. Sanderson, Rock Island, Ill.; Messrs. Swift and Sherwood, Kansas City; and a number of others whose names we have not been able to ascertain.

Al. Baker has gone to Michigan for a few weeks' vacation.

L. L. Lathrop was summoned home to New York State suddenly on account of his mother's serious illness.

Visitors: Tom Winters, well known in Canadian circles, from Phillip, Minn., and John Mason, a well-known operator, at one time employed in Ch. office, but now superintendent of some railroad in Missouri, were among the visitors here this month.

A thief got into our coat-room the other night and stole three valuable overcoats belonging to Will Kane, George Hoyt and J. J. Burke. The insecurity of the coat-room has been the subject of comment here for years past. A waiter at the lunch counter was suspected and arrested. The ladies also complain that there is a sneak-thief that pays a periodical visit to their lunch and dressing-room.

Our barber has been cleared out; the men no longer enjoy the privilege of getting shaved upon the company's time. "Corkey," the bootblack, got notice to quit; the lunch-room proprietor likewise. Our lunch-room is to be thoroughly renovated and conducted on the dairy principle hereafter. This is a reform in the right direction, for the lunch-room was the filthiest place in the city. While Superintendent Tubbs is instituting these reforms, will he kindly look into the paying system, and see if it cannot be put upon a more satisfactory basis. Night men complain that they are kept waiting from four to six hours on the first of every month for their salaries.

An operator from Orilla, Ont., applying for a situation incloses a tintype of himself with "73" scratched in the corner. Canada "takes the cake." W. C. Long's second eldest boy died from diphtheria. He has our deepest sympathy.

On May 28th the following official order was issued: "Hereafter no extra pay will be allowed for Sunday work. The day force will take it in turns." First move on the board, what will be the next? We would like to know whether this order has Gen. Eckert's approval, or if it is merely a local manifesto. The universal opinion in this office is, to put it mildly, that it is unjust in the extreme. We work as it is ten hours a day, with half an hour for lunch. In other large offices where the men are compelled to take their turn Sundays without receiving extra pay for their services they get off at half past five. In any other branch of business outside of telegraphy if a man is forced to work Sundays he is paid twice as much for it as for regular day's work.

Pleased to see New York has made the first move toward organizing a society for the protection of our interests. The country is ripe now for such an organization. There seems to be a feeling of uncertainty and mistrust between employer and employé. How can it be otherwise? Let those

in high places who profess to have the welfare of the telegraphic community at heart, not disregard the murmurings of the multitude. There's a limit to everything; all we ask is to be treated like men, with a smattering of justice and equity.

## Toledo (Ohio) Notes.

To the Editor of The Operator:

SIR: Since our last communication the American Union main office has been closed, and the American Union and Board of Trade Telegraph offices in the Produce Exchange building have been merged into one. The new office is complete in every respect, having direct wires to New York, Buffalo, Detroit, Cleveland, Pittsburgh, Cincinnati, Louisville, Chicago, St. Louis, Kansas City, Omaha and other important points. Excellent service is the order of the day, and an immense amount of business is handled by the twelve to fifteen operators employed. A. H. Thorpe officiates as cashier, W. W. Umsted, chief operator, and C. D. Meserve as manager of the gold and stock department.

At the Western Union main office some changes have taken place—Mr. Herr having resigned to accept a position in the Chicago main office. Messrs. Hosley, Campbell and Springer, formerly of the A. U. force, are now employed in this office. P. W. McGill, of the A. U., has gone to Chicago, also Mr. Kennedy. Charles Ganson is on the day force in Detroit. T. J. Stevens, formerly manager of the A. U. office "on change," has resigned to accept a position with Reynolds Bros., a leading commission house of this city. Tom will be missed from the ranks. It is amusing to hear him use the term "we grain men."

Messrs. Pearce, Stevens, Springer, Robertson and Hasley boarded a train at the Union depot and took a trip to Detroit on Sunday last. They were greatly surprised on alighting from the train at being met by a delegation of twenty operators from "De" office. A general hand-shaking followed, when the boys were conducted to dinner at that excellent hotel, the Standish House. After dinner sight-seeing was indulged in, the Detroit delegation doing the handsome thing on every hand. Prominent among those who labored hard to make everything pleasant for the Toledo gentlemen we may mention Messrs. James Houlehan, Norm. Webster, Andy Beaubier, Harry Becker, Jack Morrison, Bob Risdon, Messrs. Scott, Dillon, Colby and others. The day was a very enjoyable one, and Toledo wants a chance to return the compliment if she can.

Bert Pearce is now generally known as Mr. Six-ears, an operator at a way office on the Lake Shore road having requested Jim Wright to give his "73 to Mr. 6-ears" a few evenings since.

HAWKSHAW.

## Mississippi and Louisiana Notes.

To the Editor of The Operator:

SIR: The force at Vicksburg consists at present of W. E. Flippen, manager; C. W. Montgomery, F. R. Steele and H. B. Geer, operators. Our daily papers both subscriber to the Associated Press, and the Cotton Exchange takes the C. N. Ds. Business during fall, winter and spring is generally good, but during the summer months falls off considerably, hence our force was reduced on May 1.

Mr. Gus Luckett is day operator in the general manager's office of the V. & M. R.R., and Mr. H. Hand stands the lonely watch. Mr. I. Hardy, an old-timer, is employed in the general superintendent's office of same road.

At Greenville, Miss., Mr. A. E. Dennett and an assistant look after the interests of the G. & V. Telegraph Co. Mr. William Hunter is operator at Mayersville, and Mr. R. Spann at Ben Lomond, on same line. Old "father Downey" runs the Chotard office, and keeps up the line on his section. While out repairing during the recent high water, he slept one night on a log in several feet of water. He said he was glad of the water, as it kept the bears and panthers away. At Delta, La., on the V., S. & P. R.R., Mr. Eugene Windes is operator, and at Monroe, on same road, Mr. J. Morrison has charge of the W. U. office. At Shreveport, La., Mr. W. S. Taylor is manager, assisted by Mr. A. W. Moran, who formerly worked in this office. Jackson, Miss., is repre-

sented by Mr. A. Julianne, assisted by Mr. Cross. The latter is at present away on leave of absence, Mr. W. Harvey subbing for him. Mr. A. Wark, an old-stager, is manager of the W. U. office at Natchez, Miss., and Mr. Burke is his assistant. Mr. Wark is known as the "wooden man," owing to the fact that he never breaks on press. Mr. McMurchy has managed the Fayette (Miss.) office for upwards of twenty years, and bids fair to do so for twenty years more.

CARPET BAGGER.

VICKSBURG, Miss., June 6, 1881.

## Cincinnati Items.

To the Editor of The Operator:

SIR: I. N. Miller of the American Union has been appointed Superintendent of the Western Union, vice Geo. T. Williams, resigned. Mr. Williams has been connected with the Western Union, in this city for the past sixteen years, and has been noted for his clear executive business qualifications. The new Superintendent, previous to his identification with the American Union, was for many years Superintendent for the M. & C. R. R., and is considered to be one of the finest electricians in the Western country.

Mr. Edward Le Loup, formerly Superintendent of the American Union for the Southern Division, with headquarters at New Orleans, arrived in the city yesterday morning and reported to Superintendent Miller. He will assume the management Monday. In appearance Mr. Le Loup is not unlike Signor Tagliapietra, the famous tenor singer, and is full of energy and worthy of the responsible place to which he has been assigned. He was one of General Eckert's most thoroughly tried lieutenants in both of the great telegraph fights. There was a unanimous feeling, and a strong sentiment expressed in favor of C. E. Page, the present manager of the American Union, for the managership, on the principle that "to the victors belong the spoils;" but as the company has need of his service elsewhere, we do not know of a more fitting selection for Cincinnati than Mr. Le Loup. The retiring manager, F. A. Armstrong, has been in the service continuously ever since he was a boy, some thirty years, commencing as messenger. He is a very courteous gentleman in all his business and personal relations, and is a man of decided executive ability.

While I am writing (Sunday afternoon) there is one half of the working forces of the W. U. and A. U. offices assembled in a room of the Galt House, this city, holding an initiatory meeting for the purpose of organizing a protective union. There is no secrecy about the meeting, and I can conscientiously predict that in less time than one month it will have the entire office enrolled.

\*\*\*

## Reading (Pa.) Items.

To the Editor of The Operator:

SIR: The P. R. & P. and W. U. office is in a flourishing condition, and is very ably managed by Mr. Fred. H. Gartlan, with the following efficient corps of operators: W. H. Runyon and Wm. L. Gehr, days, and Wm. H. Hamaker, night chief and pressman. Mr. E. C. Runyon acts in the capacity of clerk. The American Union still does its share. Business has increased rapidly since the consolidation, and no doubt the A. U. will ere long have charge of all the W. U. wires in this city under the new management. Jno. M. Bertolet is manager of the American Union; his assistant, Mr. Samuel F. Higo, is the smallest operator in this section, measuring about 4 ft. 6 in. and weighing about 65 lbs. He is, however, a good operator. The P. & R. Depot office is presided over by F. N. Boyer as manager, with Joe Barrett, C. M. Dechant, Wm. Achenbach and Mr. W. Light as operators. Mr. O. W. Stager is still Superintendent of the P. R. & P. Co., with E. R. Adams as Assistant. Mr. Adams is a first-class operator, and is highly esteemed by all the telegraph manipulators.

The Telephone Exchange is ably managed by Jno. Fleck; vice Jno. Smith resigned to accept a situation as clerk with the Scott foundry. Mr. H. W. Spang, general manager of the Eastern Pennsylvania Telephone Company, left last night for Cincinnati, O., on business. JACK.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, JUNE 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the *old* as well as the new address.

## A FEW TIMELY SUGGESTIONS.

There can be no mistaking the rumbling sounds, East and West, which, after a fair trial of three months, greet the tendency of the new telegraphic management to increase the number of working hours, to decrease the stipend and to ignore altogether the rules of civil service. Fifty-four hours are in all conscience a fair week's work, yet in some places—Chicago, for instance—the fifty-seven hours already exacted are being supplemented by the imposition of unrequited Sunday work. In other places the management is working havoc with our hoped-for rule that, other things being equal, promotion must be from the rank next subordinate. Men scarcely a year from the operating table have, after a brief service in the American Union fizzle, been returned to their old offices and intrusted with positions of which they had never dreamt. In these cases, at least, it should not be too much to expect that if these young men are to be thus elevated they be transferred to other stations, since the suddenly altered position leaves the way open for disorganizing elements—too much familiarity, or possible spite or resentment in paying off old scores, when a man is within a year taken from the ranks and placed in a position of great authority over his old associates. But the salary reductions are more noticeable than all, though we entertain grave doubts regarding the expediency of many of the schemes proposed as checks to this peculiar system.

To the great number of friends who have been good enough to write us at length on the subject we have a word of warning; and, since true loyalty to a friend should rather reprove than flatter, and believing that next to knowing how to conquer honorably is knowing how to yield gracefully, we have no hesitation in setting forth some important points for mature consideration. Some men are not gifted with practical minds, and are therefore unable to appreciate or to make allowance for the many difficulties which present themselves in the government of a great enterprise. Reforms need time, great patience on the part of all concerned, and gradually liberal methods. All good things cannot be obtained in a day. If those who are now temporarily snowed over have apparent grievances, there may be found upon investigation some valid reason for burying them so far out of sight. And even if, as it certainly does appear, the new managers are screwing the vise a little too tight, they must very soon see that, although the changes are acquiesced in with all due devotional sadness, it behooves them to resurrect the forgotten rule which enjoins us not to ride a willing

horse to death. Moreover, grown men with wives and children, and dependent mothers, can not afford to fight any shadows or windmills, and we must be well assured that the dissatisfaction is really widespread and well founded before making any remonstrance.

But, above all, we should take counsel of only those of our friends and co-laborers who remain unswayed by the ebb and flow of personal prejudice, and who are not easily bewildered by unexpected emergencies. Having resolved to do unto others as we would be done by, we should select spokesmen who, by continual reflection, analysis and synthesis, have thoroughly mastered both sides of the question. It will not be enough that these trusted men are ordinarily intelligent and fair-minded—they must be extraordinarily so, ripe in sober manhood and fully impressed with their grave responsibilities. With such a board to represent us, if it be met with the spirit of fair play from the other side, all controversies could be promptly settled. No employer who sought to act fairly towards us would have anything to fear, for we would oppress no one. We would have no fear of being ourselves oppressed, since in our unanimity, coolness and discipline, with a just complaint, we could feel assured that it was beyond the power of others to oppress us.

THE sudden and premature demise of our esteemed contemporary of Boston, the *Telegram*, is privately announced, after the issue of only two numbers. It was a handsome 16-page journal, in paper covers, well illustrated and very creditably edited. We had a kindly feeling, and plumply said so, for any competing journal which would show enough enterprise and ability to keep *THE OPERATOR* well up to the standard of perfection, and for that reason principally we regret that our late contemporary fell by the wayside. We extended it a kindly greeting—the mavis never piped its love song to the morn sweeter than we would have sung its lullaby song. Our naturalists tell of the elephants traveling in India—how the old ones swim the running streams first, and then watch tenderly and anxiously the frantic efforts of the junior members of the herd to cross over, being meanwhile ready to plunge in to their aid. So were we, who crossed the stream some time ago, watching in a fatherly way the struggles of this baby venture; but, without a word of warning, it has disappeared beneath the waters where so many of its kind have been swamped and sends us its own obituary written on a postal card. The second and last number of the *Telegram*, although a trifle behind time, bore evidence of apparent prosperity and of being on a sound financial basis, so that this sudden post-mortem announcement of collapse leads to the inevitable reflection that, as Josh Billings would say, "It would have been money in the *Telegram's* pocket if it had never been born." Conducted, as it announced in its first number, in favor of our telegraphic system being transferred to Governmental control, it found, probably, less support on that account, as such a scheme is now decidedly unpopular in this country. In its Salutory the *Telegram* pithily said: "In telegraphic publications, as in all other trades, the people, sooner or later, learn who serve them best, and in the survival of the fittest the *Telegram* hopes to have a long and prosperous career." *THE OPERATOR* subscribed heartily to that doctrine from the very first, and, under the "survival of the fittest" rule, sincerely mourns the untimely taking off of its lively and adolescent contemporary.

THE appearance in our local columns to-day of the record of two fatal railway accidents in widely separated parts of the country, and both ascribed to the carelessness of telegraph operators, is a striking commentary on the prevailing "economical" system of employing cheap and incompetent men. If the spirit of compassion which is found in the heart of every true man does not animate that of the ordinary telegraph executive officer, his duty to the public and his own employers demands that he should at once assume such a virtue. Your cheap man looks well (for the shoddy superintendent) on the payroll, but he is generally a person without ability, and always without any sense of responsibility; and thus he is for the sake of false economy permitted to plug away day after day at important business which, if not considered of great consequence to the company which he serves, involves perhaps thousands of dollars, and oftentimes the lives and limbs of its patrons. The newly organized opposition companies may glean a wholesome lesson from this. The public will not patronize a telegraph or railroad company simply because it is opposing a great monopoly, or from any other emotional or sentimental reason. The public demands that the company which transmits its business, shall employ the most skilled and intelligent workman and the best apparatus. In fact, the public wants good work—and good men are not in the habit of yielding gratuitous services—and the only way in which a greatly needed opposition can secure patronage is to serve the public better than the Monopoly serves them. To do this they must employ competent labor, and to obtain the latter they must pay fair salaries. No good salaries, no good work; no good work, and the public will travel and send its messages by other lines.

THERE can be no better evidence of the influence of *THE OPERATOR* than the wide comment which is evoked by some of its articles, and on no subject has this been more marked than that of its advocacy of an open, fearless and recognized organization of telegraphers. Replies and suggestions, which have been uniformly favorable to the scheme, are found to be in some cases impracticable or absurdly sanguine. We desire that our friends, in discussing this important subject, should be guided by past experience, which has taught us the absolute necessity of restraining undue enthusiasm and of the exercise of prudent caution in utterance. A great body of intellectual men, by consolidating, form a tremendous engine for good or evil, so that, to avoid tyranny on our side equally as effectively as we would combat oppression on the other side, we should look as diligently to the eradication of pernicious elements among ourselves as we should to the reform of crying evils among others. In fostering a spirit of self-control, then, we may find it necessary to tone down the eager enthusiasm of disappointed or unthinking counsellors, the violent passions of the spiteful and unjust, the insidious advances of the man with the allegorical axe to grind; but, at the same time, the true spirit of independence and the germ of ultimate success must be preserved, in a straightforward, dignified and manly way.

The refusal of the Commissioners of the District of Columbia to permit the Mutual Union to stretch their wires over the city, and the experiment now being made by that company of running cables through the sewers, might reasonably open up the question once more as to whether it is advisable or not to abolish all wires in cities—

overhead and underground—or at least in cities where there are not more than half-a-dozen branch offices. A main office far out in the suburbs, where all the relaying could be done, with the through wires only skirting the city limits, and with pneumatic tubes from that main office to the various branch offices in town, are possible even if not deemed quite practicable. The saving in rent and taxes on a huge building in the crowded portion of a city would be an item worth considering, while the plan, if feasible, would certainly solve the problem of underground wires in cities. When A works direct to C via B, there seems to be no good reason why the “through” connection should not be made in the suburbs of the latter place, without describing a totally unnecessary “loop” over six or seven miles of poles in that town.

As the season of summer vacations is upon us, every operator who can at all afford it should arrange for a short respite from his customary worry and work. Even if it should cost a few dollars extra, the outlay will be fully returned in the additional vitality and spirit gained by a brief change from the interminable number of reds and blacks, and duplexes and quads, to the quiet country lanes, the odor of the honey-suckle, the ripple of the stream and the singing of the birds. In all cases it would be a proper thing for managers—the new managers, at least, if the altruistic spirit has not yet penetrated the rhinoceros-like hide of the old ones—to make it as easy as possible for those who desire to take a run into the country for a few days. The consolidated companies have, in the main, a class of operators who are both capable and willing to work, to whom they are indebted for much of their past and present prosperity, and it would be only a fair acknowledgement of these facts for the managers to deal liberally in the matter of temporarily shortening hours or of otherwise giving aid to those who intend taking a brief period of relaxation.

THE Direct Cable Company and the *Evening Telegram* of this city seem to be justly proud of a recent feat in rapid telegraphy, by which the result of the Derby race in England was announced here in advance of all other mediums of communication. *The Telegram*, with its usual enterprise, had an operator and instrument on the grand stand at Epsom. The remainder of the story is thus recorded: “Horses got away at 10.21, 5, New York time. Iroquois passed winning post 10.23, 55, New York time. Result reached New York 10.24. Time occupied in transmission 5 seconds. Within four minutes, absolute time, from the moment the winning colt passed the wire, the news was going into type in New York.” *The Telegram* is certainly excusable for indulging this time in a modest boast at the expense of its rivals, while the admirable management in the Direct Cable Company’s offices, which renders such a feat possible, may be laid to heart with advantage by President Doren and the other officers of the coming American cable.

AMID all the push and enterprise of the telegraph the Bourbons still keep popping up to the front. In Paris, last month, thirteen dispatches from Tunis to the London *Standard* were “stopped” and the price was returned to the correspondent, a proceeding which the *Standard* justly pronounces worthy of the worst days of the second empire. On this continent, since the Princess Louise was stood on her head in a snow-bank by a runaway sleighing team, and the

Governor-General, the Marquis of Lorne, caused all reports of the circumstance to be “stopped,” we had supposed that telegraphic Bourbonism was dead. But it is now heard of once more on the cable connecting the United States and Mexico. It seems that press dispatches sent over that cable must be addressed, not to the various newspapers, but to Don Ramon Guzman, who submits them to the *Diario Oficial*, so as not to “irritate the Government.” There seems to be too much government or entirely too much Don Ramon Guzman down in Mexico for the good of American telegraphy.

It will interest readers to know that a representative of THE OPERATOR will leave New York for Paris early in July, and remain in that city during the whole of the electrical exhibition. He will send us for each issue a descriptive letter from personal observation, giving everything in reference to the several exhibits that readers of THE OPERATOR will be likely to feel interested in. It will doubtless be impossible to do justice to the subject in a few letters, but the articles will be continued even after the close of the exhibition. It is thus hoped that such American telegraphers as cannot make it convenient to visit Paris on this occasion, will, through the enterprise of THE OPERATOR, be kept informed of what goes on there.

A BABY was born in the steerage of the steamship *Germanic* during Mr. William H. Vanderbilt’s last trip from Liverpool. Those who entertain exaggerated views with regard to that gentleman’s hard heart will do well to study the text of this note: “Give this poor woman the best medical attendance you can and the best of treatment and nourishment, and send the bill to me, W. H. Vanderbilt.” Out of gratitude the little waif of the ocean was christened “Mary Germanic Vanderbilt Phillips.” Mr. Jay Gould being, as he testified in the Williams suit, “a little lame,” was rather short on this nautical deal; but his charitable heart may see us later—and, then again, perhaps, it may not.

THE English operators, who have been agitating for an amelioration of their condition since Christmas, have hitherto confined their efforts to protests by local associations. But, since the redress sought seems to be as far away as ever, there is a disposition now to form a general union of the entire fraternity, and a strike is not a very remote possibility. There are 5,000 operators in the service (1,800 of them women); there are no rival companies from which the Government could draw assistance, and there is no floating reserve of operators, so that a determined and general movement would be sure to bring speedy relief.

THE cable steamer *Faraday*, which on the 29th ult. completed the laying of the western portion of the first of the two new American cables from Canso, Nova Scotia, has arrived back at Penzance, England. The work of laying the eastern end will be proceeded with at once, and the whole cable will be in working order probably by next September.

She has already laid the Eastern or European end, and will now proceed to sea to lay the deep portion, and thus connect Canso Bay on this side with Whitesend Bay, in Cornwall, near the Land’s End, England.

THE Directors of the Western Union Telegraph Company have declared another quarterly dividend of 1½ per cent., payable whenever the

courts will permit. This makes 3 per cent. in all now due the stockholders. Holders of the company’s certificates of indebtedness are to receive the same amount as stockholders. The statement of the business for the six months ending June 30 shows net earnings amounting to \$3,536,803, out of which is to be deducted for interest, sinking fund and construction \$818,698, leaving for dividends \$2,718,105, or nearly 5¼ per cent. on a capital of \$80,000,000.

THAT box of “stored electricity,” or condenser, perfected by Camille Faure, seems to have created a sensation. It appears that by its use, while the electric light cannot be subdivided, a difference of intensity can be made in the light at will. During a recent test of Mr. Faure’s battery, in Paris, a little canoe called “The Telephone,” was sailed up and down the Seine, driven by one of the “accumulators.” The Faure battery has not yet been granted an American patent.

THE over-sanguine manner in which some of our august legislative bodies threatened dire consequences to the telegraphic consolidation convinced us that they would speedily cool off. In no State was the anti-monopoly feeling more pronounced among local statesmen than in Pennsylvania; yet, when the Assembly of that State adjourned *sine die*, on the 9th inst., the Telegraph Anti-Consolidation bill was left unacted upon.

THAT is an interesting telegraphic item from Russia which says that all the telegraph officials near the Gatchina Railway have been arrested, owing to the discovery of an infernal machine under the rails, connected by wires with a battery in the telegraph office. We should not be surprised to hear that those operators have had their salaries reduced.

THE telegraphic ability of our British cousins shines forth in all its effulgence in the London *Post*, *Standard*, and other papers, just to hand, which in their American dispatches announce the death at Philadelphia of “Thomas Ascott, ex-President of the Pennsylvania Railroad.” Premier G. Ladstone should call the attention of P. Arliament to this kind of telegraphing.

THE Pennsylvania Railroad, which pays its operators probably more beggarly salaries than any other railroad company in America, has recently killed two men by the carelessness of one of its operators, and in the ensuing bill of damages it will be likely to pay more than would maintain a whole telegraphic tribe for a year.

A NEW semi-monthly telegraphic paper, called *L’Electricien*, excellent in form and general make-up, has appeared in Paris. It is edited by a committee of which the celebrated electrician, M. Hospitalier, is the secretary, and it contains a great amount of information valuable to the profession at large.

It has been definitely ascertained that the cost of producing electric light by incandescence is, at the present time, greater than that of producing gaslight in the proportion of 1,500 to 992.

THE formation of new competing companies is still reported. It’s a cold day when we don’t hear of at least one, and out of the lot we ought ultimately to find a live and *bona fide* opposition.

WESTERN UNION stock is quoted at 133. Last issue it was 129.

### The Burning of the Nashville Office.

To the Editor of The Operator:

SIR: Our handsome new office is in ashes, and all of us are in mourning. A paint and oil house on the opposite side of the street caught fire about ten o'clock on the morning of May 17, and before we could realize any danger our building had taken fire. A favorable wind and everything as dry as tinder made quick work of what was undoubtedly the most complete and comfortably arranged office in the South. A few parts of instrument sets, the three box relays used at the switch board, and the switch board itself was all that could be saved from the third floor. The second floor was occupied by General Superintendent Trabue, District Superintendent Compton and Assistant Superintendent Tree, neither of whom saved anything. Many of the records, etc., were thrown out of the windows into the street, but were burned before they could be reached. The loss will entail greater inconvenience upon Mr. Tree than either of the others, as his files of records were the work of many years of the most careful and systematic preparation, and I very much doubt if there was another superintendent anywhere who had such a thoroughly complete set of records as Mr. Tree.

Harmon Stewart, our chief, is also greatly deserving of sympathy. It had been but six weeks since he had, after a month's very hard work, finished running the wires and arranging the new operating room. His work was such as any one would be proud of, gaining high compliments from all who saw it. To have all this destroyed in an hour was discouraging in the extreme.

Wires were at once run into the old tumble-down building we had just vacated, and in a few days, as one of the boys remarked, "Our new office was but a dream."

In our present quarters, appearances would indicate camp-life. Battery stands, with five and six hundred cups, are on the same floor as the receiving department; the second floor having been altered, the usual stairway was cut off, and we hazard our necks and limbs up a narrow, crooked back stairway to the third floor, which is now more untenable than ever. The back part of the second floor, which was our former battery room, is now occupied by Superintendents Compton and Tree and Manager Fisher. They are, however, minus their nice desks, using instead, dollar-and-a-half poplar tables. A passer-by might easily mistake it for the sanctum of a country newspaper editor. General Superintendent Trabue and his two gentlemanly clerks, Messrs. Crowley and Overton, found desk room in an insurance office across the way. Manager Fisher was rather more fortunate. By running considerable risk, and by getting his hands pretty well scorched, he managed to save his most important books and papers.

The property owners in the burnt district, with commendable pluck and energy, are already clearing the debris preparatory to rebuilding, and by Christmas we hope to be fully settled in another new and pleasant office.

I ought to mention that of the twenty-five or thirty men connected with the office, every one I have yet met was the last one to leave the burning building, except, perhaps, Harvey Pride, who says he tried hard to be the first, but could not make it.

NASHVILLE, Tenn., June 5, 1881.

### New Haven (Conn.) Notes.

To the Editor of The Operator:

SIR: Telegraphic matters in the City of Elms for the last two months have been quite exciting. The A. & P. office was closed April 1. Mr. M. J. Mallahan, manager, was offered a position by the W. U., but declined, wishing to take a vacation. Mr. J. F. Malone (our Philadelphian) night press man for N. A. P., was transferred to the W. U. office, same position. Mr. A. P. Foley, day operator, transferred to the Union depot, vice Mr. E. Miller, who accepted a position with W. T. Hatch & Sons, of New York, at their branch office, this city. The American Union Company's office was kept open until June 1. Mr. Hendricks, manager, being transferred to New York, same company. Mr. M. C. Denison, operator, is still at A. U. office, in charge of wires for testing only until the cable arrives to transfer wires to W. U., when he will be given a

a position there. At the Western Union J. Murray Fairchild, for twenty years manager of the W. U. office, has resigned. His retirement from the management of the office was generally regretted, both by the force under his charge and by the citizens generally. He has accepted a position with the New Haven Electric Light Company, with whom he has a contract for a number of years, and the superintendency of the New Haven City Fire Alarm. On May 31 he was presented (informally) by A. Osborn Bailey, on behalf of the fraternity, with a heavy solid gold shield. Mr. Fairchild was much pleased at this friendly recognition on the part of his late subordinates. W. H. Fairchild, for many years cashier and operator same company, this city, has also resigned. He, too, had many friends, and his retirement was generally regretted by the telegraphic fraternity of the city. It is understood that he is also to go with the New Haven Electric Light Co.
